ORGANIC and PHYSICAL chemist, Ph.D., Ch.E., desires research or teaching position with opportunity for research. Fifteen years' research and teaching experience at large university (Ass't Professor) and research institutes, teaching graduate courses and directing Ph.D. researches. Numerous publications in physical and organic chemistry. Research involves absorption and emission-spectra, fluorescence, Raman-spectra, polarography, optical activity, calorimetry and their applications to organic, biological or nutrition problems. Organic synthesis, especially pyrrole pigments, qualitative and quantitative organic microanalysis. Administrative ability. First citizenship papers, age 42, married. Christian. Employed, available within reasonable notice. Location immaterial.
Box 43 T-5, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHER desires to obtain position teaching chemistry only. Nine years' successful experience teaching general, qualitative and organic in college and engineering school. Now teaching chemistry and other sciences Present position permanent. Would be pleased to have opportunity to do research while teaching. Good recommendations. Ph.D. 1935 Major, organic; minor, general chemistry. Good background in other sciences. Publications. Membership: Sigma Xi, Phi Lambda Upsilon. Protestant, family.
Box 46-T-5, Ind. & Eng. Chem., Easton, Pa

ASSISTANT PROFESSORSHIP in chemical engineering wanted by chemical engineer, M.S., now employed in industry but who prefers teaching. Age 36, class 3A, industrial and teaching experience. East, south, or middle west.
Box 47-T-5, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL RESEARCH, development position wanted by Ph.D., physical chemistry, 1941 Doctoral research in precision calorimetry. Publications. Year experience in plastics. Phi Beta Kappa, Sigma Xi. Age 25. Married. 3-A draft classification. Willing locate anywhere.
Box 54-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. B.S. 20 years' varied experience in research pilot plant development, design and plant control in the fields of oil refinery, gas and by-products, and production of organic chemicals.
Box 56-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: B.S. Chemistry, M.S. Biochemistry. Three years' graduate research on sulfite waste utilisation, 4 months experience in experiment station, 17 months in soil mechanics, 20 months in paper mill on research and pollution. Desires work more directly connected with war effort. Age 29. Draft 3A. Prefers West or Mid-west.
Box 57-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. in biochemistry. Experience in synthesis, isolation of vitamins, amino acids, other biochemicals, development protein and vitamin analyses. Publications, patent applications, Sigma Xi. Interested in research development for war production.
Box 58-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: Two years' of graduate work toward M.A. Desires position in production and development of organic chemicals in war production plant. Some analytical and production experience. Age 25, married. Draft deferred. Employed. Location immaterial. Available on short notice.
Box 64-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH chemist, Ph.D. 1934, age 35, married. Experienced in industrial research methods. Twelve-year background of teaching, synthetic organic research and developments in viscose, cellulose derivatives and protective coatings. Capable of directing established research activities or organising and supervising such work in pioneer fields. Interested only in a permanent connection requiring outstanding ability and application with an organization recognised for its sound achievement, business integrity and financial stability.
Box 60-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Cornell, B.Chem. 1939, Ch.E. 1940, single 23. Two years' experience development work on organic chemicals, methanol, ammonia. Any location, available immediately. Defense work preferred; principally interested in process development, improvement of existing processes; production if defense industry.
Box 66-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Research experience in sterols and synthetic organic. Seek industrial position in organic research or development, preferably for war effort. Sigma Xi. 29, 2-A.
Box 67-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1938, Age 28, single. Employed by Government, desires research position in industry. Experience includes synthetic organic chemistry, organic microanalysis, sterol research, biochemical research. Available on short notice
Box 72-T-5, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.S., M.S. in Biochemistry and nutrition. 2½ yrs. experience in vitamin chemistry, vitamin preparations, and fluorometric assaying of thiamin and riboflavin. Also holds N. J. Secondary Teacher's Certificate.
Box 74-T-5, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., desires work in research or development. Researches in kinetics, high vacuum, electrochemistry. Now working in radio tube factory, thermionic emission, production development of direct emission filaments. Good background in physics, mathematics. 29, married, English born, American citizen. Phi Lambda Upsilon, publication.
Box 76-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. 1940, industrial production, analytical, and investigative experience, with wide responsibilities. Desires research, development, or production in organic field, with company contributing to war effort. Twice classified 2A. Age 24 Presently employed.
Box 77-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S., one year industrial experience, desires position in research, production, or development, preferably organic. Eastern location, particularly New Jersey, preferred. Age 27, single, favorable draft status. Available immediately.
Box 81-T-5, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D., 1942. Excellent background in physiological chemistry, organic chemistry and physiology. Courses in toxicology, bioassays, spectroscopy and microanalysis. Research experience in fatty acids and human fat Interested in organic or biochemical research. Single, 27, draft 2-A, Sigma Xi, Phi Lambda Upsilon.
Box 82-T-5, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

PLANT SUPERINTENDENT, experienced in design, erection, operation and technical direction of vegetable oil plant manufacturing refined and hydrogenated oils, Oleomargine, Mayonnaise, Distilled Fatty Acids and Crude Glycerine.
Box 44-T-4, Ind. & Eng. Chem., Easton, Pa.

EMPLOYMENT in BRAZIL wanted either as chemist or in management. A.B. 1934 Stanford, chemistry major. No experience. Seven years manager wholesale oil distribution. Consistent money making record. Speak Spanish. Read Spanish, German, some French. Studying Portuguese. Alpha Chi Sigma. Age 29. Draft 1-B. Married. Excellent references. Salary immaterial.
Box 25-N-5. Ind. & Eng. Chem., Easton, Pa.

CHEMICAL LIBRARY position desired by woman-chemist. Wide experience in literature and patent searching. Good scientific and technical background. Fluent use of scientific Russian, Ukrainian, French and German. Typing.
Box 17-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S. May 1942. Organic, physical, analytical, micro and physiological chemistry. Background in physics and bacteriology. Undergraduate research in chrome ore analysis. Available immediately. Excellent references. Draft status unclassified.
Box 30-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. Recent M.S., A.C.S. accredited university. Good knowledge of physical chemistry. Members Sigma Pi Sigma, Phi Lambda Upsilon, Sigma Xi. Experience in synthetic resins. Desire position in defense industry, research preferred. Now employed.
Box 35-T-5, Ind. & Eng. Chem., Easton, Pa.

LIBRARIAN, B.S. in chemistry, M.S. in Library Science, married, age 31, 3-A. Highly trained and skilled in acquiring, assembling and searching scientific and research literature. Executive ability; business experience. Present position, head librarian, University. Will consider asking leave of absence for duration if position open in vital war industry or agency.
Box 37-T-5, Ind. & Eng. Chem., Easton, Pa.

SPECTROGRAPHIC ANALYST; white, male, finishing ESMDT spectroscopy, U. S. C., no experience, Protestant, 56, married, B.S. '09, salary your schedule, location non-essential.
Box 39-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: B.S. in April 1942 University of Pittsburgh. Received "A" grades in bacteriology, inorganic, organic, Analytical (qual. and quan.) chemistry. Ordnance material testing and inspection, advanced metallurgical analysis, physics, mathematics. Had first year in medical school at Pitt. Seven months experience in hospital laboratory as medical technician. Location immaterial; single, age 27, available immediately, reclassified to 4F (poor vision 20/200) in left eye, right eye normal. Desire industrial or pharmaceutical work.
Box 48-T-5, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST. With background of physics, mathematics and radio. Age 29; A.B. 1935. At present employed but desires position with greater advancement. Four years' experience in analytical testing. West coast position preferred.
Box 59-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST and ENGINEER 20 years' experience research management and sales—starches, gums, and dextrins, animal glues, colloids, foods, sizing and finishing materials, animal and mineral oils, waxes, textile chemicals, enzymes, and synthetics. M.I.T. graduate.
Box 61-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST 19 years' experience oils and allied lines, sulfonations, synthetics, detergents, emulsions, bases for emulsifying mineral oils and glycerides, resins, textile chemicals, water proofing compounds, adhesives, waxes, carbohydrates, and proteins. Desires position requiring broad experience in research and production.
Box 62-T-5, Ind. & Eng. Chem., Easton, Pa.

TEACHING POSITION wanted—preferably small college in midwest or south. M.S. degree biochemistry (1940). Advanced work in organic, bacteriology. Three years' graduate school. Many hours over M.S. Two years' director small nutrition research laboratory. 29, married, draft 3A.
Box 69 T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B. of Ch.E. 1940. Experienced in Chemical Economics as preparing consolidated breakdown statements of raw materials for priorities, standard and cost analysis, power conservation, production scheduling. Employed by large organic manufacturer. Desires similar position in N.Y.C. or vicinity. Age 25, Draft 3A.
Box 75-T-5, Ind. & Eng. Chem., Easton, Pa.

Hydrion Wide-Range pH Test Paper

R. P. CARGILLE, 118 Liberty St., New York, announces a new technique for checking the pH of solutions against his Hydrion wide-range pH test paper.

A complete line of buffers, for comparison with the unknown, known as the Cargille buffer set No. 1, has been developed. Solutions of known pH, made by dissolving the tablets in this set, are applied to the test paper to bring out on the paper the color for any half unit from pH 3 to pH 11. The colors are used for reference to judge the pH of the sample being tested; comparisons made with these reference colors are more accurate than those made with color charts. Readings can be made to one-half pH unit.

The new unit is designed for control tests in the plant by unskilled workmen; and for quick, preliminary tests in laboratories where more elaborate pH apparatus is available.

The buffer set is priced at $3.00; the Hydrion unit at $1.50.

MISCELLANEOUS

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke. 866 Fifth Avenue, New York, N. Y.

WANTED TO PURCHASE

General and Special equipment for steel-work analytical laboratory. State detailed inventory and cash prices.

Box 77-N-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: Mellor's "Comprehensive Treatise on Inorganic and Theoretical Chemistry," complete set or separate volumes; "Der Aufbau der Zweistoffleigerungen."
Box 18-T-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: 500 to 1000 lbs. of secondary octyl alcohol (methyl hexyl carbinol) up to 50 gals. of diethyl carbinol, 100 lbs. of diethyl ketone, up to 2000 lbs. of caprie acid, 10 grams. Thujone. Quote prices.
Box 31 T-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: 10 kilos Asparagine, 100 kilos Xylos, 100 kilos Sodium cacodylate, 500 grams Tryptophane, 500 grams Rhenium metal or salts also Acrylic, Glucuronic, Glutamic, Maleic, Malonic, Sebacic acids, 50 kilos Levulose.
Box 71-T-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: FILTER press. New or used plate and frame press; iron, rubber coated or wood. 1-2 cu. ft. capacity; enclosed discharge; suitable for washing cake. Reply giving description and price. Box 769, Kansas City, Mo.

WE WANT to BUY. Offer us all your surplus laboratory equipment in any quantity or complete laboratories. We are in urgent need of all types of instruments and apparatus. We are willing to pay the fairest price in many instances more than what we have sold most of the same equipment for. Please list and send promptly via air-mail to save time. Urgently needed are microscopes, Abbe refractometers, balances, polarimeters, Saccharimeters, Spectroscopes, Microscopic accessories etc. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

For Sale
CRESYLIC ACID
William D. Neuberg Company
420 Lexington Ave. New York, N. Y.
Telephone LE 2-3324

FOR SALE: Industrial and Engineering Chemistry, Industrial edition, vols. 1-33 (1909-1941). Complete. Unbound. Excellent condition.
Box 19-T-5, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Berichte Deutschen Chemischen Gesellschaft years 1873-1920 bound. Zeitschrift Physikalische Chemie vols. 1-75, bound. American Journal of Physiology 1899-1937. Tigerstedt, Handbuch Physiologische Methodik 1912, 3 vols.
Box 55-T-5, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Commercial laboratory. Business principally metallurgical. Very active. Splendidly equipped. Centrally located. Long record of big earnings and accomplishments. Unusual opportunity for competent metallurgical chemist. Health forcing retirement.
Box 63-T-5, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: 5000 tons Volcanic ash, 100 tons Red Jasper large lumps, 1000 tons Olivine, 500 tons Celestite, 1000 lbs Columbite 70% Cb205, 100 lbs Wolframite specimen lumps, Luminous pigments for Blackout & display, Black light U. V. lamps $18.00.
Box 70-T-5, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Spencer Compound Microscope with four and sixteen millimeter objectives, oil emersion lense, Abbe Condensor, three Oculars, Mechanical Stage, Vertical Illuminator, and glass bell jar, like new. The Perkins Laboratories Omaha, Nebraska.

FOR SALE: Immediate delivery subject to prior sale, Spencer Binnocular Microscope, (3) B & L Microscopes, (2) B & L Dubosq Colorimeters, (3) International Centrifuges with all accessories, Schmidt & Haensch Polarimeter, Saccharimeter, (5) Horisontal Sterilising Autoclaves for gas or steam, (3) Large incubators, (3) Freas Ovens, (2) Multiple unit organic combustion Furnaces, Gaertner Micrometer Microscopes, Labtest hydraulic presses 6 × 6 self contained with or without heating plates, 12 × 12 × 10 single wall drying ovens, analytical balances, Barnstead Water stills electric, Hanovia Quarts lamps, (9) various types torsion balances, (3) vacuum ovens, De-Laval purifiers and clarifiers, vacuum pumps, Microtomes and many other offerings in standard laboratory equipment. Fully guaranteed. Write us your requirements. Immediate attention to all inquiries. The Laboratory Exchange, 24 E. 21st. St., N. Y. C.

FOR SALE: Need balances? We are offering new (never used) laboratory pulp balances in polished mahogany case with sliding cointerpoised door made by a national firm. 100 gr. capacity, 1 mg sensitivity. A splendid opportunity to purchase these fine balances while still available. Reduced to $27.50. Order promptly to assure delivery. Subject to prior sale. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

Direct Blackening Process for Copper and Copper Alloys

THE Enthone Co., 442 Elm St., New Haven, Conn., has developed a new process called Ebonol "C" for direct, low-temperature, chemical blackening of copper and copper alloys. The process involves immersion in a solution of blackening salts operated near the boiling point or from 200° to 212° F., and the blackening is accomplished in from 2 to 10 minutes, depending upon the alloy being blackened.

The process is stated to be suitable for blackening copper, beryllium copper, bronze, phosphor bronze, and brasses with zinc contents of 35 per cent or less. The coating is essentially cupric oxide, and being integral with the base metal, it cannot chip or flake. It is hard enough to be buffed and does not have to be lacquered to prevent wear.

Conservation

JOBBERS are playing an important part in the planned conservation campaign being conducted by Manning, Maxwell & Moore, Inc., Bridgeport, Conn. Each month they distribute folders telling how to make the company's products and competitive products last longer.

Plastic Spacers

NEW plastic spacers are reported to save brass and steel and to speed up milling machine operations in the manufacture of airplanes, locomotives, electrical equipment, pneumatic and precision tools, and other goods.

The spacers are made in thicknesses from 0.001 to 0.020 inch with hole diameters as high as 2 inches with standard keyways. Larger sizes with outside diameters up to 10 inches may be had on order.

They are made by Industrial Products Suppliers, New York, from "Plastacele", cellulose acetate plastic of the Plastics Department of the Du Pont Company.

HARRISON E. HOWE, Editor
PUBLISHED BY THE AMERICAN CHEMICAL SOCIETY
VOLUME 20 JUNE 10, 1942 NUMBER 11

PRELIMINARY PROGRAM
Buffalo Meeting, American Chemical Society

September 7 to 11, 1942

General Program

REGISTRATION and most divisional meetings will be held in the Hotel Statler, which will be convention headquarters. The general meeting will be held in the new Municipal Auditorium which is within walking distance of the convention hotels.

Sunday, September 6

2:00 to 9:00 P. M.—Registration, Mezzanine Floor, Hotel Statler.
8:00 to 10:00 P. M.—Social period.

Monday, September 7

8:00 A. M. to 6:00 P. M.—Registration.
9:30 A. M.—Council meeting.
12:15 P. M.—Group luncheons.
2:00 P. M.—General meeting, Municipal Auditorium.
6:30 P. M.—Group dinners.
8:15 P. M.—Strenuous entertainment, Municipal Auditorium.

Tuesday, September 8

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.
6:30 P. M.—Group dinners.
8:30 P. M.—Entertainment for benefit of the intellectuals.

Wednesday, September 9

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.
7:00 P. M.—Subscription dinner.
9:30 P. M.—Dance, open to all registrants.

Thursday, September 10

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.
6:30 P. M.—Group dinners.

Friday, September 11

7:30 A. M.—Group breakfasts.
8:00 A. M. to 12:00 M.—Registration.
9:00 A. M.—Divisional meetings.
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.

Local Committee Chairmen

Chairman. Nelson Allen, E. I. du Pont de Nemours & Co., Inc., Station B, Buffalo, N. Y.
Vice Chairman. Wilmer H. Koch.
Secretary. Hans O. Kauffmann.

Executive Committee. Nelson Allen, Lawrence H. Flett, Hans O. Kauffmann, Wilmer H. Koch, Howard W. Post, and J. Frederic Walker, Jr.

ENTERTAINMENT. Raymond R. Ridgway.
FINANCE. Max E. Bretschger.
GOLF. Joseph S. Reichert.
GROUP MEALS. Warren K. Eglof, Department of Chemistry, Niagara University, Niagara University, N. Y.
HOTELS AND HOUSING. Edward F. Wesp.
INFORMATION. James H. Crowdle.
LADIES ENTERTAINMENT. Margaret C. Swisher.
MEETING PLACES AND EQUIPMENT. Ralph B. Elliott, Electrochemicals Department, E. I. du Pont de Nemours & Co., Inc., Niagara Falls, N. Y.
PLANT VISITS. Robert L. Murray.
PRINTING. Walter M. Buehl.
PUBLICITY. Robert M. Fowler.
RECEPTION. Lester Francis Hoyt.
REGISTRATION. George W. Fiero.
SIGNS. G. E. Symons.
STUDENTS. Groves H. Cartledge.
SUBSCRIPTION DINNER. Albert E. Jennings, Jr.
TRANSPORTATION. Donald E. Drew.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training. Future developments will be brought to the attention of our readers.

Ladies Program

Headquarters—Hotel Statler

In order to afford ladies with children more opportunity to participate in meeting activities, a nursery school will be maintained in the Hotel Statler. It will be under the direction of Mrs. Mary B. Parke, director of the Nursery School at the University of Buffalo.

Sunday, September 6

2:00 to 9:00 P. M.—Registration, Mezzanine Floor, Hotel Statler.
2:00 to 5:00 P. M.—Ladies headquarters will be open.
8:00 to 10:00 P. M.—Social period.

To members attending the A. C. S. Buffalo meeting: Make your reservations *early*.

The AMERICAN CHEMICAL SOCIETY assumes no responsibility for the statements and opinions advanced by contributors to its publications.
Published by the AMERICAN CHEMICAL SOCIETY, Publication Office, 20th & Northampton Sts., Easton, Penna. Editorial Office, 1155 16th St., N. W., Washington, D. C.; Telephone, Republic 5301; Cable, Jiechem (Washington). Advertising Department, 332 West 42nd St., New York, N. Y.; Telephone, Bryant 9-4430. Entered as second-class matter at the Post Office at Easton, Penna., under the act of March 3, 1879, as 24 times a year on the 10th and 25th. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized July 13, 1918.
Annual subscription rate, $2.00. Foreign postage to countries not in the Pan American Union, $0.60; Canadian postage, $0.20. Single copies, $0.15. Special rates to members.
No claims can be allowed for copies of journals lost in the mails unless such claims are received within 60 days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days' advance notice required.) "Missing from files" cannot be accepted as the reason for honoring a claim. Charles L. Parsons, Business Manager, 1155 16th St., N. W., Washington, D. C., U. S. A.

Vice-Chairman Koch

Chairman Allen

Secretary Kauffmann

Executive Committee Member
L. Post

Executive Committee Member
Flett

Monday, September 7

8:00 A. M. to 6:00 P. M.—Registration.

3:00 to 5:00 P. M.—Tea and reception in honor of the wives of the officers of the AMERICAN CHEMICAL SOCIETY, Hotel Statler.

8:15 P. M.—Entertainment, Municipal Auditorium.

Tuesday, September 8

11:00 A. M. to 4:30 P. M.—Trip to Museum of Science via Zoo, Historical Building, Albright Art Gallery. Lunch at the Museum at 1:00 P. M.

1:00 to 4:30 P. M.—Trip to the Museum of Science. Tea at the Museum.

1:30 to 4:30 P. M.—Trip to the Albright Art Gallery and the Historical Building. Tea at the Art Gallery.

8:30 P. M.—Entertainment.

Wednesday, September 9

1:00 to 3:00 P. M.—Luncheon and entertainment at the 20th Century Club.

7:00 P. M.—Subscription dinner.

9:30 P. M.—Dance, open to all registrants.

Thursday, September 10

10:30 A. M. to 5:00 P. M.—Trip to Niagara Falls. Luncheon at Niagara Falls Country Club at 1:00 P. M.

Registration

The registration headquarters of the meeting will open at 2:00 P. M. Sunday on the Mezzanine Floor of the Hotel Statler, and will continue there throughout the meeting. The registration fee, required by vote of the Council to help carry local expenses, has been fixed at $3.00 for members and visitors other than American nonmember chemists and chemical engineers; $8.00 for American nonmember chemists and chemical engineers. All members and visitors must register. Admission to meetings will be restricted to those wearing official badges of this meeting.

Society Regulations Governing Registration

BYLAW 2. (*a*) Attendance at meetings of the SOCIETY is limited to registered persons.

(*b*) All persons in registering at meetings of the SOCIETY shall state whether or not they are members of the SOCIETY and, if not, whether they are chemists or chemical engineers.

(*c*) American chemists or chemical engineers, nonmembers of the SOCIETY, attending meetings of the SOCIETY, shall assist in the support of the facilities which they enjoy by paying a higher registration fee than members. This differential at general meetings shall be $5.00 higher than the fee charged members; while at regional and divisional meetings it shall be at least twice the regular fee adopted. They shall be furnished with a special nonmember badge to differentiate them from members of the SOCIETY and from foreign and nonchemist guests. The differential charged shall not apply to regularly matriculated students majoring in chemistry or chemical engineering at any college or university.

Executive Committee Member
Walker

(*d*) Meetings are normally open to all registrants, but any session may be closed to nonmembers of the SOCIETY by order of the President.

NOTE. Corporation members have the right to designate *one representative only* with membership privileges at each meeting. If a *corporation member* sends a substitute for the delegate of record, the Secretary's office should be informed by mail. In registering, such a representative should sign the corporation name, per his own as representative.

Associate members of local sections and of divisions are not members of the Society, and have no Society privileges; if chemists or chemical engineers, their registration fee is $8.00. All visitors, including children, regardless of age, who participate in any trips, luncheons, or other activities provided on either the men's or women's program, regardless of whether they are free or paid events, must pay the visitors' registration fee, $3.00, and wear the appropriate badge.

Official Hotels

Hotel[a]	Rates For One Person[b]	For Two Persons	Suites
Statler	$3.30 to $6.60	$5.50 to $11.00	$ 9.00 to $18.00
Lafayette	3.30 to 4.40	4.50 to 6.60	10.00 to 18.00
Ford	1.50 to 2.00	2.75 to 5.00	.....
Touraine	2.25 and 3.30	5.00 to 7.00	8.00 to 12.00

[a] Map showing location of hotels will be printed in the June 25 issue of CHEMICAL AND ENGINEERING NEWS.
[b] Limited in number. Double occupancy desirable.

Hotels

Hotel Statler, Niagara Square, has been designated as headquarters for the meeting. Hotel Lafayette, Washington and Clinton Streets, will be headquarters for the Division of Rubber Chemistry.

All official hotels are in or near the theater, shopping, and business district. They are readily accessible to all railway stations and steamer landings by taxicab, bus, or trolley.

Requests for reservations should be sent at once to Edward F. Wesp, Chairman, A. C. S. Hotels and Housing Committee, Buffalo Convention and Tourists Bureau, Genesee Building, Buffalo, N. Y. Please use the hotel reservation application on page 725, giving all the data requested.

Because of the present large demand for hotel rooms in Buffalo, it is imperative that reservations be made at the earliest possible date. For the same reason, double occupancy of rooms is desirable. Since defense activities are making a heavy call on Buffalo hotels, the convenience of a single room should be sacrificed as a patriotic contribution. It is in this spirit that the Hotels Committee asks that (1) hotel reservations be made early, giving the dates of arrival and departure, and (2) members arrange to share double rooms.

Rooms for students will be available at $1.00 per day and up.

Railroad Rates

Owing to the general reduction of railroad rates, railroads have discontinued the granting of reduced fares to conventions. However, there are substantial reductions in special round-trip fares from many cities. Consult your local ticket agent.

There is a great shortage of railroad equipment for movement of civilian traffic; *early reservation of space is essential.*

Addresses of Divisional Secretaries

Agricultural and Food Chemistry. Roger H. Lueck, Research Department, American Can Co., Maywood, Ill.

Analytical and Micro Chemistry. Francis W. Power, S. J., Fordham University, New York, N. Y.

Biological Chemistry. Erwin Brand, 630 West 168th St., New York, N. Y.

Cellulose Chemistry. Charles R. Fordyce, 275 Maplewood Drive, Rochester, N. Y.

Chemical Education. Paul H. Fall, Hiram College, Hiram, Ohio.

Colloid Chemistry. J. W. McBain, 571 Foothill, Stanford University, Calif.

Fertilizer Chemistry. Charles A. Butt, International Minerals & Chemical Corp., Box 69, East Point, Ga.

Gas and Fuel Chemistry. G. R. Yohe, State Geological Survey, Urbana, Ill.

History of Chemistry. Ralph E. Oesper, Department of Chemistry, University of Cincinnati, Cincinnati, Ohio.

Industrial and Engineering Chemistry. Whitney Weinrich, Gulf Research & Development Co., Box 2038, Pittsburgh, Penna.

Medicinal Chemistry. John H. Speer, Box 5110, Chicago, Ill.

Organic Chemistry. Arthur C. Cope, Department of Chemistry, Columbia University, New York, N. Y.

Paint, Varnish, and Plastics Chemistry. Adolf C. Elm, The New Jersey Zinc Co., Box 263, Palmerton, Penna.

Physical and Inorganic Chemistry. Oscar K. Rice, Department of Chemistry, University of North Carolina, Chapel Hill, N. C.

Rubber Chemistry. Howard I. Cramer, Sharples Chemicals, Inc., 23rd & Westmoreland Streets, Philadelphia, Penna.

Sugar Chemistry and Technology. E. Whitman Rice, National Sugar Refining Co., 129 Front St., New York, N. Y.

Water, Sewage, and Sanitation Chemistry. H. Gladys Swope, North Shore Sanitary District, Dahringer Road, Waukegan, Ill.

Papers for the Meeting

Titles for papers should be sent to the secretary of the appropriate division and *not to the Secretary of the Society. Titles to appear on the final program and abstracts, or complete papers where required, must be in the hands of the divisional secretaries no later than July 10.*

Society Regulations Governing Papers

BYLAW 3. (*a*) Papers by American chemists or chemical engineers not members of the SOCIETY shall not appear on the programs of general, divisional, or regional meetings of the SOCIETY unless they be joint papers with SOCIETY members.

(*b*) All papers presented before general, divisional, regional, group, local section, or other meetings are the property of the SOCIETY, to be published in the journals of the SOCIETY or released by the appropriate editor if not retained for such publication.

(*c*) The SOCIETY is not responsible for statements and opinions advanced by individuals in papers or discussions before its meetings.

(*d*) Any paper, although announced in the final program, may be excluded at any time prior to delivery by order of the President.

The Board of Directors has voted the following regulations (R-55) governing papers to be presented before general, divisional, regional, or group meetings, supplementing Bylaw 3:

(*a*) Authorship of papers shall be accredited only to individuals and not to companies or laboratories.

(*b*) No paper may be presented which has been offered for publication elsewhere.

(*c*) No paper, no matter how important, may be presented, the title of which does not appear on the final program.

(*d*) If a paper is declined by any division of the SOCIETY, the secretary of that division is instructed to notify the secretary of any other division to which it is likely to be offered.

Priority is based solely upon the date of receipt of the *complete* paper deposited for publication with the secretary of the division or the appropriate editor.

The Council has empowered officers of divisions to request any paper in advance, so that it may be passed upon and an indication made to the author as to whether he is to read the entire paper or to abstract it in order to give time for discussion.

No paper may be presented at the meeting, title for which is not printed in the final program.

"By title" should be placed on the announcement of any paper when the author is to be absent, so that members may understand in advance that the paper will not be read. All such papers should be placed at the end of the program.

Titles should be accompanied by information concerning desired projection equipment. Only standard lantern slide projectors will be furnished without cost.

Divisional Requirements

The Division of Agricultural and Food Chemistry requires that those wishing to present papers at the meeting submit, in duplicate, a 200-word abstract together with information regarding the time required for presentation of the paper. Abstracts should be accompanied by the name and address of the author (or authors), the name of the laboratory in which the work was done, and information regarding papers the author (or authors) plans to present before other divisions. Abstracts must be in the hands of the secretary not later than July 10. Authors should have a complete manuscript of their papers, ready for publication, to give to the secretary at the meeting. Planographed abstracts of the papers will be

Peace Bridge to Canada

sent to all members of the division about two weeks prior to the meeting.

The Division of Analytical and Micro Chemistry requires that authors who plan to present papers before the division return to the secretary not later than July 10 a form which lists the title of the paper, name and address of the author (or authors), name of the laboratory in which the work was done, time needed for informal presentation, a 200- to 250-word abstract, and one copy of the complete paper.

The Division of Biological Chemistry requires by July 10 a 200-word abstract in duplicate and information regarding the time required for presentation of the paper. If deemed necessary, the division may request a 1,000-word abstract or the complete manuscript. Abstracts will be sent to members of the division prior to the meeting.

The Division of Cellulose Chemistry requires that an abstract not to exceed 200 words and two copies of the manuscript be in the hands of the secretary on or before July 10. Two copies of the manuscript are necessary in order that the paper may be considered by the review committee within the time remaining between July 10 and the date on which the final program is submitted for publication.

The Division of Chemical Education requires by July 10 a 200-word abstract, the complete paper, and information on the time needed for presentation. Abstracts of all papers on the divisional program will be sent to members of the division in advance of the meeting.

The Division of Colloid Chemistry requires not later than July 10 three copies of an abstract of about 200 words. The complete manuscript should be handed to the secretary after the paper is presented.

The Division of Fertilizer Chemistry requires by July 10 an abstract not to exceed 250 words and information on the time needed for presentation. The manuscript should be submitted to the secretary on or before the date of presentation.

The Division of Gas and Fuel Chemistry requires not later than July 10 a 200-word abstract, the complete paper, and an estimate of the time needed for presentation.

The Division of the History of Chemistry requires that its secretary receive not later than July 10 the name of the author (or authors) with address and official connection at the time of the work reported, an abstract not to exceed 250 words, and information regarding the time required to present the paper. Earlier notification of intention to contribute will be appreciated. Membership in the division is not required. For reasons of economy, there will be no solicitation of papers. The complete manuscript should not be sent to the secretary. After the paper has been read, the manuscript, *prepared for publication*, should be submitted to the Editor of the *Journal of Chemical Education*.

The Division of Industrial and Engineering Chemistry requires the complete paper for submission to reviewers. It must be received by July 10 and accompanied by a 200-word abstract, the name of the laboratory in which the work was done, and information regarding the time requirement. The paper will be placed upon the final program only after receiving a favorable report from the reviewers. Manuscripts for the Unit Process Symposium should be sent to R. Norris Shreve, Chairman, Purdue University, West Lafayette, Ind.

The Division of Medicinal Chemistry requires that authors submit by July 10 the complete manuscript, three copies of a 200-word abstract, an estimate of the time needed for presentation, and the name of the laboratory in which the work was done. The executive committee has authority to accept or reject papers.

The Division of Organic Chemistry requires (1) a 200-word abstract, which must be typed in the space allotted on a form supplied by the secretary, and (2) a more extensive abstract of at least 1,000 words, or a copy of the manuscript in form for publication. Both must reach the secretary by July 10, after which no additions, changes, or withdrawals of papers can be made.

The Division of Paint, Varnish, and Plastics Chemistry requires that those wishing to present papers at the meeting send the title and two copies of an abstract to the secretary before July 10. Two copies of the complete paper should be

One of Buffalo's beautiful parks

sent to the secretary before July 15, and preferably not later than July 1.

The Division of Physical and Inorganic Chemistry requires that titles for papers be accompanied by an abstract of approximately 100 words for distribution to the members of the division, and the complete manuscript or another abstract of 1,000 words. The short abstracts should follow the form used in the sets of planographed abstracts for previous meetings; please refer to a recent copy. The manuscript or long abstract will be returned only upon request made at time of transmittal. All material must reach the secretary before July 10, and no alterations or additions may be made thereafter. No title will be placed upon the program unless an author expects to be present to give the paper.

The Division of Rubber Chemistry requires by July 10 three copies of an abstract of 200 to 250 words, an estimate of the time needed for presentation, and the name of the laboratory in which the work was done. Three copies of the complete manuscript must be submitted to the secretary on or prior to the date of presentation.

The Division of Sugar Chemistry and Technology requires a 100- to 200-word abstract, to be submitted not later than July 10.

The Division of Water, Sewage, and Sanitation Chemistry requires by July 10 five copies of a 250-word abstract, two copies of the complete paper, and information regarding time required for presentation and the laboratory from which the paper originates. The abstracts will be sent to members of the division prior to the meeting.

Publication of Papers

BYLAW 3 (*b*). All papers presented before general, divisional, regional, group, local section, or other meetings are the property of the SOCIETY, to be published in the journals of the SOCIETY or released by the appropriate editor if not retained for such publication.

If release is desired, address the editor of the appropriate journal—i. e., H. E. Howe, A. B. Lamb, S. C. Lind, N. W. Rakestraw, or W. Albert Noyes, Jr. When the paper is in their hands, the editors will act promptly on any release requested.

Abstracts of Papers

Abstracts should accompany all titles when sent to the secretaries of the various divisions. Many of the secretaries complain that they are caused embarrassment through the nonarrival or late arrival of titles and abstracts. Members are urged to comply with this request in order to facilitate prompt distribution of sets of abstracts by the News Service.

Sets of Abstracts

Frequently there is a considerable period between the presentation of a paper and its publication, and in such cases the abstracts are of particular value.

The A. C. S. News Service, 1155 16th St., N. W., Washington, D. C., will supply abstracts of papers presented at the

Divisional Programs

DIVISION	NUMBER OF SESSIONS	PROGRAMS
Agricultural and Food Chemistry	6	Vitamins (with Division of Biological Chemistry). Chemical Aspects of Food Preservation by Canning, Dehydration, and Refrigeration. Processing of Foods for the Military Forces and Protection of Food against War Damage. General.
Analytical and Micro Chemistry	4	Teaching and Practice of Analytical Chemistry (with Division of Chemical Education). General.
Biological Chemistry	6	Vitamins (with Division of Agricultural and Food Chemistry). Proteins. General.
Cellulose Chemistry	4	General.
Chemical Education	4	Teaching and Practice of Analytical Chemistry (with Division of Analytical and Micro Chemistry). General.
Colloid Chemistry	2	General.
Fertilizer Chemistry	4	Potash, John W. Turrentine, Chairman. General.
Gas and Fuel Chemistry	3	Uses of Coal by Various Industries, H. J. Rose, Chairman. General.
History of Chemistry	2	General: Biographical and Historical. Exhibitions: Books, Pictures, Manuscripts, Historical Apparatus.
Industrial and Engineering Chemistry	5	Unit Process, R. Norris Shreve, Chairman. Administrative Problems of the Research Laboratory. The Manufacture and Use of Solvents. General.
Medicinal Chemistry	2	General.
Organic Chemistry	6	General.
Paint, Varnish, and Plastics Chemistry	4	Recent Developments in Drying Oils. General.
Physical and Inorganic Chemistry	12	Flow under Abnormal Conditions. Kinetics Using Tracer Isotopes. Low-temperature Phenomena and Critical Phenomena. General.
Rubber Chemistry	4	General.
Sugar Chemistry and Technology	2	General.
Water, Sewage, and Sanitation Chemistry	2	General.

Buffalo meeting. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors. The abstracts will be mailed as soon as possible after receipt of order, beginning about September 1, and will also be on sale at Buffalo.

This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.
To those without receipt for divisional dues, who remit with order, $1.00.
To those who fail to enclose remittance with order, necessitating correspondence, $1.25.
To those who require bills to be rendered, $1.50.

News Service

The A. C. S. News Service will have a press room in the Hotel Statler. Members who are to present papers will confer a great service and promote the efficiency of the publicity work by sending synopses to H. E. Howe, director of the News Service, 1155 16th St., N. W., Washington, D. C., as far in advance of the meeting as possible.

Group Meals

Arrangements for group breakfasts, luncheons, and dinners should be made with the Group Meals Committee and not with the hotels. All correspondence should be addressed to Warren K. Eglof, Department of Chemistry, Niagara University, Niagara University, N. Y. Requests, indicating expected attendance and preference as to time, must be submitted by July 1 in order to facilitate the work of the committee and avoid conflicts.

Equipment for Divisional Meeting Rooms

Divisional meeting rooms will be equipped with a standard lantern slide projector, screen, blackboard, pointer, chalk, reading stand, reading light, table, and ice water. Motion picture and other *special projectors can be furnished* upon the request and *at the expense of divisions if notice of such special needs is given* the Meeting Rooms Committee *before July 10*. Each secretary should contact his local assistant and inspect the assigned meeting room before the first session of the division. All correspondence concerning meeting rooms and equipment must be sent to Ralph B. Elliott, Electrochemicals Department, E. I. du Pont de Nemours & Co., Inc., Niagara Falls, N. Y.

Plant Trips

Because of wartime regulations affecting industrial plants working on government contracts, it is doubtful that any plant trips can be arranged. If conditions change, it may be possible to visit industrial operations. Buffalo chemists regret that they are unable to continue this interesting feature of national meetings.

Travel Information

Buffalo is very accessible. It is served by good motor roads, by several railroad and bus lines, by two major airlines, and by passenger boats on the Great Lakes. Service by public conveyances is frequent. A change in the usual method of travel, such as a trip by boat, may add to the visitor's pleasure. Those who find it possible to drive, may be interested to know that Canada has a moderate gas allowance for visitors.

Public transportation services are burdened by a tremendous increase in traffic and a decrease in facilities available to civilians. It is essential that those planning to attend the meeting *make reservations early* and buy tickets well in advance of departure. Otherwise, it may be impossible to secure travel accommodations. If tickets are not used, refund will be made by the railroad.

Local trains and busses to all points of the Niagara Frontier are readily accessible from the official hotels.

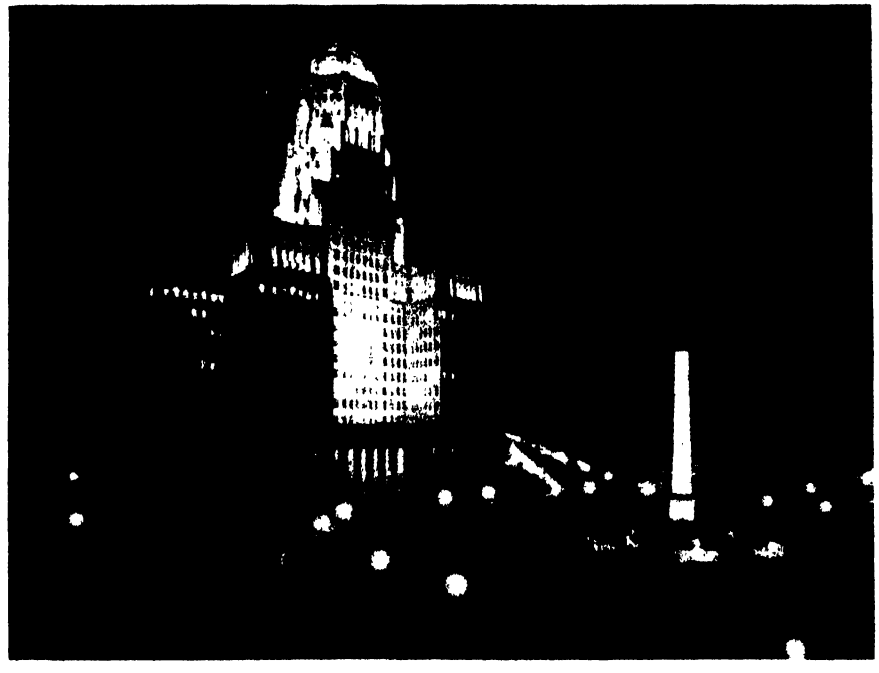
Students

Students of chemistry and chemical engineering are urged to attend the Buffalo meeting. By doing so, they will find many opportunities to improve themselves and to make valuable contacts with other students and prominent chemists from a wide territory. A broad field of subjects will be covered in the papers presented in the general and divisional meetings. The educational aspects will be "spiced" with complimentary entertainment.

The Student Committee in conjunction with the Division of Chemical Education is arranging a program of distinct interest to students. Experts will discuss the use of chemical literature, the importance of chemical fundamentals, what industry expects from its newly-hired employees, etc.

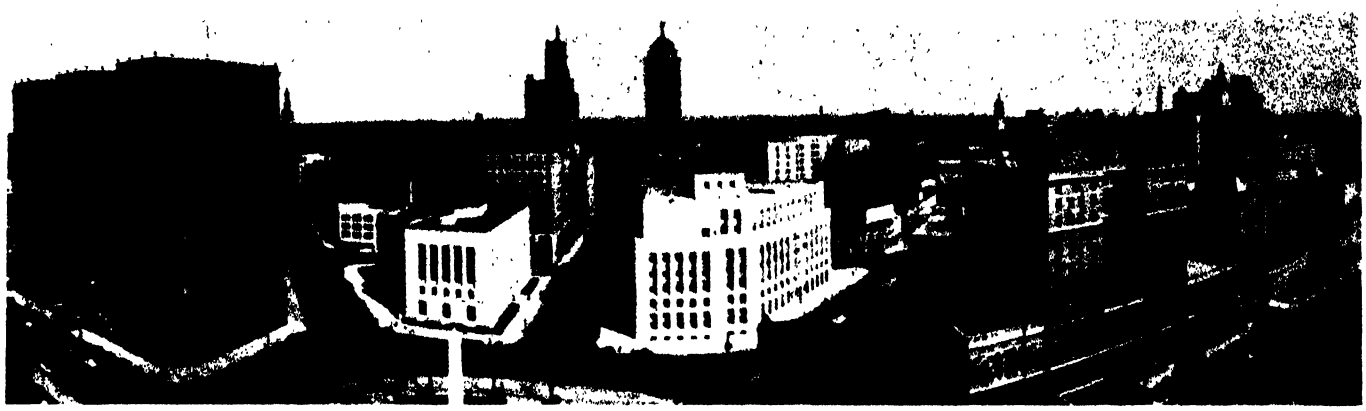
As usual, a low-cost breakfast for students will be held. Fraternal, academic, and professional groups will meet for various meals.

Student members and paid student affiliates of the AMERICAN CHEMICAL SOCIETY, registered at the meeting, are eligible to utilize the facilities of the A. C. S. Employment Clearing House (see 724).



The registration fee for a regularly matriculated student of chemistry or chemical engineering is $3.00. Special low-priced hotel accommodations will be available.

For further details of the students program, please address Groves H. Cartledge, Chemistry Department, University of Buffalo, Buffalo, N. Y.



Golf Tournament

The semiannual A. C. S. Golf Tournament will be held on Thursday afternoon, September 10, at the beautiful Niagara Falls Country Club. Many suitable prizes have been provided by the committee, the chairman of which is J. S. Reichert. As usual, the Wilson cup will be awarded to that *member* of the SOCIETY who has the lowest gross score.

Busses will leave the Hotel Statler at 11:30 A. M., arriving at the club one hour later. Luncheon will be served at the

City Hall at night

clubhouse. Participants will tee off at 1:30 P. M.

Tickets, to be sold at registration headquarters in the Hotel Statler, will include cost of transportation, luncheon, and greens fee.

Two Buffalo golf courses will be open during the meeting to all registrants. Further particulars will be available at registration headquarters.

Employment Clearing House

At Buffalo the SOCIETY again will provide facilities to bring together employers looking for chemists and chemical engineers and *members and paid student affiliates registered at the meeting*, seeking employment and wishing to make such contacts.

Beginning Sunday afternoon, candidates for employment will file records in the Clearing House on forms which provide space for a photograph, personal data, and information regarding education and experience. The records are maintained in classified files and also are indexed under all fields of training and experience. This enables an employer to find quickly the records of those with the qualifications desired.

Beginning Monday morning, appointments for interviews will be made at the request of employers and at the times they specify. Private booths will be assigned for such conferences No chemist or chemical engineer looking for employment and no employer looking for trained men can afford to miss this opportunity. Many personnel representatives attend each meeting solely to take advantage of the service.

Candidates for Employment

By action of the Board of Directors (December 12, 1940), the Employment Clearing House is open only to members and paid student affiliates of the AMERICAN CHEMICAL SOCIETY registered at the meeting.

Advance registration is helpful to the registrant and to the staff of the Employment Clearing House. Please request the necessary forms from the AMERICAN CHEMICAL SOCIETY, 1155 16th St., N. W., Washington, D. C. Forms will not be available to inquirers until July 1; requests received before that date will be filled as soon as possible. Forms can be completed under more favorable circumstances at home than in Buffalo. If returned by mail well in advance of the meeting, trained Clearing House personnel will suggest, when desirable, changes that will make the record more serviceable to employers. Advance registration also enables completion of much of the clerical work in Washington, thus relieving congestion at the meeting. Records filed in advance cannot be inspected by employers until after the arrival of the registrants, since all users are assured that everyone whose vita is on file is available for interview. Those who do not file vitae by mail may fill out the forms in the Clearing House after arrival.

Since employers begin inspecting these vitae on Monday, most effective use is made of the records of those who register Sunday and Monday. Experience shows that more interviews and offers of employment are received by those who register early.

Amplification of the data on the forms and lists of publications cannot be accepted for filing in the Clearing House. No part of the record is of more importance than a good photograph; many employers will not interview an individual who does not attach a picture. Each person should bring with him *two* copies of a *good* photograph, not larger than 2.5 × 3 inches.

Employers

By action of the Board of Directors (December 6, 1941), the Employment Clearing House is not open to any employer or employer's representative "who, in offers made as a result of interviews in the Clearing House, is unwilling to meet the recommendations unanimously adopted at the Atlantic City meeting of the AMERICAN CHEMICAL SOCIETY in its resolution on employer-employee relationships". [See NEWS EDITION 19, 1442 (December 25, 1941).]

Although employment of chemists and chemical engineers is at a high level owing to the demands of rapidly expanding industry, it is our expectation that employers will find in the Buffalo Clearing House registrants whose availability might not otherwise be known. They will be primarily individuals seeking a change of employment, especially chemists and chemical engineers in nonessential industries wishing to make new connections in order to contribute directly to the war program. Many employers expected a small Clearing House registration at recent meetings. Actually 421 were available for interview in Memphis, 324 in Atlantic City, and 527 in St. Louis. At Memphis, 1701 interviews were arranged.

Employers who have never visited an A. C. S. Employment Clearing House will find this unique employment aid of distinct value. Many personnel department representatives attend each meeting solely to take advantage of this service. The number of employers regularly using the A. C. S. Employment Clearing House at national meetings of the SOCIETY indicates that the activity is meeting a real need.

The forms filed by candidates for employment provide space for a photograph, personal data, and information regarding education and experience. A classified index will be maintained so that one can find quickly those with the special training or experience desired. A private room will be available in which employers' representatives may inspect the index and vitae at any time from Monday through Friday. At the request of the employer, interviews will be arranged promptly with any whose records are on file. The space available in Buffalo will permit erection of more private interview booths than heretofore.

We know of no other place at which one can find not only the records of such a diversified group of chemists and chemical engineers, but the individuals themselves. Any employer, having a vacancy to fill or anticipating one, can ill afford to pass up this opportunity to make personal contacts.

The advantages to employers are many. They may inspect these records without

Hotels and Housing Committee, Edward F. Wesp, Chairman

Buffalo Convention and Tourists Bureau
Genesee Building, Buffalo, N. Y.

Dear Sir: Please make hotel reservations noted below: _____, 1942

Hotel_____First choice

Hotel_____Second choice

Hotel_____Third choice

If the hotel of first choice is unable to accept the reservation, the Hotels Committee will endeavor to comply with your second or third choice in the order named.

_____Double rooms for_____persons, double bed ☐ twin beds ☐ Rate desired $_____ to $_____ per day

_____Single rooms Rate desired $_____ to $_____ per day

_____Suites - parlor and_____bedroom(s) for_____persons Rate desired $_____ to $_____ per day

Arriving September....., hour.....A. M.....P. M. Leaving September .....

Print names and addresses of all occupants including person making reservation:

NAME	STREET ADDRESS	CITY	STATE

If necessary attach sheet listing additional names.

Signature_____

any of the registrants knowing they are looking for chemists. Personal interviews are always more satisfactory than correspondence; this plan makes available to each employer individuals from widely scattered localities who otherwise could be interviewed only through time-consuming and costly travel.

Plan on using the A. C. S. Employment Clearing House on the Seventeenth Floor, Hotel Statler, Buffalo, N. Y., September 7 to 11, 1942.

Final Program

The final program will be printed in the August 25 issue of CHEMICAL AND ENGINEERING NEWS.

CHARLES L. PARSONS,
Secretary

Melchett Medal Awarded to A. C. Fieldner

THE Melchett Medal, awarded annually by the Institute of Fuel, of England, for outstanding achievement in work involving the scientific preparation or use of fuel, will be presented this year to Arno C. Fieldner, chief of the Technologic Branch and the Coal Division, Bureau of Mines, Department of the Interior. Dr. Fieldner is the second American so honored since the medal was first awarded in 1930. Previous recipients include Charles M. Schwab, Sir John Cadman, Fr. Bergius, and Etienne Audibert.

The medal is ordinarily presented personally to the recipient in London in October, but under present conditions arrangements may be made for the formal presentation in the United States.

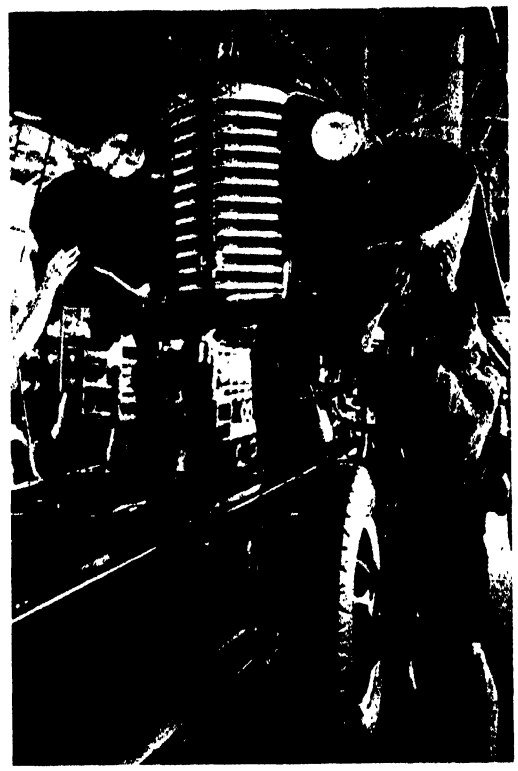
The President's Flag Day Proclamation

(Issued May 9, 1942)

"For many years it has been our American custom to set aside June 14 in honor of the flag, the emblem of our freedom, our strength, and our unity as an independent nation under God. Now we are fighting in the greatest cause the world has known. We are fighting to free the people of this earth from the most powerful, the most ruthless, the most savage enemy the world has ever seen. We are dedicating all that we have and all that we are to the combat. We will not stop this side of victory.

"We as a nation are not fighting alone. In this planetary war we are a part of a great whole: we are fighting shoulder to shoulder with the valiant peoples of the United Nations, the massed, angered forces of common humanity. Unless all triumph, all will fail.

"For these reasons it is fitting that on our traditional Flag Day we honor not only our own colors but also the flags of those who have, with us, signed the Declaration by United Nations, paying homage to those nations awaiting liberation from the tyranny we all oppose, to those whose lands have escaped the scars of battle, to those who have long been heroically fighting in the blaze and havoc of war.

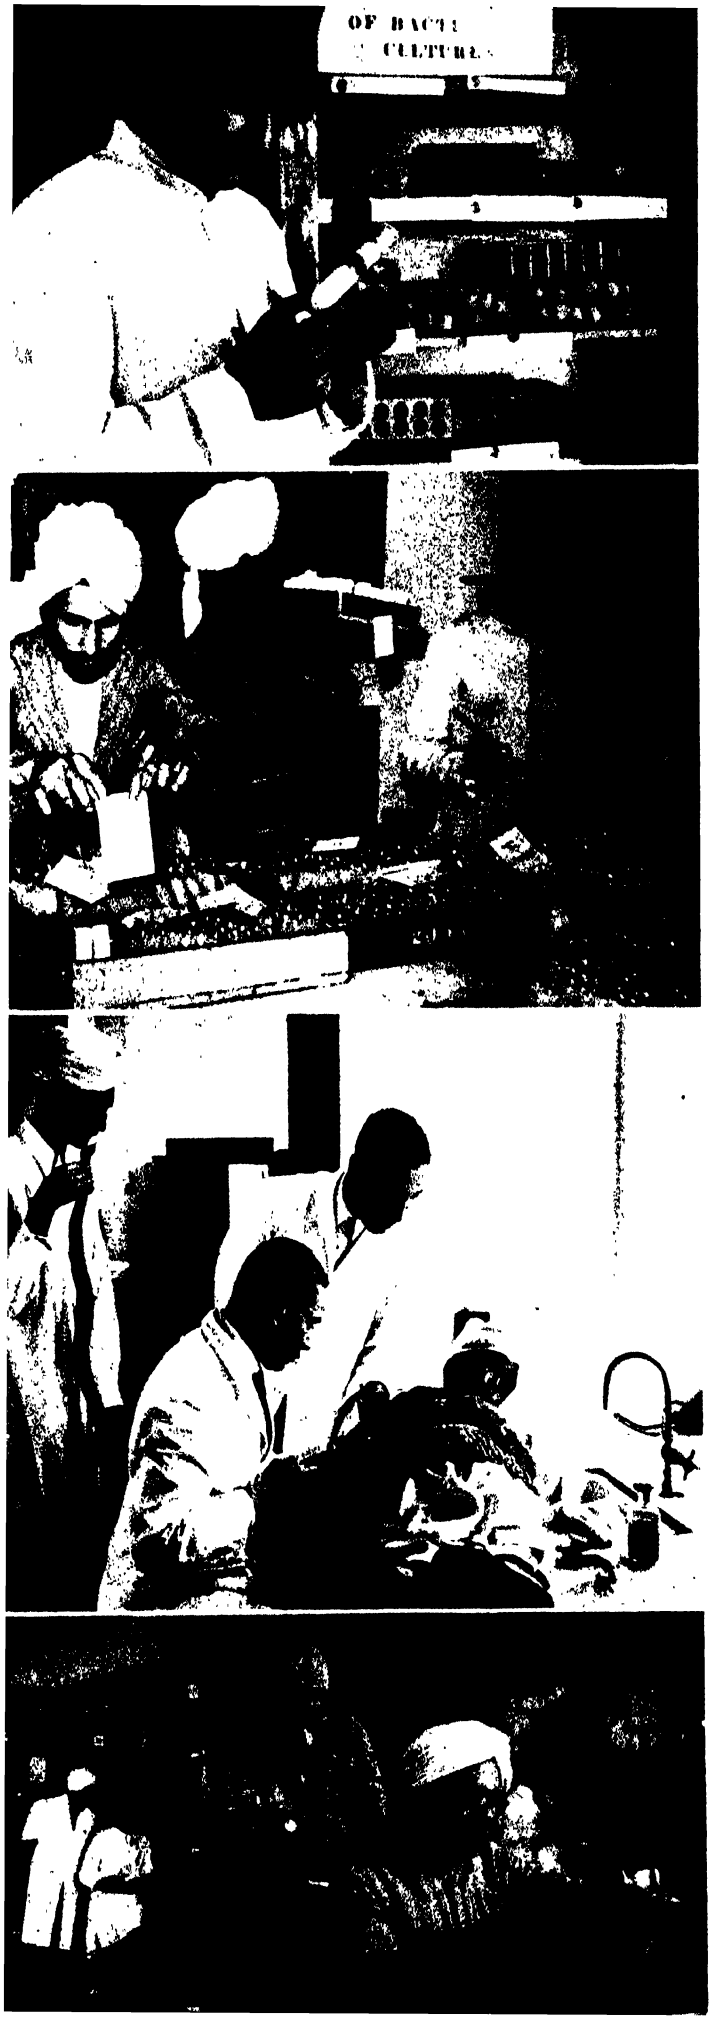


"It is also fitting in this time of stress that we express our devotion to our courageous mothers, many of whom are sending out their sons to do battle with the enemy and all of whom are so loyally contributing to the waging of the war on the home front.

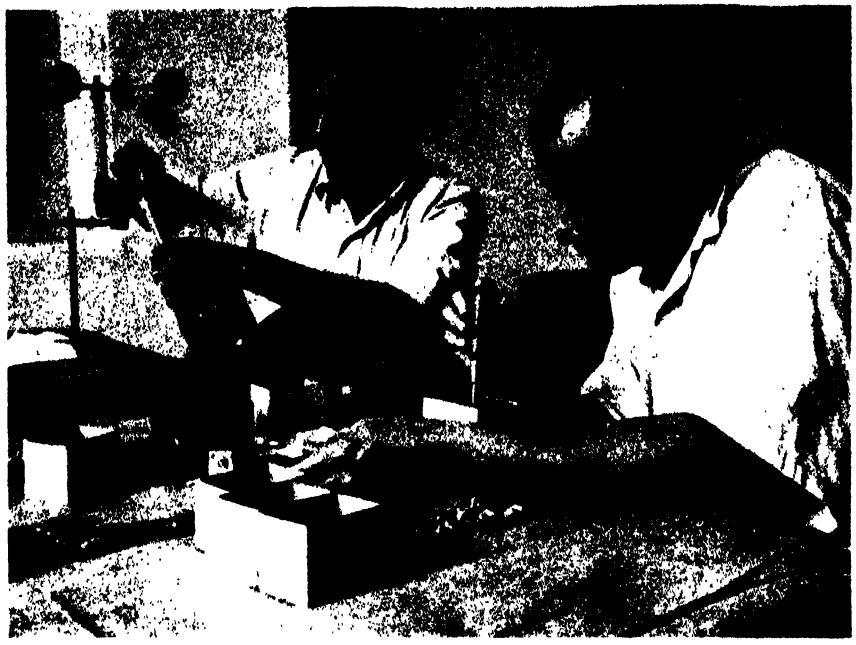
"Now, therefore, I, Franklin D. Roosevelt, President of the United States of America, do hereby ask that on Flag Day, June 14, 1942, the people of our Nation honor the peoples of the United Kingdom of Great Britain and Northern Ireland, the Union of Soviet Socialist Republics, China, Australia, Belgium, Canada, Costa Rica, Cuba, Czechoslovakia, the Dominican Republic, El Salvador, Greece, Guatemala, Haiti, Honduras, India, Luxembourg, the Netherlands, New Zealand, Nicaragua, Norway, Panama, Poland, the Union of South Africa, Yugoslavia—knowing that only in the strength and valor of our unswerving unity shall we find the force to bring freedom and peace to mankind.

"I direct the officials of the Federal Government, and I request the officials of the State and local governments to have our colors displayed on all Government buildings on Flag Day, and I urge the people of the United States to fly the American flag from their homes in honor of the Nation's mothers and their valiant sons in the service and to arrange, where feasible, for joint displays of the emblems of the freedom-loving nations on that day."

WARTIME



Industrial India



Fender, radiator, radiator grill, and headlight assembled unit being mounted on the chassis from an overhead conveyor at a General Motors plant in India

INDIA'S 350,000,000 persons are predominantly agricultural, deriving support from seasonal crops such as rice, tea, and coffee, or from the harvesting of timber, rubber, and other crops of the land. Now that the tide of war has practically severed this continent from certain and effective aid from England and the United States, India must look to herself for manufactured goods. Although 70 per cent of the people have been farmers and dependent upon exchange of materials between nations, war expediency has founded and expanded heavy manufacturing industries. Chemical industries are producing necessary materials never before made on that continent and new drug companies are not only processing, for domestic consumption, the drugs and herbs indigenous to India but successfully synthesizing modern pharmaceuticals. Heavy machine industries were already well founded before the war began and used to good advantage the traditional patience and skill of the native.

Progress of the newborn heavy chemical industry has been good. Plants to produce soda ash, synthetic ammo-

At India's Central Research Institute. *Top.* Taking stock of collection of living cultures. *Center above.* Cholera vaccine has been tested and passed for dispatch. *Center below.* Antivenin being injected into the vein of a child bitten by a Russell's viper. Child's father holds the dead snake. Where the identity of the type of snake is established, records show over 90 per cent recovery among those bitten. *Bottom.* C. R. I. library, open to all the medical workers in India, contains a highly specialized collection of books in many languages.

Anemometers, for registering wind velocity, are tested and repaired at Poona Institute. The Poona meteorological office administers seven main and 300 surface observatories.

nia, caustic soda, chlorine bleaching powder, and bichromates were all started when wartime transportation difficulties began to squeeze the country's imports.

Plants to manufacture stabilized bleaching powder, soda ash, heavy chemicals, and sulfuric acid were erected. Sulfuric acid is manufactured at various places. Only one establishment uses pyrites for sulfuric acid production. Investigations of the Geological Survey of India have revealed large deposits of high-grade rock sulfur.

Never a heavy importer of acetic acid, India now augments her supply by a small factory which turns out fairly large quantities annually from acetate of lime from a near-by source. A Bengal company is said to be producing other quantities of this acid. Other organic acids, such as tartaric, citric, and oxalic, are imported to a major degree, but it was reported before the outbreak of the Pacific war that a firm was beginning their manufacture.

Soda ash, chlorine, caustic soda, and bleaching powder are made in fairly large quantities.

Ammonium sulfate is produced to a limited extent as a by-product of coking operations. Synthetic ammonia is also made for nitric acid and explosives. Later this will be the base for creating a fertilizer industry.

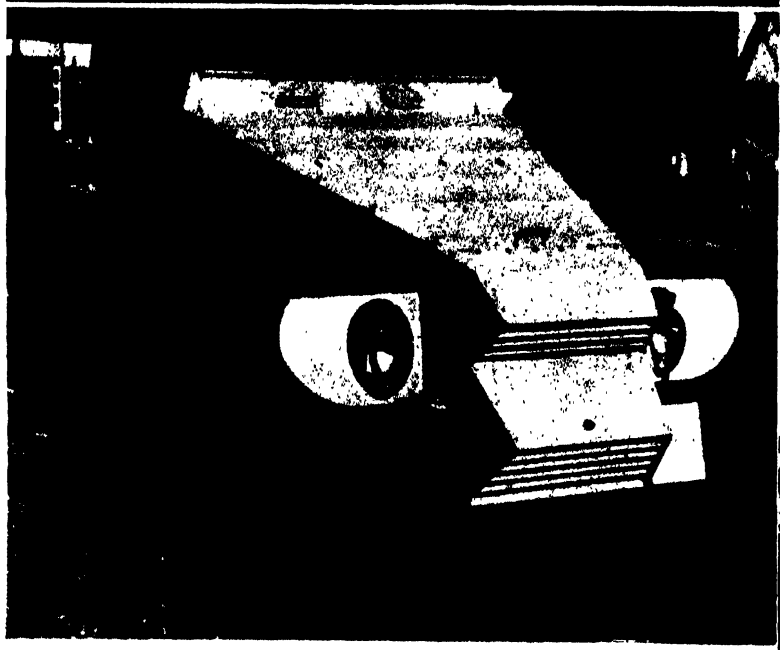
Demand for khaki-dyed cloth, plus India's large supply of chromite ores, have facilitated creation of a bichromate industry. The gap between demand and local supply has, heretofore, been filled by imports from the United Kingdom and the United States. Even with the contemplated expansion of all India's bichromate productive facilities to meet the present extraordinarily heavy demand, authorities in India say that a thorough overhaul of manufacturing processes and techniques will be necessary if the industry is to meet competition successfully and survive in a postwar world.

Methyl alcohol, acetone, and calcium have been produced by wood distillation as by-products of the manufacture of charcoal for iron and steel industries. Acetone is made in ordnance factories from acetate of lime.

Some of the most promising advances toward Indian independence have come in the field of drugs and pharmaceuticals. More than 290 drugs and many other items of medical supply formerly imported are being manufactured by home industries. The surgical instrument industry has been fully mobilized, and India is supplying 85 per cent of its own needs in this field.

Serums for treatment of tetanus, diphtheria, and anthrax are made. A cod liver oil substitute, oil from the livers of sharks caught in Indian waters, has entered large-scale manufacture. The government has purchased a large amount of this material.

The Central Research Institute is one of the most important factors in India's fight for health. It is known throughout the world for its research on the major epidemic and endemic diseases which ravage the native population.



Production of anticholera vaccine is calculated in millions of doses annually, and the institute is staffed for the production

At the Central Research Institute. *Top.* Colonel Webster, director of the Kasauli Pasteur Institute before the decentralization of antirabic treatment and now senior assistant director of the Central Research Institute in charge of the production of serum and vaccine. *Center.* Sealing ampoules with a blow pipe. All ampoules used by the C. R. I. are now manufactured in India. *Bottom.* Scrutinizing a rolled bottle of the cholera culture for vaccine.

of 200,000 doses a week. The C. R. I. also carries on the antirabic treatments, formerly under the guidance of the Kasauli Pasteur Institute, and is producing serum for the treatment of 20,000 cases of dog bite yearly.

A speciality is the production of snake bite antivenin, the venom being supplied by a sister institute. The C. R. I. manufactures a serum which is bivalent for the treatment of cobra or the Russell's viper bites. These two snakes are responsible for the largest number of deaths from snake bites throughout India.

Anesthetic ether output is 10,000 pounds a month, a new factory for galenicals is under construction, and dried blood plasma operations are being started. Emetine hydrochloride, required for treatment of amoebic dysentery, is obtained from ipecacuanha which grows wild in the forests of South America. It has been proved that it grows well in Mungpoo, Bengal, and cultivation is under way. Acriflavine, a disinfectant, is also made.

To prevent scurvy in soldiers, vitamin C is usually included in the diet of the army. India makes a concentrated vitamin C by drying amli berries, collected in Nilgris, and pressing them into tablets of suitable form. Amla berries are the most concentrated form of vitamin C that India has.

To utilize imported Tibetian borax, a small-scale plant for production of boric acid has been started.

Rubber goods, such as waterproof sheeting, hot-water bottles, and air cushions, are being made at various companies throughout the nation. The needs of the Medical Stores Department for rubber goods such as these has caused one firm to expand and erect two extra mills to meet the increased demand.

Government ordnance factories have been working at high pressure for some time. Before the war total employment in ordnance was 17,000. Today the number is over 50,000 and still rising. Plans under way call for a greater expansion amounting to 20 per cent and the provision of new plant and machinery which would enable the manufacture of the more modern types of armament including guns, car-

riages, and ammunition, aircraft bombs, light machine guns, and loose liners for the 3.7-inch antiaircraft guns.

Small arms ammunition is manufactured to R. A. F. specifications in India, and a plant for high explosives is being installed. To provide raw materials for explosives manufacture, facilities for production of benzene and toluene were greatly extended.

For the manufacture of high-grade steels, existing plants were expanded and modernized. Similar extensions are being carried out in ordnance factories producing guns, gun carriages, finished shells, fuses, and miscellaneous components. When complete, these expansions will enable India to produce, in addition to guns already being manufactured, certain field guns of the most modern type, to maintain the latest types of antiaircraft guns, and to supply these weapons with ammunition.

The Harlow, the first plane assembled in India, was designed in America

The Search for Unity[1]

RAYMOND B. FOSDICK

President, Rockefeller Foundation, New York, N. Y.

IF WE are to have a durable peace after the war, if out of the wreckage of the present a new kind of cooperative life is to be built on a global scale, the part that science and advancing knowledge will play must not be overlooked. For although wars and economic rivalries may for longer or shorter periods isolate nations and split them up into separate units, the process is never complete because the intellectual life of the world, as far as science and learning are concerned, is definitely internationalized, and whether we wish it or not an indelible pattern of unity has been woven into the society of mankind.

There is not an area of activity in which this cannot be illustrated. An American soldier wounded on a battlefield in the Far East owes his life to the Japanese scientist, Kitasato, who isolated the bacillus of tetanus. A Russian soldier saved by a blood transfusion is indebted to Landsteiner, an Austrian. A German soldier is shielded from typhoid fever with the help of a Russian, Metchnikoff. A Dutch marine in the East Indies is protected from malaria because of the experiments of an Italian, Grassi; while a British aviator in North Africa escapes death from surgical infection because a Frenchman, Pasteur, and a German, Koch, elaborated a new technique.

In peace as in war we are all of us the beneficiaries of contributions to knowledge made by every nation in the world. Our children are guarded from diphtheria by what a Japanese and a German did; they are protected from smallpox by an Englishman's work; they are saved from rabies because of a Frenchman; they are cured of pellagra through the researches of an Austrian. From birth to death they are surrounded by an invisible host—the spirits of men who never thought in terms of flags or boundary lines and who never served a lesser loyalty than the welfare of mankind. The best that every individual or group has produced anywhere in the world has always been available to serve the race of men, regardless of nation or color.

What is true of the medical sciences is true of the other sciences. Whether it is mathematics or chemistry, whether it is bridges or automobiles or a new device for making cotton cloth or a cyclotron for studying atomic structure, ideas cannot be hedged in behind geographical barriers. Thought cannot be nationalized. The fundamental unity of civilization is the unity of its intellectual life.

There is a real sense, therefore, in which the things that divide us are trivial as compared with the things that unite us. The foundations of a cooperative world have already been laid. It is not as if we were starting from the beginning. For at least three hundred years the process has been at work, until today the cornerstones of society are the common interests that relate to the welfare of all men everywhere.

In brief, the age of distinct human societies, indifferent to the fate of one another, has passed forever; and the great task that will confront us after the war is to develop for the community of nations new areas and techniques of cooperative action which will fit the facts of our twentieth century interdependence. We need rallying points of unity, centers around which men of differing cultures and faiths can combine, defined fields of need or goals of effort in which by pooling its brains and resources the human race can add to its own well-being. Only as we begin to build, brick by brick, in these areas of common interest where cooperation is possible and the results are of benefit to all, can we erect the ultimate structure of a united society.

A score of inviting areas for this kind of cooperation deserve exploration. Means must be found by which the potential abundance of the world can be translated into a more equitable standard of living. Minimum standards of food, clothing, and shelter should be established. The new science of nutrition, slowly coming to maturity, should be expanded on a world-wide scale. The science of agriculture needs development, not only in our own climate but particularly in the tropic and subtropic zones. With all their brilliant achievements the medical sciences are in their infancy. Public health stands at the threshold of new possibilities. Physics and chemistry have scarcely started their contributions to the happiness and comfort of human living. Economics and political science are only now beginning to tell us in more confident tones how to make this world a home to live in instead of a place to fight and freeze and starve in.

All these matters await the future peace. Nevertheless they constitute the stern realities of the present, for as Vice-President Wallace has said: "From the practical standpoint of putting first things first, at a time when there are not enough hours in a day and every minute counts, planning for the future peace must of necessity be a part of our all-out war program."

Herman Frasch—Chemical Engineer

Peculiarly fitting is some recognition this year of the 90th anniversary of the birth of Herman Frasch. Probably there is no chemist who does not know of the sulfur-mining method he invented and developed, which has established this country as the world's foremost producer of this most important chemical raw material. Our chemical industry would be in a sad plight today were it still dependent on Sicily for sulfur as it was previous to the work of Herman Frasch.

Yet another reason for reviewing the life of this great inventor is the current attack on the American patent system by many who do not seem to understand that the purpose of the patent system is to call forth and develop new processes and products enriching life and ensuring our independence. As a 24-year-old pharmacist in Philadelphia, Herman Frasch patented a process for refining paraffin wax. Sale of this process to the Cleveland Petroleum Co. was the beginning of his career as a chemical engineer. His native curiosity led him into many diverse fields where his ingenuity resulted in many inventions for which he obtained patents. With the income obtained in this way he was enabled some 15 years later to solve successfully the problem of mining Louisiana sulfur, a project which has probably never been surpassed in the history of American chemical engineering for its technical and financial uncertainties.

Herman Frasch came to America from Germany at the age of 16, having had a high school education as a pharmacist's apprentice. He spent several years with Professor Maisch at the Philadelphia College of Pharmacy and at the age of 22 established his own laboratory. Work with paraffin wax took him into the petroleum industry where he became affiliated with the Standard Oil Co. at Cleveland. While at Cleveland he made a number of important inventions, including the development of waxed paper and an improved oil lamp.

In 1885 Mr. Frasch went into business for himself, purchasing a small refinery in Ontario where he worked out the process known among petroleum chemists as the Frasch process for desulfurizing oils by agitating and distilling the oil with copper oxide. It was immensely successful in treating high-sulfur crude oils of Ohio and Ontario and resulted in salvaging millions of dollars worth of oil previously unusable. The process was used on a large scale in refineries from Bayonne, N. J., to Whiting, Ind., for over 25 years. Mr. Frasch sold his petroleum business in 1888, but his interest in oil refining and production still continued as is evidenced by the patents he took out in this field, among them one for acidizing oil wells in 1890. Not until recent years was the real value of this method of oil-well treating fully appreciated. Today many thousand barrels of oil are recovered by this method using hydrochloric acid. A more recent development is the use of corrosion inhibitors to retard the attack of the acid on the well casing and equipment.

Many other phases of the chemical scene in the latter part of the 19th century also interested Herman Frasch as shown by his patents on such widely diverse subjects as the manufacture of white lead from galena, ammonia soda process, mining and manufacture of salt, mining of gold and other metals, extraction of linseed oil, and improvements in thermal electric generators.

It was in 1890 that Mr. Frasch applied for his patents on the sulfur-mining process, which was to be his greatest work, and between that time and 1905 he applied for 10 patents on that process. It is not necessary to describe to chemists how the geological structures overlying the sulfur beds in Louisiana made it impossible to mine the sulfur by ordinary methods nor how the Frasch process obtained the sulfur by pumping down vast quantities of superheated water, melting the sulfur in the beds, and raising it with an air lift. Years of arduous work were required to develop the method. A single experiment required 20 boilers of 150 horsepower each to produce the amount of superheated water necessary at 335° F.

Not until 1903 was the success of the sulfur-mining process assured, and in that year Frasch's company produced 35,000 tons. Imports that year, mostly from Sicily, were 188,000 tons. By 1907 imports had dropped to 20,000 tons and exports reached 35,000 tons. In one test extending two months six wells produced 122,000 tons! Since that time the American sulfur industry has been in a position to control the world market by the use of the Frasch process.

For his inventions in oil refining and sulfur mining Frasch was presented with the Perkin medal in 1911, and his address given at that time can be found in *Industrial and Engineering Chemistry*, February 1912. His retirement was spent in France where he died in Paris on May 1, 1914. Although he was born abroad and died abroad, most of his life was spent in America. He never received any formal engineering training, and yet he undoubtedly ranks as one of America's greatest chemical engineers.

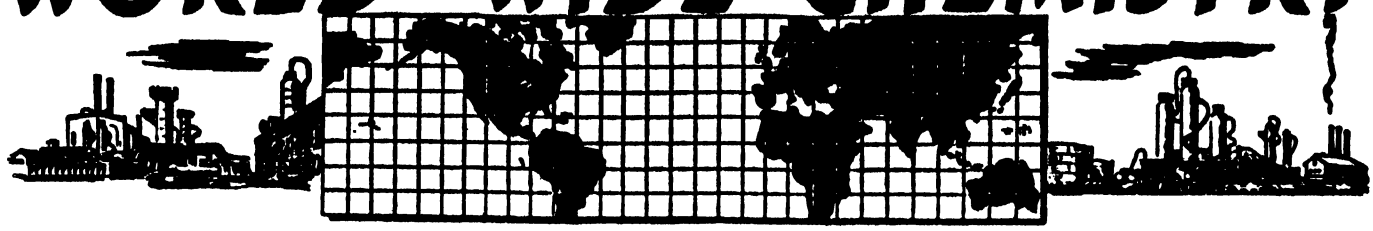
Western Reserve Schedules Two Defense Training Courses

Industrial electrochemistry and synthesis and use of strategic organic chemicals are two defense training courses in progress at Western Reserve University in the nation-wide effort to train men and women for scientific positions in the Government and war industries. Both courses started May 26 and require as a prerequisite one year of chemistry or its equivalent in practical experience. Information on defense training courses may be obtained from E. T. Downer, Cleveland College, Western Reserve University, Cleveland, Ohio.

Grants for Research in Nutrition

The Nutrition Foundation, Inc., has awarded 36 grants totaling $125,000 for independent research in the science of nutrition. Recipients included universities and research agencies throughout the United States and one in Canada, with awards ranging from $250 to $7,000. Each grant has been earmarked for a specific project, chosen from 81 applications by an advisory committee headed by Charles G. King.

Founder companies which contributed $50,000 each to make the scientific program possible are the American Can Co., Beech-Nut Packing Co., California Packing Co., Campbell Soup Co., Coca Cola Co., Continental Can Co., Corn Products Refining Co., General Food Corp., H. J. Heinz Co., Libby, McNeil and Libby, National Biscuit Co., National Dairy Products Corp., Owens-Illinois Glass Co., Quaker Oats Co., Standard Brands, Inc., Swift & Co., and United Fruit Co.



Research Fellowship

A new research fellowship in chemical engineering has been established at Vanderbilt University, Nashville, Tenn., by the Tennessee Products Corp. The work will pertain to development of products from wood distillation tars, under E. E. Litkenhous. William K. Lautner has been awarded the fellowship.

Who Makes It?

The National Registry of Rare Chemicals, Armour Research Foundation, Chicago, Ill., has had several requests for chemicals which have not been registered with it. It seeks sources for the following chemicals: oxy-cellulose compounds, 3-pyridine acetic acid, metanicotine, nornicotine, dioxyphenylalanine, bulbocapnine, very pure chlorophyll, and phosphorus tetrasulfamide.

WORLD-WIDE CHEMISTRY

Continental Europe

Germany

Annual reports of leading chemical companies for 1941 show effects of war on the industry. Chemische Produktenfabriken Pommerensdorf-Milch, Stettin, reports that the superphosphate plants operated temporarily and on a smaller scale, but manufacture of commercial fertilizers increased. Sales of chemicals remained on the 1940 level, and exports rose slightly. The company has taken a financial interest in a new factory in the Wartha district of Poland. Südchemie, Munich, reports that output of heavy chemicals was several times larger, a new factory was opened, and further extensions are under way or planned. Production of bleaching clay was used almost entirely in the home market, but some synthetic materials were sold in other continental countries. Output of superphosphates increased. Other company news from Germany is an increase in the capital of Sprengstoffwerke Oberschlesien G. m. b. H., explosives manufacturers in Upper Silesia, from 500,000 to 6,000,000 marks and the formation at Mannheim, Upper Rhine, of a 1,200,000-mark company, Ligrowa G. m. b. H., for vanillin manufacture.

Five Superpolyamides for Various Purposes Produced

Production of superpolyamides has progressed in Germany. Since various diamines and dicarbonic acids as well as condensation products of these and dialcohols can be used for the production of superpolyamides, many variations in the chemical structure are possible, I. G. Farbenindustrie at present offers five superpolyamides under the trade names Igamid A, B, 6A, 40B, and 85B. Igamid A is said to resemble nylon in properties. Other Igamid products differ mainly in their solidifying points, solubilities, and practical properties. Igamid A, B, and 6A have comparatively low molecular weights and form thin melts which cannot be processed by the methods usual with other plastics. Igamid 85B is recommended as possessing a sufficiently large thermoplastic range to permit processing in the usual way. The 6A compound is used for the manufacture of foils in thicknesses of 0.01 to 0.035 mm., which can be sewn. Igamid 40B has been developed especially for the lacquer industry. In their original states the superpolyamides are white to brownish, with a resemblance to ivory. When melted they can be stretched into thin threads superior to silk in resistance to tearing, elasticity, and water repellence. Threads and strips of superpolyamides can be stretched to four times their former length at normal temperatures, with the result of a considerable increase in tear resistance. Other advantages claimed for Igamid are high mechanical strength, fastness to light, nonflammability, and resistance to organic solvents. Igamid A and B can be pressed, molded, and sprayed, formed hot and cold, forged, and, with suitable precautions, welded like metals. They can be worked with knife and plane like ivory and horn. Igamid solutions are recommended as good adhesives. In combination with plasticizers they can be made into leatherlike substances. Their use is suggested for electrical insulation where good adhesion to metals and sneak current resistance are of advantage. Further Igamid products may be put on the German market.

Paper Fleece Impregnated with Synthetic Resin Replaces Leather

Shortage of hides and leather has stimulated output of artificial leathers. Combinations of synthetic resins and textile materials have often been found either too expensive or not strong enough to stand normal tear and wear. A substitute material, used on a scale equaling one tenth of the production of textile leather, is paper fleece of exceptional absorption power which is impregnated and covered with latex or synthetic resin. The paper character is said to be overcome entirely by the impregnation, and the material has a satisfactory mechanical strength. It was in production before the war and is now sold to manufacturers of leather bags especially. Output, though unrestricted, is limited by allocations of paper and synthetic resins.

Synthetic Fibers, PeCe and Perlon, Are Described

Details of PeCe and Perlon, the two fully synthetic fibers available to German manufacturers, show that the latter product is similar to nylon. When stretched after spinning to four times its length, it is superior to natural silk in elasticity and strength. Its specific weight is 1.1 as against 1.3 of wool and silk, and its melting point may be 270° C. It is used alone or mixed with other fibers.

PeCe fiber is described as containing 64 per cent of chlorine. It is resistant to nearly all acids and alkalies, bacteria, water, and fire and has a higher dielectric constant and better heat-insulation power than silk. Its strength in a wet state is equal to that in a dry state. PeCe fiber is used for filters, chemical protective clothing, fishing nets, and similar purposes. Its disadvantage is a low solidifying point of 80° to 90° C. which makes ironing of fabrics made from PeCe fiber impossible.

Polyvinyl Chloride Used to Protect Textile Fabrics

Polyvinyl chloride, marketed in Germany under the trade name Igelit, is not only used in foils on black sheets to save tin plate in the canning industry but also in paste form with suitable plasticizers in the protection of textile fabrics. Because of the high temperatures necessary for treatment of the textile fabric with Igelit, it cannot be used with woolen materials. It is employed for cotton and viscose rayon fabrics and has also found application on jute fabrics where its resistance to moisture and many chemicals is a particular advantage.

Improved Cellwood Type Said to Resemble Wool

A leading German cellwool manufacturer has begun commercial production of a new type which is said to resemble natural wool more closely. The new cellwool, produced by the viscose spinning process, differs from other types by the existence within the fiber of hollow spaces which give improved insulation value. The volume of the spun thread is

---

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

30 to 40 per cent larger than that of a corresponding quantity of viscose, and appearance and touch, it is claimed, are more wool-like than is usual with cellwool. Difficulties encountered in processing are said not to be important, but no practical experience about the new material is yet available. The shortage of natural wool and cotton is becoming acute in countries under German domination, and consequently interest is shown in the production of cellwool and similar materials. Even those without an adequate raw material basis, such as Denmark and Belgium, pursue plans for cellwool manufacture. Spain, France, Holland, Norway, Sweden, Slovakia, Hungary, and Rumania are all engaged in the erection of cellwool factories, most of which use German processes though some of the Spanish and Hungarian projects are supported by the Italian Snia Viscosa company.

New Process Developed for Wood Impregnation

A new process using highly volatile solvents has been developed to facilitate impregnation of indigenous timbers with synthetic resins, lignite ozokerite, or similar substances. The products are substituted for imported hardwoods. Impregnation is carried out in a closed vessel, and the solvent is extracted after impregnation by application of underpressure. Special advantages are that the wood need not be dry as the water is expelled by the solvent and that the treated timber does not swell, is very hard, especially vertical to the fiber.

Retort Carbon and Pitch-Coke for Carbon Electrodes

The big expansion of the aluminum and magnesium industry and other metallurgical developments have greatly increased demand for carbon electrodes in Germany. Among suitable domestic materials carbon precipitated on the walls of coke-oven and gas-furnace chambers is of considerable importance. It requires no further treatment and has a low ash content of 0.5 per cent, while volatile matter and sulfur are entirely absent. Great interest is also shown for pitch coke which is available in very large quantities. It may contain 0.7 per cent volatile matter, 0.9 per cent ash, and 0.7 per cent sulfur. The ash content may be reduced if the heavy oil fraction obtained by distillation is added to the coal-tar pitch before carbonization. Technical work in recent years has improved the quality of electrode coke and prevented premature deterioration of the furnaces used for the production of pitch coke, but various materials with suitable properties are now said to be offered in sufficient quantities so that availability of plant and costs of production seem to be the principal considerations for the choice of electrode material.

Denmark

Difficulties in fuel supply have resulted in increased burning of peat in rural districts. The peat ash remaining after burning is being used as a fertilizer. Systematic experiments in Denmark have shown that the contents of phosphoric and potassic material vary greatly so that exact dosage is impossible. The peat ash also contains lime and is regarded as a suitable fertilizer on soils lacking in this respect. Handling of the ash causes some difficulty.

Southeastern Europe

Since A. G. Dynamit-Nobel, leading chemical enterprise in Slovakia now under German control, almost doubled its capital in January, German interest in commercial exploitation of the small countries of southeastern Europe has been increasing. Reports are numerous of formation of new companies and extensions of existing plants, mostly under participation of German chemical firms.

In Pistyan, Slovakia, Facet A.-G. has been formed for the manufacture of chemical and pharmaceutical products from the famous mineral springs. The long-closed sulfuric acid and superphosphate factory at Kostolany, Slovakia, has been transferred by Dynamit-Nobel to a new company, East Slovakian Chemical Works, which is to resume operations.

In Agram, Croatia, Chemische Fabriken A.-G. was organized for the manufacture of copper sulfate, sulfuric acid, and superphosphates. The company will receive a monopoly for production of the first two chemicals provided the factories are built within the next two years. Several old mills in Croatia have been equipped with apparatus for extraction by a new method of maize kernel oil for use in the soap industry. An annual output of 500 tons is the goal.

In Rumania Acital Industrie A.-G. has been formed to manufacture various chemicals. German interests have negotiated with a Rumanian rubber manufacturer about erection of a plant to make 3,000 tons a year of synthetic rubber using natural gas. Natural gas is also said to be used as a raw material for formaldehyde in Rumania. A company organized before the end of last year will use it for iron smelting, where it replaces coke in a process developed in Germany.

In Sajetshar, Hungary, a new glue factory, which will also produce casein products, has been built. Hungarian farmers complain of shortages of certain fertilizers. While nitrate of lime seems plentiful and is even exported, other nitrogenous fertilizers are in short supply. The capacity of the plant at Pét is to be raised to 45,000 tons.

Operations of mines of the Galician potash industry were discontinued after the invasion of Poland in 1939. Since reported damage was heavy, it was not expected that great efforts would be made for repair. Germany has a large potash production and intended to send to southeastern Europe large quantities which otherwise would have been shipped abroad. Transportation difficulties made this impractical, and one of the Polish potash mines has now been reopened to meet demands in local and adjoining markets.

Germany has also concentrated in the warmer countries of southeastern Europe on cultivation of plants for chemical manufacture. Poppies for opium production and plants for output of vegetable oils have aroused interest.

France

Increased activity in the French chemical industry is reflected by a large number of capital increases and new incorporations. St. Gobain, the chemical combine which raised its capital from 300,000,000 to 450,300,000 francs last year, will now boost it to 675,470,000 francs. The combine's glass interests were extended by merger with Société des Verriers Mécaniques de Bourgogne and Société Nouvelle de la Soie de Verre Isover. In the Kuhlmann group Société Chimique de l'Industrie, a company formed last year, has expanded its capital from 2,000,000 to 28,000,000 francs. The Péchiney combine has formed a new subsidiary, Société de Recherches et d'Entreprises Industrielles et Chimiques. Other new companies of limited importance are Etablissements Paul Besnard (Montreuil-sous-Bois), Société Commerciale pour les Industries Chimiques (Courbevoie), Société de Fabrication de Coagulants (le Kremlin-Bicêtre), and Savonnerie Franco-Coloniale (Paris).

Production of Artificial Fibers Being Expanded

The shortage of wool, cotton, and other natural fibers has increased interest in the manufacture of synthetic fibers by several foreign processes. Société des Textiles Artificiels du Sud-East will place a loan for 150,000,000 francs for the extension of its artificial silk plant. Société France Rayonne, which recently acquired control of another rayon manufacturer, Société Industrielle de Moy, raises its capital from 200,000,000 to 400,000,000 francs. Zellwolle- und Kunstseidering G. m. b. H., an important German group in the rayon and cellwool industry, has acquired a 33 per cent interest in France Rayonne and put its technical knowledge at the disposal of the French company which intends to build a cellwool factory

in the unoccupied zone with a daily output of 10 tons. Later this plant is to be extended to a capacity of 21,000 tons a year. The company is experimenting with reed and broom as raw materials for cellwool manufacture in a pilot plant in the Département Isère. A cellulose factory is also being built.

Another cellwool company, Le Sanitol Français, has raised its capital from 20,000,000 to 30,000,000 francs. The production of nylon was started in France by Rhône-Poulenc in a plant near Lyons last year. No news has been received since except that the output is on a limited scale.

Synthetic Oil Production Calls for Large Investments

The French motor fuel position is so unsatisfactory that substantial tonnages of mineral oils have to be provided for the occupied zone by German army authorities. While it is hoped that the producer gas program will bring some relief, plans for expansion of the output of liquid substitute fuels are progressing. Société de Combustibles et Carburants Nationaux is building a plant at Mireplisset, Ande, where lignite and shale are to be treated. Société Française des Pétroles has raised its capital from 600,000,000 to 800,000,000 francs and has been authorized to increase it further to 1,000,000,000 francs. Société de Hydrocarbures de Saint-Denis has expanded its capital to 15,250,000 francs, is to increase it further to 30,000,000 francs, and has received an authorization to bring it to 50,000,000 francs. Not all the new funds put at the disposal of French oil companies will be used for the construction of synthetic oil plants. The shortage of coal makes it almost impossible to proceed with some of the projects developed earlier, but work on others which were to be based on lignite and residual petroleum will be continued, if necessary equipment can be obtained.

Government Supports Colonial Developments

Many French industrial companies which have been deprived of opportunities for their normal business have taken an interest in the commercial development of raw materials in the North African colonies. The government has announced that firms formed for the utilization of North African raw material resources can obtain credits and guarantees, and the government may also participate in colonial development by taking a financial interest in new companies. Meanwhile colonial producers complain of lack of transportation. Thus Phosphates de Gafsa has not been able to make use of overseas markets because shipping space was restricted. Ouasta-Mesloula, a company developing lead, zinc, and copper deposits in Algeria, has received a state subsidy, but also suffers from shortage of transportation and fuel. The limitation of shipping has caused some French vegetable oil mills to send their equipment to Africa. It is intended to increase vegetable oil exports from French West Africa from 12,000 to 45,000 tons yearly. Construction of a paper pulp plant and distilleries for the production of vegetable liquid fuels in North Africa has been proposed. These and similar developments are supported by companies which have sold continental interests to German firms and wish to invest the proceeds. The Mirabaud group which owned the Mines de Bor, Europe's largest copper mines, in Yugoslavia, has acquired a financial interest in the Syndicat Pétrolier Colonial. The group is also financing experimental work on the extraction of magnesium from sea water at Sète.

Copper Sulfate Allocations Reduced, to Be Stopped

While the search for new potash and sulfur deposits in southern France is likely to contribute to an increase in the supply of inorganic fertilizers, allocations of copper sulfate to vineyards have had to be reduced this year because of the copper shortage. During the first three months of 1942, 10,000 tons of copper were distributed among copper sulfate manufacturers, compared with 15,000 tons in the preceding year, and no further allocations will be possible. A substantial part of the French copper sulfate demand was covered by imports before the war, and these have stopped completely.

Soap Manufacture and Consumption Restricted

The shortage of vegetable oils has necessitated reductions in the maximum contents of fatty acids in soaps and soap powders. Toilet soaps must not contain more than 18 per cent of fatty and resinous acids, household soap not more than 26.5 per cent, and cleaning powders not more than 9 per cent. Fatty substances will be allocated for soap manufacture only to firms which possess adequate facilities for the recovery of glycerol. The glycerol lyes must be concentrated to at least 80 per cent glycerol contents. The soap ration for the general public has been fixed at 100 grams of household or 75 grams of toilet soap plus 75 grams of household soap or 250 grams of cleaning powders per month, but special allowances are made for certain classes of industrial workers, etc.

Italy

Production in the Italian chemical industry has been greatly impeded by the shortage of coal and electric power. This has been felt especially severely in the Po Valley where electrochemical industries depend upon power supply from hydroelectric stations in the Alps. These could not supply the usual amount of energy because of the low water level and late thaw, but the position has improved recently.

Aluminum Industry Undergoing Extension

Aluminium-Industrie A.-G., Chippis-Neuhausen, the Swiss aluminum holding company with important interests in Italy, reports that during the past year shipments of bauxite suffered from difficulties of transportation. Germany seems to have switched over mainly to French and Hungarian bauxites, which are situated more favorably, with the result that new outlets for Italian bauxite and alumina had to be developed at home. The company's alumina plant at Porto Marghera is undergoing extension. Societa Aluminie Veneto Anonima (SAVA) reports for 1941 that a new aluminum plant has been built with machinery and material received from Germany, and another is to be built this year. The company has substantial surpluses of alumina at its disposal. Some of this has been sent to Germany, but in the future it is to be used in the new aluminum plant. S. A. Laborazione Leghe Leggiere, the light metal manufacturing subsidiary of the SAVA, is also expanding.

Montecatini Combine Takes over Five More Companies

Montecatini, the Italian chemical combine which recently raised its capital to 2,000,000 lire, has taken over the assets and liabilities of Metallurgica Lombarda Piemontese (capital: 10,000,000 lire), Stabilimento Prodotti Chimici (3,000,000 lire), Soarchi Imbarchie Trasporti (2,500,000 lire), Industria Siciliana Acido Citrico (1,500,000 lire), and Industriale Lombarda (1,750,000 lire).

Raw Material Difficulties Met in Synthetic Fiber Industry

Italian production of artificial fibers increased last year, largely owing to progress in the works of Snia Viscosa. Exports of artificial silk declined, but those of cellwool were larger. The cellulose factory at Torviscosa, Province of Udine, which is using reed as a raw material worked normally, and good progress is reported for expansions under way. Thus the shortage of other cellulose materials was partly offset. The lanital (casein wool) production was on the whole maintained, though here also difficulties in the

supply of raw materials were encountered. Under an agreement with the Spanish Government Snia Viscosa is building a cellwool factory at Torrevalega in Spain. The Snia Viscosa process is also used by the Hungarian Viscose Co. which was to commence the production of cellwool in a new factory near Komorn on the Danube River in the spring of this year.

Substantial quantities of synthetic fibers are now used in the manufacture of tires. Societa Italiana Pirelli, the Italian rubber manufacturer who raised his capital from 300,000,000 to 400,000,000 lire and may increase it further to 500,000,000 lire, reported that recently three quarters of all rubber used and two thirds of all fibers were of synthetic origin.

Linoleum Made from Cellwool and Tomato Skins

Societa del Linoleum Anonima has commenced production of a new kind of linoleum from local raw materials. While the jute is replaced by cellwool, a gum resin said to be manufactured from tomato skin is used instead of linseed oil

Italian Company Sets Record Mercury Output

Stabilimento Minerario di Sieli, the second largest mercury producer in Italy, is reported to have reached an output of about 40,000 flasks, equal to 1,500 short tons, in 1941. This is the highest figure on record in the history of the company and exceeds half the total Italian mercury production as reported for the last year before the war. The larger part of the Italian output is sent to Germany, mainly for the manufacture of explosives.

Efforts for Larger Motor Fuel Production Continue

A large number of increases in the capitalization of small, private enterprises in the Italian motor fuel industry reflects the wish of independent firms to profit from the liberal subsidies granted by the government for increased production of liquid fuels, but the output from private quarters has been so disappointing that the authorities have had to take further measures to stimulate oil production from domestic materials. Asphalt deposits in central Italy and Sicily have received much attention more recently. Semi-official companies have been entrusted with oil production from asphalt in central Italy, and in Sicily the ABCD company will in future deliver its whole output to AGIP, another company financed by the state, and receive a subsidy of 100 lire per quintal. It is hoped that up to 25 per cent of all busses in Sicily will be run on asphalt-Diesel oil mixtures eventually.

AGIP Supports Oil Production in Albania

AGIP, the central organization in the Italian oil industry, has lately concentrated on intensification of crude oil production in Albania. Although crude oil from that source cannot be treated by ordinary raffination and is subjected to hydrogenation, the production is to be extended. AGIP has supported research into possible deposits in Epirus, the Greek province adjoining Albania, and other parts of Italian-occupied Greece by AIPA, the Italian petroleum company operating in the Balkan peninsula. In the report for 1941 AGIP argues in favor of a continuation of the autarchy policy after the war. With that purpose in view the company has formed Azienda Lavorazione Bitumi Asfalti, a 50,000,000 lire subsidiary for development of asphalt deposits in central Italy.

Accounts for 1941 show that gross profits of AGIP declined from 105,000,000 to 55,000,000 lire. The net profit dropped from 24,300,000 to 10,600,000 lire, and the dividend, 5 per cent for 1940, was passed.

Montecatini Reports Big Expansion during Past Year

Accounts of Montecatini for 1941 show a rise in gross profits from 342,100,000 to 409,030,000 lire and in net profits from 160,840,000 to 195,720,000 lire of which 10 per cent dividend on the increased capital required 160,000,000 lire. No production figures are given, but consumption of electric power increased by 15 per cent to 2,140,000 kw.-hr., accounting for 10 per cent of the total Italian electric power output. The number of plants, mines, and factories owned and operated by Montecatini increased last year to 225 of which 30 were mines (pyrites, sulfur, copper, zinc, lead, bauxite, lignite, fluorite, barites, marble) while about two dozen others are engaged in utilization of these products. Increase in the number of factories seems to be mainly due to the policy of dispersal for fertilizer factories. No less than 58 plants, mostly small, are owned by Montecatini for the manufacture of phosphatic manure.

There are also eight factories for nitrogenous compounds which cover the whole agricultural and explosives demand, although the big 20,000-ton plant is not operating at present because of shortage of coal. The cyanamide and coke plants, the latter owned by Cokitalia, worked normal. The eight copper sulfate factories were obviously greatly impeded by shortage of copper. Montecatini experimented with insecticides containing citric and tartaric acid with 8 per cent of copper and believes to be near to the manufacture of a copper-free insecticide for vineyards. Twenty-five plants made industrial chemicals. They were affected to different degrees by the price stop orders, generally changed over to essential manufactures, and profited from an improvement in the export trade. No details are published about 18 factories making paints, lacquers, and explosives. The aniline dyes factory, in which I. G. Farbenindustrie holds a 49 per cent interest, increased sales, but only in cheaper grades. Two pharmaceutical factories started some new productions and placed small quantities in the export market. The manufacture of cosmetics was extended by some new types. Montecatini also operates one rayon, three plastics, and eight glue plants. Rhodiaceta Italiana, a Montecatini subsidiary, increased the output of cellwool, cellulose acetate, and plastics. It is reported that two nylon factories were completed and began operations, although machinery ordered from the United States was not received.

Considerable attention has been given to the metal plants. An alumina works was extended, a new aluminum factory is under construction, a new plant for synthetic cryolite was opened. The production of pyrites was raised to leave small tonnages for exports. Good progress is reported for the production of fine zinc and alloys, and output of cobalt and manganese ore is to begin shortly.

The amount of gasoline for passenger cars, rationed since March 30, was first 10 and is now 15 liters a week with larger allotments for doctors, veterinarians, taxis, and trucks. Industrial uses are also rationed. To relieve the shortage the Cía. Sudamerican de Vapores, the largest Chilean shipping company, has rented for four months the Argentine tanker *Los Pozos*, which will ship gasoline from the Peruvian oil port of Talara to Chilean ports.

Government to Establish Two Cement Plants in Chile

Cement is very scarce. The one Chilean factory, Soc. Fábrica de Cemento el Melon, at La Calera, Province of Aconcagua, cannot produce half of the country's needs. In the past year continous imports have been made from Canada and Argentina, with those from the latter entering free of duty. The government recently bought two complete cement plants, it is said, one in New Jersey and one in Pennsylvania, and is transferring them to Chile. These new factories will probably be operated by contractors under auspices of the Corporación de Fomento y de la Producción, underdepartment of the Minsterio de Fomento.

Government May Develop Bituminous Slate Deposits

Possible development by the government of the rich bituminous slate deposits near Lonquimay, Province of Cautín, is again rumored. Analyses made in England and Germany some years ago showed 16 per cent crude oil to the ton of slate. Attempts to exploit the deposits have been made since 1907 but all were stranded by difficulties of finding the necessary funds, about 150,000,000 Chilean dollars. The same financing problem is as yet unsolved.

Chilean Navy Cooperates in Exportation of Nitrates

The Chilean Navy is again serving the chemical industry by shipping nitrates to Brazil. In this way it is combining the instruction of cadets and commercial activity.

During February exports of crude nitrates were 838,030 quintals (1 quintal = 100 pounds).

Government Grants Funds for Development of Natural Resources

The Corporación de Fomento has made the following grants in Chilean dollars:

1,500,000 to a company to be formed for exploiting deposits of manganese in the Province of Antofagasta.

600,000 for exploring and exploiting zinc deposits in the Department of Illapel, Province of Coquimbo.

200,000 to the Soc. Minera Victoria de Quillagua for helping it develop the borax deposits de Quillagua and Punta Negra, Province of Tarapacá. The company will export the bulk of its products—borates and boric acid.

For continuing exploration of oil in Magallanes the government gave 602,-897.50 more Chilean dollars.

Gold and Copper Prices Are Headed for Increases

The contract between the Caja de Credito Minero and the Metal Reserve Company ends August 1. The prices will then be revised and probably increased for gold, refined and concentrate, and copper, refined and concentrate, as well as for other metals not yet mentioned.

Shortage of Acetone Forcing Argentine Cellulose Plant to Close

The most important cellulose factory of Argentina, near Buenos Aires, will be forced to close down very soon because of lack of acetone. This factory employs some 3,000 workers.

Despite Promise of Brazilian Aid, Rubber Supply Tightens

Although tires are not rationed, the supply is tight. A new tire factory, being built near Santiago by two United States citizens, will probably not be finished, it has been rumored. Production of rubber tacks and shoes is prohibited, and the small lots still coming from Ecuador, Peru, and Brazil are being used for pharmaceutical articles and vulcanizing. In February the Government of Brazil promised Chile 50 tons monthly of crude rubber, but until now nothing of this size has been shipped.

Construction of Tire Plant Using Native Rubber Considered in Peru

The Ministerio de Obras Públicas is considering construction of a tire factory because of the extreme shortage of tires. Peruvian rubber, which is no product of plantations but grows in a wild state in the provinces of eastern Peru, could be used.

SANTIAGO
May 9, 1942

Sales of Fertilizer in 1941 in Canada Decline

CANADIAN sales of fertilizer materials dropped from 85,600 short tons in 1940 to 74,500 in 1941, according to a special survey by the Dominion's Bureau of Statistics. Sales of mixed fertilizers amounted to 249,700 short tons for the year ended June 30, 1941, compared to 261,100 tons in the same period of 1940.

Canada's production of fertilizers was valued at $15,103,800 in 1940, a 14.7 per cent increase over 1939. The industry also produced 229,800 tons of cyanamide, ammonium sulfate, mixed fertilizers, and fish fertilizers in 1940 valued at $4,914,-700 from establishments classified as to other production as well.

Sodium Carbonate Imports by Brazil Continue Steady

IMPORTS of sodium carbonates by Brazil, largely from the United States and Great Britain, have remained steady for the past five years and are used in appreciable quantities by Brazilian industry, according to official sources. Brazil's glass, soap, textile industries, and tanneries are principal consumers and are centered largely in the areas around São Paulo and Rio de Janeiro. Other centers are situated in Porto Alegre, Pernambuco, Bahia, and Para. Some expansion of these industries is noted for recent years, with the prospect of increased output, especially of glass and soap, in 1942.

Turkish Chemical Industries Expand to Replace Imports

IMPROVEMENT was noted for the end of the year in a tendency on the part of Turkish buyers during most of 1941 to fill their chemical needs on a hand-to-mouth basis, which left very short supplies in some lines. Local industry also, even those branches dependent to some extent on imported chemical raw materials, showed increasing activity. Semigovernmental textile plants especially expanded output to meet the sharp drop in imports.

Prices generally remained high, with maximum profits on chemicals regulated by the government at 25 per cent. There is a 25 per cent levy on the landed cost of goods, so that importers' profits are directly proportional to such landed cost. Few importers feel in a position to quote fixed prices on merchandise because of fluctuating price conditions, shipping delays, etc.

Until late in 1941 Germany continued as a minor source of Turkish chemical imports, with Great Britain as the principal supplier. The year's end, however, saw German shipments in quantity of heavy chemicals and pharmaceutical specialties.

United Kingdom Depends on Home Glue, Gelatin Industry

WAR conditions have thrown almost the entire burden of home supply for glues and gelatins in the United Kingdom on the home industry, which formerly was an important factor in the export trade in these articles. Unable to obtain supplies from Axis-controlled sources and with a mounting demand at home, the industry no longer is in a position to meet demands for its products in the export markets. The government now licenses such shipments and has restricted them to those required for war manufacture in overseas countries.

Nevertheless, British glue manufacturers were able to maintain substantial export levels during the past year, though not at prewar figures. Allocations for 1942 are expected to be considerably reduced. A Glue and Gelatine Export Group has been functioning in the industry for the past year as an advisory aid to the government in the interest of both government and export trade.

Panama's Alcohol Output in 1941 Is 1,008,000 Liters

PRODUCTION of rectified alcohol in Panama in 1941 averaged 84,000 liters per month, a total of 1,008,000 liters for the year. Total production of pure alcohol required for manufacturers of alcoholic beverages amounted to 780,000 liters. Expanded industrial activity in Panama, it is said, has led to increased demand for chemicals generally.

Guatemalan Chemical Firm to Expand Sales

A PROGRAM for expanded output and sales to near-by countries by a Guatemalan firm which has been manufacturing chemicals on a small scale for the past 40 years has been reported. This company produces monthly 8,000 to 10,000 pounds of sulfuric acid, 1,200 pounds of hydrochloric acid, and 200 to 300 pounds of nitric acid. The first could possibly be increased, and the second is insufficient to meet demand. Nitric acid consumption is limited, and the factory's capacity is greater than demand or present output.

Manufacture of sodium sulfate exceeds consumption, permitting possible exports to neighboring export markets. Output of iron sulfate and silver nitrate meets the limited demand. Copper sulfate consumption amounts to 10,000 tons annually and is produced on a small scale only. Aluminum sulfate production is used for purifying drinking water to the extent of about 400 tons per year and is not produced by the company, which is investigating possibilities. The firm also is looking into manufacture of chlorine, potassium dichromate, acetic acid, and citric acid.

British Imports of Casein from Argentina Satisfactory

BRITISH imports of casein from Argentina are proving very satisfactory, according to the British casein plastics industry. The British industry at the beginning of the current year found itself with higher stocks than in 1941, and shipments from the Argentine were coming over with relatively minor losses from German submarine attack. In the past 12 months such losses were stated to be only 10 per cent of total casein shipments.

"As to the future", British trade sources report, "an additional demand for casein plastics is anticipated for the supply of buttons for utility clothing, and quantities running into many tons will be required in the next year. We are confident that we shall be able to meet this additional demand when it arises. The need for a material that will stand up to the government decontamination test has arisen and it has been found that the casein button modified by surface treatment will stand this test."

Eire Produces Industrial Alcohols from Potatoes

A DAILY output of about 1,000 gallons of industrial alcohol is reported for the four factories operating in Eire under the Irish Alcohol Factories, Ltd. This production is blended with gasoline. The alcohol is produced from potatoes, and the original capacity of 7,000 tons has been increased to 8,000. A fifth factory is not yet in operation.

Three Chemical Plants Are Opened in Ireland

THREE chemical manufacturing plants are operating in Ireland, manufacturing carbon dioxide gas, calcium carbide, and industrial alcohol. A special plant for producing industrial gases has been built by Guinness's Brewery at Dublin for utilizing waste carbon dioxide gas which arises from the fermenting vats. Production is scheduled to start in March, with a 200-ton annual output anticipated. This is expected to be enough to supply all creameries with essentials for refrigeration.

A small plant for producing carbide was established in County Limerick. Consumption of carbide in Ireland amounts to about 700 tons annually and this plant produced in February at the rate of 208 tons yearly, but increased output is expected. The Industrial Alcohol Factory at Cardonagh was reopened in January. The maximum output is 1,000 gallons of alcohol daily.

Improvements of Turkish Chemical Industry Reported

ALTHOUGH development has been slow on projected expansion of Turkish chemical production, improvements in that country's chemical manufactures are reported to the United States.

The Karabuk Iron and Steel plant increased by-product output, all of which was absorbed by the market, including 20 tons of toluene, 120 of benzene, 20 of naphthalene, 16 of road tar, and intermittent production, geared to market requirements, of ammonium sulfate. The plant is said to have considerable stocks of sulfuric acid. All the toluene production was utilized by the government.

Construction of a sodium hydroxide and chlorine plant is expected this spring, but failure of Germany to deliver certain small equipment items has held up completion of sulfuric and superphosphate plant construction. A cellulose plant is reported to be nearing completion.

Insecticides Needed in Canada for Rice and Spider Weevils

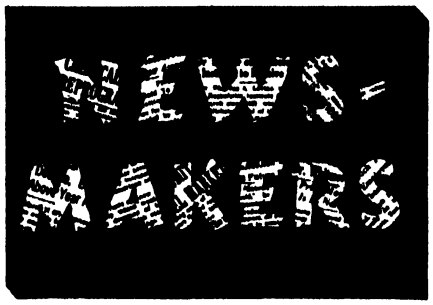
DEMAND for insecticides and fumigants to deal with two types of destructive pests in western Canada's temporary storage annexes is reported. The insects are said to be new to Canada. The rice weevil has been found in a temporary elevator in Manitoba and the spider weevil in a number of storage annexes in the Prairie Province.

THE United States with Argentina supplied stearic and naphthenic acid to Ecuador in 1941 for that country's candle and soap manufactures. Ecuador itself produces neither of these requirements.

Stocks of Nux Vomica in South India Decrease

SMALL crops and active demand on both coasts of southern India have resulted in dwindling stocks of nux vomica amounting to 500 or 600 long tons, a consular report states. Larger supplies are reported in other districts, among them Calcutta with about 1,200 tons, of which 40 are ready for immediate export. The United States, the largest buyer, however, purchases more from South India than from the Calcutta area. American purchases of nux vomica from India amounted to 679.50 long tons in 1940, compared with 461.75 in 1939. Great Britain is the second largest buyer, but in declining quantities in the two years, 328.15 long tons in 1939 and 146.10 in 1940.

Total shipments from India are also said to have declined, probably because of the war and shipping conditions, as this product has not been given priority in shipping. An increase of around 500 per cent has occurred in price quotations caused partly by withdrawal of Indo-China as a producing area, the increase being quoted on the South India product. Some holders in that section are reported waiting for even larger price rises before releasing stocks. This situation is said not to prevail in the Calcutta area, where loss of the Japanese market is felt.



Coal-Tar Coloring Imports into Mexico Are Increased

COAL-TAR coloring showed the largest increase of any chemical imports into Mexico in the first 10 months of 1941, according to an official report. The principal industrial chemicals imported by Mexico during that period were sodium hydroxide, sodium and potassium carbonate, and coal-tar coloring, which were nearly two and half times the earlier intake reported, 1,004 metric tons compared with 417.

Output, Stock Fill Turkish Ammonium Sulfate Needs

TURKEY met the domestic demand for ammonium sulfate during most of 1941 from small carry-over stocks and its production from the Karabuk plant. It was necessary to import some 3,000 tons during the last quarter of 1941, however, imports of 3,700 tons of superphosphate representing about the usual consumption.

TURKISH sulfur production amounts to about 4,000 tons annually, compared with yearly requirements for the country's vineyards of 6,000 to 7,000 tons. The balance is normally obtained from imports, but in 1941 incoming supplies, principally from Palestine, were negligible.

Harold L. Aldrich has been released by the United Carbon & Pigment Co., Newark, N. J., because he has been commissioned a lieutenant in the Navy. He is at present working in the Design Division, Bureau of Ships, Washington, D. C.

William J. Austin, formerly manager of the Chicago, Ill., office of the Explosives Department, Hercules Powder Co., has been appointed director of purchases of the company. He succeeds **Kurt W. Jappe,** who will become manager of detonator operations, Explosives Department, and is succeeded by **Frank W. Roman.**

John G. Beach, formerly raw material chemist and formulator with the Acme White Lead and Color Co., is now research engineer with the Battelle Memorial Institute, Columbus, Ohio.

Bernard Beck has joined the research staff of Lawrence Richard Bruce, Inc., Stamford, Conn., where he will work on synthetic organic chemistry research.

J. R. Brenemen

J. R. Brenemen has been appointed West Coast representative of the Gelatin Products Co., with headquarters in Los Angeles, Calif.

N. H. Brodell has been appointed metallurgical sales engineer for the Copperweld Steel Co., Warren, Ohio. He was formerly connected with the Timken Steel and Tube Division, Pittsburgh Crucible Steel Corp., and United Alloy Corp.

N. H. Brodell

James B. Conant, president of Harvard University, and **Marston T. Bogert,** Columbia University, have been asked to accept honorary membership in the Society of Chemical Industry.

William V. Cruess, University of California, has been awarded the Nicholas Appert Medal by the Chicago Section of the Institute of Food Technologists for outstanding contributions to food technology. Presentation will be made during the annual meeting of the institute in Minneapolis, June 15 to 17.

Charles Galton Darwin, director of the National Physical Laboratory since 1938, has been made scientific adviser to the British Army Council.

F. B. Davis

F. B. Davis, previously connected with the Edgar T. Ward Co., has been appointed by the Copperweld Steel Co. to manage sales of Aristoloy alloy steels and Coppco tool steels in the Buffalo district.

George E. Diamond has been appointed comptroller and **L. C. Vankirk** has been promoted to auditor of the Jessop Steel Co., Washington, Penna.

Robert L. Driver is now a first lieutenant, Foods and Nutrition, Sanitary Corps of the Army's Medical Department.

Graham Edgar, director of research of Ethyl Corp., will deliver the 17th Edgar Marburg Lecture June 24 at the annual meeting of the American Society for Testing Materials, Chalfonte-Haddon Hall, Atlantic City, N. J. Dr. Edgar's subject is "Gasoline—Past, Present, and Future".

After 24 busy useful years presiding over the library of The Chemists' Club, New York, **Miss Emily J. Fell** is retiring as librarian. At the annual meeting the membership voted commendation and good wishes to Miss Fell.

Thomas J. Finnegan, formerly with the Research and Development Department, Consolidated Edison Co. of N. Y., is now engaged in chemical engineering work for the operating companies of the Niagara-Hudson system with headquarters in Buffalo, N. Y.

At the commencement exercises of the New Jersey College of Pharmacy of Rutgers University on May 6 the honorary degree of doctor of science was conferred upon **Robert P. Fischelis,** secretary and chief chemist of the Board of Pharmacy of the State of New Jersey, for his notable contributions to the science of pharmacy.

H. P. Godard has been transferred as Inspecting Officer of Explosives for the Inspection Board of the United Kingdom and Canada from the Welland Chemical Works, Niagara Falls, Ontario, to the Cherrier, Quebec, plant of Canadian Car Munitions, Ltd. Both plants are operated for the Department of Munitions and Supply of Canada.

T. S. Grasselli has resigned as vice president and member of the board of directors of E. I. du Pont de Nemours & Co., Inc., because of ill health. Mr. Grasselli entered the employ of the Grasselli Chemical Co. in 1893, following graduation from Mount Mary's College, and served in all departments until 1916 when he was elected president. After the merger with du Pont he became a director, continuing as president of Grasselli. He retired from active work on November 14, 1939.

Albert B. Green has been granted leave of absence by the Dallas Laboratories, to serve as general manager for the Dallawax Corp., Kilgore, Tex., which will manufacture high melting point waxes developed by the Dallas Laboratories.

Edward J. Hackney has left the graduate school of Duke University to take a position as junior chemist in the Research and Development Division of the Tennessee Valley Authority, Wilson Dam, Ala.

F. R. Holden

Francis R. Holden has been appointed industrial hygienist on the staff of the Industrial Hygiene Foundation, Mellon Institute, Pittsburgh, Penna. For the past year and a half he has been on the natural gas fellowship at the institute.

A. M. Holmes has left the position of assistant chief chemist with Parke, Davis & Co., Detroit, to become assistant to the president of The Wm. S. Merrell Co., Cincinnati.

Walter Jebens, formerly connected with the Technical Division of the Du Pont Rayon Co., Buffalo, N. Y., is now with the Vinylite Research and Development Group of the Bakelite Corp., Plainfield, N. J.

Charles D. Karlsruher has left the Alcohol Tax Unit of the Treasury Department to accept a position as junior engineer in the Airport Design Section of the U. S. Office of Engineers, Albuquerque District, N. Mex.

Victor Lewitus has joined Merck & Co., Inc., New York, N. Y., as a writer in the Advertising Department.

Victor E. Marx has joined the staff of the American Dry Milk Institute, Inc., Chicago, Ill., where he will coordinate laboratory work, research work, and field service into one unit for the benefit of the baking industry.

William C. McIndoe is on military leave of absence from his civilian position of chemical engineer, Market Development Section, Bonneville Power Administration, U. S. Department of the Interior, and is in active service in the Army as a major of field artillery.

Henry E. Melvin, salesman for the J. T. Baker Chemical Co., working for the past year out of the Chicago office, has transferred from the field to the plant at Phillipsburg, N. J., where he will work on engineering problems in connection with the war effort.

R. W. Miller, who has been connected with the Pittsburgh Plate Glass Co. for 12 years, has been appointed manager of the technical service department of the Columbia Chemical Division, Pittsburgh, Penna., succeeding **G. L. Cunningham,** who has resigned.

R. W. Miller

Irving E. Muskat has resigned his position of director of research for the Columbia Chemical Division, Pittsburgh Plate Glass Co., and has been succeeded by **Alphonse Pechukas** as acting director.

FABIAN BACHRACH

A. H. Phelps

Four executives of the Westinghouse Electric and Manufacturing Co. have been elected vice presidents: **Andrew H. Phelps,** of Pittsburgh, Penna., manager of purchases and traffic; **L. E. Osborne** of Philadelphia, Penna., manager of the Steam Division; **Frank C. Reed,** of Jersey City, N. J., president of the Westinghouse Electric Elevator Co.; and **Walter C. Evans,** of Baltimore, Md., general manager of radio, x-ray, and broadcasting divisions.

Harry F. Reid, Jr., has been appointed a research engineer on the technical staff of the Battelle Memorial Institute, Columbus, Ohio, and has been assigned to ceramic research. Mr. Reid was formerly associated with the Ceramic Color and Chemical Manufacturing Co., New Brighton, Penna.

George C. Sheldon, formerly vice president of the General Tire & Rubber Co., Boston, Mass., has been appointed general sales manager of the Union Bay State Co., Cambridge, Mass.

George G. Stoner has been named to the technical staff of the Battelle Memorial Institute, Columbus, Ohio, and is assigned to chemical research. He was formerly associated with the Pittsburgh Plate Glass Co.

James S. Strong is now working at the Naval Research Laboratory, Washington, D. C. He was previously du Pont postdoctoral fellow at the University of Pennsylvania.

Dale R. Torgeson has joined the research and development staff of the Harbison Walker Refractories Co., Pittsburgh, Penna., as chemical engineer. He was formerly chemical engineer with the U. S. Bureau of Reclamation, Department of the Interior, Denver, Colo.

N. Beverley Tucker, formerly in charge of the Organic Research Section, Research Department of Procter and Gamble's Chemical Division, is now with Devoe & Raynolds Co., Louisville, Ky., as technical adviser to William C. Dabney, senior vice president.

Lieutenant Colonel C. E. Watts, formerly of the research staff of the Commercial Solvents Corp., Terre Haute, Ind., was recently promoted from the grade of major. He is on duty in the Ammunition Division, Office of the Chief of Ordnance, Washington, D. C.

James H. Wiegand is now assigned to the Ordnance Staff of the Lake Ontario Ordnance Works, Youngstown, N. Y.

J. W. Young, formerly chemist, Glenmore Water Supply, City of Calgary, has joined the Corps of Engineers, Canadian Army, and is attached as lieutenant to the Experimental Station, Suffield, Alberta, Canada.

Isadore Zipkin, who will receive the Ph.D. degree in biological chemistry at the Pennsylvania State College in August 1942, has been commissioned first lieutenant in the Medical Corps of the U. S. Army.

Chemists Institute Elects Officers

Gustav Egloff was elected president of the American Institute of Chemists at the annual meeting in Atlantic City, May 16. Donald Price is vice president; Howard S. Neiman, secretary; Walter J., Murphy, treasurer; and Henry G. Knight, Foster D. Snell, and Donald E. Andrews, councilors.

Schoellkopf Medal Awarded to Flett

In recognition of research in detergents, Lawrence H. Flett was awarded the Jacob F. Schoellkopf Medal at a meeting of the A. C. S. Western New York Section at the University of Buffalo, May 19. Mr. Flett is a chemist with the National Aniline Division of the Allied Chemical & Dye Corp. Walter Ralph, director of research of National Aniline and a personal friend of Mr. Flett for almost 25 years, introduced the medalist. The presentation was made by Wilmer H. Koch, Chairman, Western New York Section.

Mr. Flett, who was cited for his ability in industrial research "as exemplified by valuable contributions in the fields of dye intermediates, dyes, and detergents, and in further recognition of his encouragement to the spirit of research in industry by precept and example", spoke on "Detergents from Petroleum".

The award was founded in 1930 in honor of Jacob F. Schoellkopf, Sr., a pioneer in establishment of chemical industry on the Niagara frontier, to encourage and recognize the spirit of research in industry.

Herty Medal Presented to Leigh

Townes R. Leigh

The Herty Medal was presented to Townes R. Leigh by the Georgia Section of the American Chemical Society on May 2 at Milledgeville, Ga.

Dr. Leigh is the inventor of the Leigh fog screen for the protection of vessels against submarines, but it was for his work with the soils and plants of Florida that the medal was awarded.

W. H. MacIntire and W. F. Hand, former Herty Medal recipients, with Dr. Leigh

Previous recipients of the medal who were present included W. F. Hand, Mississippi State College, W. H. MacIntire, University of Tennessee; and J. S. Guy of Emory University. Dr. Guy introduced Dr. Leigh at the time of presenting the medal, which was awarded to Dr. Leigh as the chemist in the Southeast who has rendered the most fruitful service in his field.

Midgley Receives Willard Gibbs Medal

The Willard Gibbs Medal, one of the highest honors in American science, was awarded to Thomas Midgley, Jr., vice president of the Ethyl Corp. and chairman of the Board of Directors of the American Chemical Society, at a meeting

Thomas Midgley, Jr.

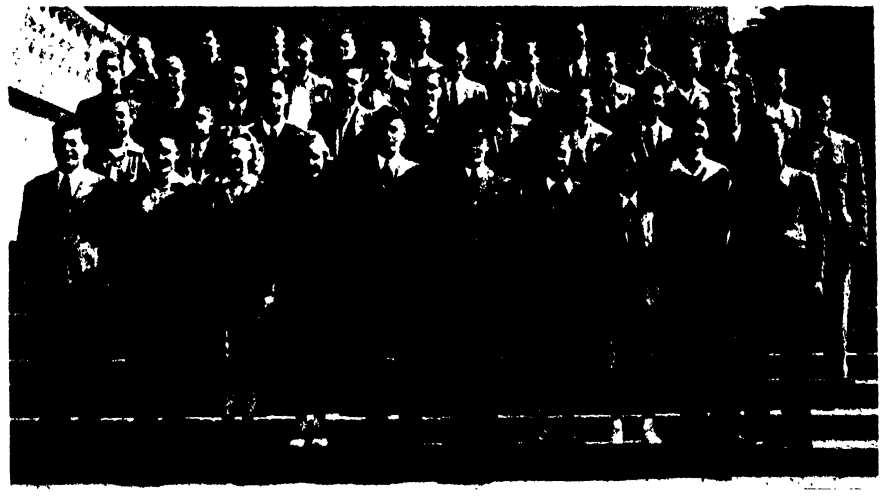
of the Chicago Section of the American Chemical Society May 29. The medal was awarded to Dr. Midgley for his discovery of tetraethyl lead as an antiknock agent in motor fuels, for his development of safe refrigerants, for his contribution to synthetic rubber research, and for other scientific achievements.

L. M. Henderson, chairman of the Willard Gibbs Arrangements Committee, presided at the medal ceremony, which was held at the Stevens Hotel. Harry N. Holmes, President of the American Chemical Society, made the presentation.

Dr. Midgley chose for the subject of his address "A Critical Examination of Some Concepts in Rubber Chemistry". L. M. Henderson spoke on "The Medal and Its Significance", and Robert E. Wilson, president of Pan American Petroleum and Transport Co., on "The Medalist as I Know Him".

Civilian Protection against War Gas

The California Section of the American Chemical Society has collaborated with the Committee on Decontamination set up by the Alameda County Council of Defense in the training of personnel as war gas officers who would be responsible for the detection of gas and the sounding of alarms.



The training was first instituted on a county-wide basis, with about 170 chemists attending three classes, which were concluded early in April. Each of the six major cities of the county has now appointed a resident chemist as city war gas officer. The organization of decontamination stations and decontamination squads is in most cities segregated under associate war gas officers. Each squad is in charge of a chemist who is responsible to the city official in charge of demolition, rescue, and related work. T. D. Steward, Department of Chemistry, University of California, Berkeley, Calif., is chief war gas officer for Alameda County.

OCD Announces Plastic Substitute for Rubber Hose

A satisfactory plastic substitute for rubber hose has been developed to be used in connection with the stirrup pump recently designed by the War Production Board for the Office of Civilian Defense.

Tests of other materials which might prove satisfactory for this purpose are continuing, OCD says, and results of experiments will be announced shortly. Specifications for the plastic hose will be made available to manufacturers within the near future.

James P. Danehy, for the past four years research chemist for the Harris-Seybold-Potter Co., Cleveland, Ohio, has resigned to accept a position with the protein group, Research Department, Corn Products Refining Co., Argo, Ill.

University of California Chapter of Student Affiliates, American Chemical Society

Drying Processes with Gas Heat[1]

DON D. BEACH

Atlanta Gas Light Co., Atlanta, Ga.

In drying, the process of removing water from a body or from the surface of the body being dried, water is evaporated and usually leaves as a vapor. Speed of drying can be increased through greater air circulation and lower relative humidity. Air circulation is attained simply. The relative humidity may be lowered by increasing the temperature of the air or body or by removing moisture from the air before it comes in contact with the work. Raising the temperature of air increases its capacity to take up water. Extracting moisture from the air with a dehumidifier or dehydrator produces lower relative humidities of the air before it is circulated. Two general methods of lowering the relative humidity of air used for drying have applications within certain well-defined limits.

Many materials such as foods, chemicals, drugs, and leather are harmed by excessive heat and must be dried at low temperatures by the dehumidification method. Silica gel and activated alumina are widely used adsorbents. Adsorbed moisture is, at the proper time and with suitable equipment, driven off by heat. Where a considerable lowering of the relative humidity of the air is required, the direct dehumidification method is preferred. Where a smaller change in relative humidity is required, a liquid type of absorbent agent such as lithium chloride brine or so-called Kathene solution is suitable. The density of the solution and the amount of heat applied affect the effectiveness as an absorbent. The field for direct dehumidification is expanding rapidly, principally because much wartime production is dependent on controlled atmospheric conditions. For reasons of economy, however, such methods are not to be used where higher air temperatures can be used for drying.

Most drying is accomplished by the warm air convection method, although it is sometimes possible to use radiant heat. Advantages of infrared or radiant drying are said to be speed of drying, light weight of drying ovens which makes portability possible, and low initial cost. A few of the disadvantages are unfavorable drying and curing of certain finishes and, where polished bases lie underneath, unequal drying of parts not of uniform thickness.

The Nation, as never before, is dependent on adequate and satisfactory supplies of food. Gas is doing its part in processing vital foods for consumption at home, in England, Russia, Libya, and the Western Pacific. Gas is widely used in humidity and temperature control for the curing of sweet potatoes by new processes developed by the U. S. Department of Agriculture. Eggs, milk, fruits, coconuts, tomatoes, molasses, and even bananas are dehydrated by gas heat. The resulting powders occupy far less ship space than normal and often eliminate the need for refrigeration.

In clothing production gas serves an equally important role. Gas is widely used in the ginning of cotton, as drying prior to ginning increases the quantity and quality of lint obtained by increasing the length of staple. Practically every article of clothing, especially shoes, requires drying or carefully controlled humidity conditions in its manufacture.

Gas, because of the close control possible, is widely used in treatment of lumber. Atmospheres surrounding the lumber are first kept highly humid to prevent excessive end checking. As drying progresses the relative humidity of the air is lowered, and the drying is accomplished in hours compared with days formerly required. Furniture is only one of many items requiring this preliminary raw material treatment.

In the construction field gas drying also plays an important part. Brick and tile for building must first be dried before they are fired at higher temperatures. Hardware, iron sheets, wire for nails, and countless other shapes are all dried quickly after pickling and washing to speed the production program. Wall- and plastic-board production requires enormous amounts of heat for drying and forming, and here too gas is extensively used.

In the production of tanks, trucks, automobiles, guns, and planes gas drying is essential. Cores as small as a pencil and those literally as big as a barn are all needed, and gas is unsurpassed for this work. In some installations a movable crane carries a gas-fired air heater that efficiently dries the cope and drag of the huge floor mold, necessary in the production of a tank body. At the same time a gas fire dries the pouring ladle subsequent to pouring steel in this and other similar molds.

Newspapers and magazines require drying. Gas drying heats as high as 350° F. are used in spud presses to prevent the smear of ink and colors. Humidity conditions must be right for fine printing and engraving.

More than 75 per cent of the kaolin used in this country is mined, processed, and dried in Georgia, and 80 per cent or more of this with gas heat. The drying methods used, however, are varied and undoubtedly parallel drying processes in other lines.

In 1741, when production and shipment of kaolin from Georgia to England for the famous Wedgewood potteries was first recorded, it was air dried on wooden poles in sheds by the sun and wind. This method doubtless continued for many years and ruins of such a drying arrangement still remain near Macon, Ga. Later wood- and coal-fired boilers generated steam that heated pipe coils on which the crude clay or filter cakes were placed. Next tunnel dryers through which cars of clay were pushed, and later indirect rotary dryers through which the clay moved by gravity, came into use with coal, both hand- and stoker-fired, as the source of heat.

When natural gas was made available in 1930, efforts were first directed toward replacing solid fuel by converting the existing drying equipment to gas. This proved not unwise for many of the installations made then are still operated. However, it became apparent during the depression of the early 30's that, if this business was to be held without rate reductions and expensive services, some more economical method of drying must be developed. Because of the whiteness of the clay, direct heat drying was believed by the kaolin industry to be impossible. However, the necessary trials, made after persistent experiments, were so successful in every case that today the big majority of the clay produced where gas is available for drying is dried by direct-gas applications.

Rotary dryers, such as those manufactured by Christie, Ruggles, and Louisville, are fired indirect and semidirect by gas. Air is partially recirculated and is in some cases exhausted into direct drying ovens for the final extraction of heat. Most of these dryers are used for reducing the moisture content of the clay from 20 or 30 per cent to 5 or 8 per cent. Where moisture content as low as 1 per cent is required, the clay is often pulverized and dried in a Raymond impact or roller mill with the air heated in a direct-fired air heater supplied at the bottom of the mill, and with the drying being completed as the minute particles of clay are carried upward to the separator. This is an excellent method of drying since the last few per cent of moisture are difficult to extract when the clay is in lumps, for in thorough drying there is danger of burning or calcining.

Tunnel dryers are often operated by using steam coils for heating the air and fans for circulating it. While gas-fired boilers are used for generating the steam,

[1] Abstract of a paper presented before the American Gas Association, Industrial and Commercial Gas Conference, at Pittsburgh, Penna., March 12 and 13, 1942.

the most economical operation seems to be obtained by replacing the boiler and steam coils with direct gas-fired air heaters. Most of these air heaters are of corrugated culvert pipe, lined with firebrick and insulating material. These have a heat input rating of 10,000,000 to 20,000,000 B. t. u. per hour. It has been found advantageous to use a preheating chamber for slowly heating the cold clay with nearly saturated air taken from the main body of the dryer. This preheating prevents case hardening of the clay with subsequent slow release of moisture from the center of the clay. Temperatures of air are controlled automatically at the point of entry to the tunnels, and temperatures in the oven itself are observed as necessary. Sail switches installed in the fresh air intake to the air heaters guard against power failures that might destroy the heaters, since no vent is provided other than through the fan and oven itself.

Some clay drying is done on large, internally steam-heated drums around which are wrapped cords that run through a vat of slip. As the clay is dried by the hot drum, the strings flex and the dry clay is released, to be carried away in a screw conveyor. A recent adaption to gas of a dryer for clay, hitherto largely used in the textile industry for drying yarns, is one made by Proctor & Schwartz. The steam coils in this are replaced with direct gas-fired air heaters of a large size. The clay is extruded through a drilled plate some 6 feet in width and is then carried on a steel mesh belt through the dryer. The clay lies on this belt in the size and shape of macaroni, piled to a depth of 3 to 4 inches, and the heated air readily passes through it for quick and efficient drying.

In one of the most recent installations clay in about the consistency of milk is to be sprayed through specially designed nozzles in the roof of a spray dryer, as made by Tur-bulaire. As this slurry is atomized, heated air furnished by a direct gas-fired air heater and mixed with stack gases from a 400-horsepower gas-fired boiler instantly dries the clay. By the time gravity has pulled it to the floor of the dryer, the clay is in powder form, ready to be removed through the outlet doors provided. While this particular unit is not yet in operation, it is believed that the drying will be economical and satisfactory. Another novel kaolin-drying process is that of intimately mixing superheated steam, produced in a gas-fired boiler and separately gas-fired superheater, with pulverized clay, but this is more a means of obtaining a special quality of clay than of drying.

Industrial Gas Goes to War!

HENRY M. HEYN

Heat Treating Division, Surface Combustion Division of General Properties, Co., Inc., Toledo, Ohio

THE 30-ton tank rumbling across the battlefield, the airplane rocketing through the sky, shell after shell plumeting on its way of destruction, the precise instruments which calculate its path, the ships, cars, communication systems—all these and many more could not be possible in the enormous quantities in which the Nation needs them so badly if, during our all too brief period of peace, we had not utilized our greatest ingenuity and energy toward the solution of problems arising in the normal furtherance of peacetime pursuits.

Scientific research of the practical type has in the past 24 years been the most important item in the advance of industrial gas. We were not thinking in terms of guns and armor plate when, in the steel industry, radiant-tube annealing covers helped make possible the success of the continuous strip mills. We did not think in terms of shells when the problem of improved combustion for forging furnaces was the problem of the hour. When modern tube mills, with their controlled atmosphere, bright annealing and normalizing furnaces were developed, we were not concentrating on the production of planes. No thought of siege guns or blitzkreig entered our minds when the short cut using industrial gas made possible the production of malleable iron in 110 hours less than just a few years ago. Few, if any of us, had ever imagined an airplane flying and fighting at 25,000 feet when we concentrated our efforts on the wire industry and by direct gas-flame annealing made possible wire with qualities thought a wild dream just a decade ago. The gas furnace that this very moment is turning out 82 miles of 50-caliber machine gun bullet clips a day was never conceived with that idea in mind. Controlled atmosphere furnaces in the brass and copper industry for the annealing of nonferrous metals, so important in the manufacture of cartridge cases, were only a short time ago little more than interesting theoretical discussions.

Because it is a principle of Americanism to support private enterprise, these wonders of processing were made possible. We wanted better steel for household appliances, automobiles, surgical instruments, tools, and all of the products which are no longer luxuries to our civilization. We wanted wire—better, stronger, cheaper—to extend our lighting systems, our communication systems. We delved into the secrets of nature, into the secrets of the treatment of metal that controlled atmospheres made possible, because we wanted our world to be a better place in which to live.

Yet with all these peacetime accomplishments we could not forestay greed and avarice and so our problem of the hour, at the challenge of the hour, becomes one of a peculiar character. Now we must apply those research and engineering accomplishments of peacetime years to the mechanics of war.

A good example is the rotary gas furnace, designed during World War I for shell nosing. After the forging operation, the next step in making shells is the tapering of one end to reduce air resistance and increase penetrating power. Some projectiles are nosed cold, but all the large projectiles are tapered under high heat. For these a temperature of about 1,850° F. is necessary for forming. In the rotary furnace of World War I many advantages are to be had, particularly because this furnace ensured a definite time-temperature cycle. The only disadvantage in the older, original furnace was the scaling. It was diffiult not to get a hard, tight scale on the shell which was injurious to the dies and sometimes worked into the projectiles themselves. With this old furnace equipped with the recently developed gas variable-flame burner, firing directly and vertically down into the furnace, this objection is completely overcome. During World War I, the cost of 155-mm. shell was somewhere in the neighborhood of $45. Today the same shell, of better quality and produced in much greater numbers, is being made for less than 50 per cent of the old cost.

Another example is the manufacture of cartridge cases. One of the earliest studies sponsored by the American Gas Association Committee on Industrial Gas Research dealt with clean annealing of brass and now this peacetime industrial gas research is bearing fruit. Cartridge cases require three, four, or even five drawing operations, depending on the process and size. These operations harden the brass, and after each draw an annealing or softening process at temperatures from 1,200° to 1,250° is used to prevent cracking of the metal in the subsequent draw. Knowledge gained in the early research on clean annealing of brass was applied to the present-day manufacture of cartridge cases,

[1] Abstract of a paper presented before the American Gas Association, Industrial and Commercial Gas Conference, at Pittsburgh, Penna., March 12, and 13, 1942.

and the convection-type furnace was found to give a faster rate of heating, better temperature uniformity, and greater economy than the older, outmoded, direct-fired furnaces.

Not many years ago convection heating, which represented radical departures from traditional principles used in the glass lehrs, was introduced in the glass industry. By the use of convection heat and automatic proportioning gas-burner equipment, the old cumbersome muffles, hot dampers, and complex flue systems were eliminated. Since the atmospheres within the lehr are continuously maintained at positive pressures, operation was unaffected by prevailing air currents in the room, one of the old bug-a-boos which caused stratification of hot and cold air within the furnace. Other refinements were made until the glass lehr as developed today represents a compact and durable piece of equipment whose operating and maintenance expense is low. This same gas lehr is now turning our convex and concave inscribed instrument dials, aviators' goggles, and bulletproof cowlings for airplanes. The dials must be precise and accurate. The bending of bulletproof glass and forming of it has been unheard of. The correct shaping of aviators' goggles so as to have the least amount of aberration was quite an impossibility unless the lenses were hand ground. The problem facing the engineers in this case was to use a gas lehr developed for peacetime industry to the necessities of wartime manufacturing.

Our normal automobile industry and appliance industry required such cutting speeds and depths of cuts that the cutting tools became heated to a temperature where ordinary tool steels become soft and the cutting edge was destroyed. This difficulty was overcome primarily by development of high-speed steels. One of the most fundamental elements to be used in high-speed cutting tools was tungsten. All of us are familiar with the 18-4-1 high-speed steel which contained 18 per cent tungsten. When disturbances in other parts of the world prevented our industries from obtaining the amounts of tungsten needed, engineers had either to return to common high-carbon types of steels for tools, which would result in reduced production and considerable increase in machining costs, or to develop something new. This latter was done.

Molybdenum is a satisfactory alloying substitute in high-speed tool steels and a plentiful supply is available. However the main disadvantage against its use was its susceptibility to decarburization during heat treatment. Again the engineers rose to the occasion, and several methods were developed to heat-treat molybdenum high-speed steels satisfactorily. One of the accepted ways of preventing decarburization is the controlled atmosphere furnace. It was found that the decarburizing constituents such as water vapor, carbon dioxide, and oxygen must be kept to a fraction of 1 per cent, and a furnace was developed which had an integral generator for producing the proper atmosphere from a carbonaceous material. The atmosphere, which is produced from charcoal and an oxidizing base gas, consists of about two-thirds inert nitrogen and one-third balanced carbon oxides. With properly controlled atmospheres and proper heat treatment, molybdenum in a great many instances is superior to high-speed tool steels containing the much more expensive and not so readily accessible tungsten.

We could trace the history of the developments of dry cyaniding, the romance and development of DX gases, the production of a new type of malleable iron known as pearlitic iron, of spheroidizing. It would be almost impossible, however, to list the multitudinous applications of industrial gas in our present war manufacturing program—all possible because engineers, during the past 24 years, worked diligently and long and with a faith in the need for advanced development.

Whiting Corp. Expands Plant

APPROXIMATELY 55,000 square feet of manufacturing space will be added to facilities of the Whiting Corp. at Harvey, Ill., under a government-approved building program. Cost of the plant additions is estimated at $325,000, not including the required tools. Construction will begin immediately and, it is hoped, will be completed in the fall.

The increase is necessary to meet requirements of the war program for the company's standard lines of equipment, Howard D. Grant, executive vice president, said. Production records for the 12 months ended April 30 exceeded any previous year in the company's history, 60 per cent greater than the preceding year.

U. S. Aluminum Output to Exceed Two Billion Pounds In 1943

UNITED STATES aluminum production by the end of 1943 will be approximately 2,100,000,000 pounds, six and a half times the 1939 output, T. D. Jolly, chief engineer and director of purchases for the Aluminum Co. of America, told a meeting of the National Association of Purchasing Agents in New York, May 26. Mr. Jolly reviewed the growth and expansion of the aluminum industry in the past few years.

When the company started building for the Government, Mr. Jolly said, buildings and equipment were standardized as much as possible to expedite construction and the start of operations. As an example he cited 175 cranes, all of the same span and capacity, purchased from one manufacturer, which is said to have given the builder 50 per cent more efficiency than with orders for miscellaneous specification cranes.

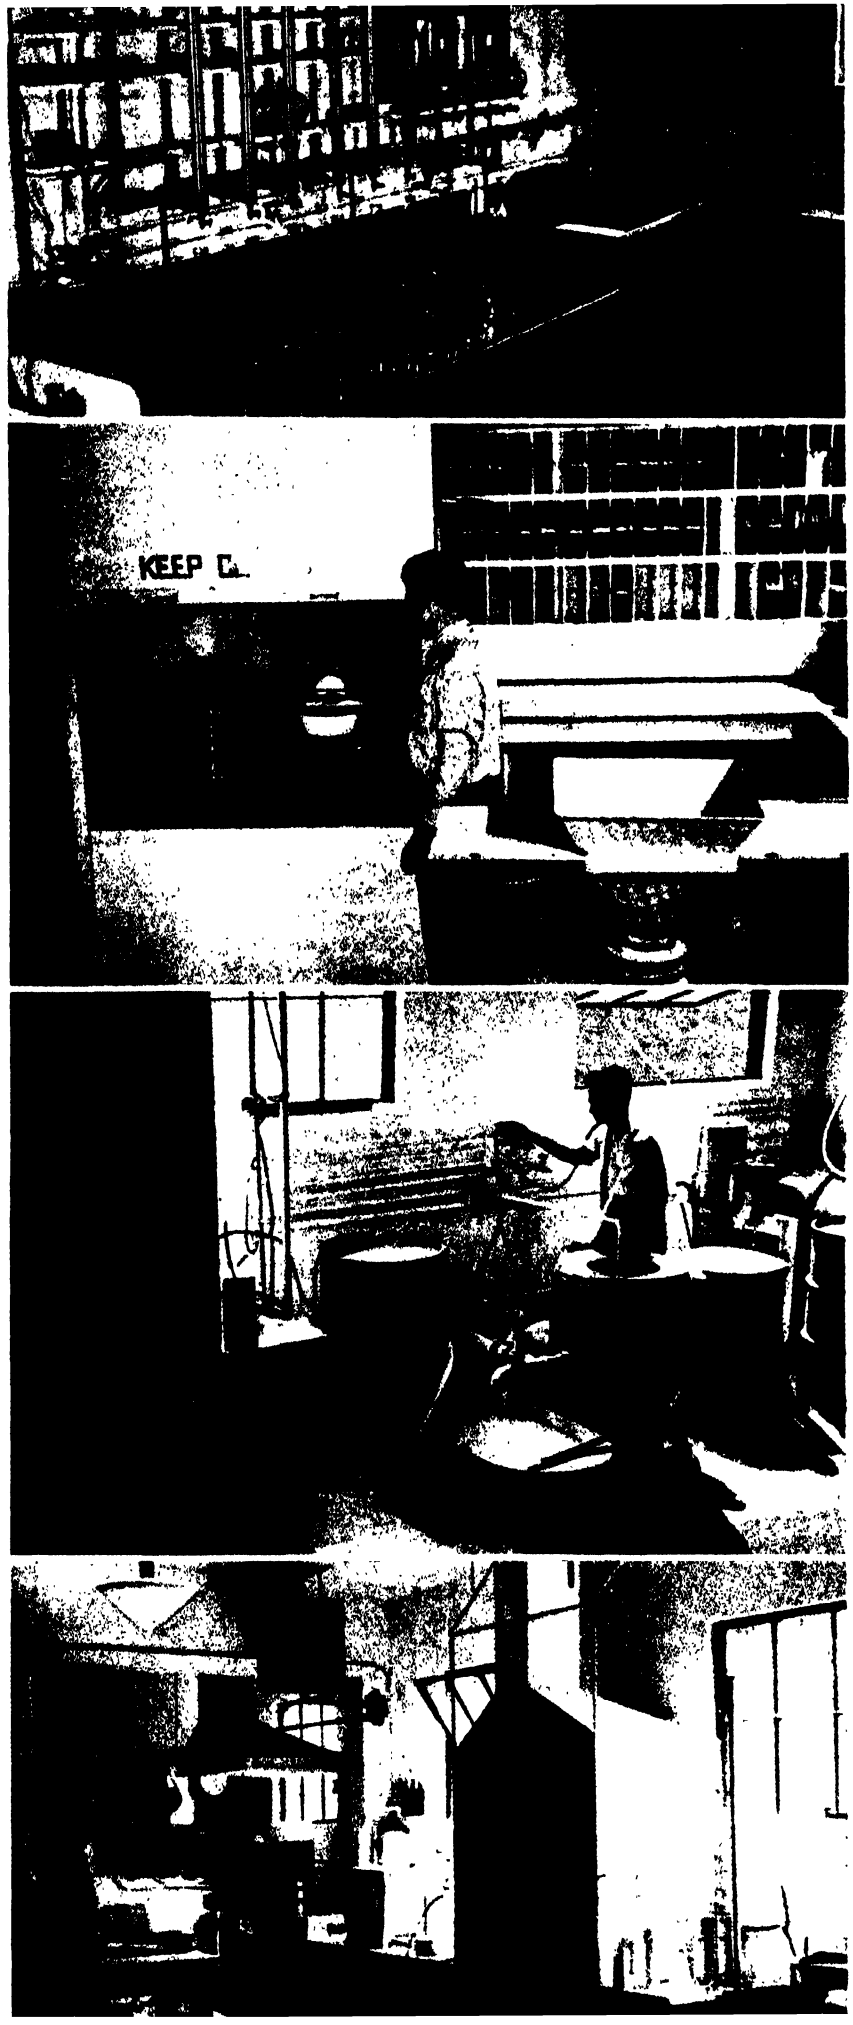
Aside from operating expenditures Alcoa will have spent about $600,000,000 for construction from January 1, 1940, to the middle of 1943. With its own and the Defense Plant Corporation's programs, the company has 35 major projects under way. By May 2, 1942, 108 subcontracts, only eight of which were negotiated, had been placed for DPC.

Wooster (Ohio) Section Elects Officers

THE Wooster (Ohio) Section of the AMERICAN CHEMICAL SOCIETY at its meeting on May 12 elected the following officers who will assume their duties immediately: *Chairman*, Charles H. Hunt; *Vice Chairman*, Walter P. Arnold; *Secretary*, John W. Chittum; *Treasurer*, Roger Buss; *Councilor*, Milton P. Puterbaugh (term begins January 1, 1943). Roy J. Grady is councilor for 1942.

A. C. S. Student Affiliate Chapter at Grove City College, Grove City, Penna.

Floridin Research Laboratory



DOUBLED in size in less than three years, the research laboratory maintained by the Floridin Co. at Warren, Penna., serves the dual purpose of product improvement and customer service. The company manufactures adsorbents from Florida fuller's earth and Alabama bauxite.

Laboratory equipment is generally designed or selected to represent actual industrial equipment on a small scale, with arrangements for investigating and controlling variables. A percolation manifold makes it possible to investigate any procedure in the filter house of an oil refinery and to predict results quantitatively within 3 per cent. A Raymond laboratory mill and Rotex screen are used, not only to determine the actual grinding and screening yields of a particular material in commercial production, but also to predict accurately the physical properties of certain products that are altered by grinding procedures.

Activation equipment consists of laboratory ovens at 400° F., muffle furnaces to 2,000° F., and a flash calciner 1 inch in internal diameter and 10.5 feet tall, which gives temperatures of 1,400° F. or higher. All activation equipment is electrically heated, and high-temperature units are controlled with No. 100-QG2 General Radio Variacs or a Leeds and Northrup indicating and recording temperature controller.

In addition to special colorimeters, viscometers, and other equipment required for standardized tests, there are a leaf filter, Manton-Gaulin colloid mill, homogenizer, and 17-inch centrifuge. Laboratory steam is available at 5 pounds pressure, and compressed air is supplied at 100 pounds pressure from a two-stage Erie compressor originally designed for use in a service station.

A very satisfactory library has been developed at a minimum of expense. A complete set of *Chemical Abstracts* is available for preliminary searches of the literature, and any articles of interest are obtained on 35-mm. film through the Bibliofilm Service, Washington, D. C. Many rare manuscripts otherwise unobtainable have been secured. Translations are available through the Friends of the Hooker Scientific Library.

Top to bottom. **Percolation equipment in the Floridin laboratory; equipment for grinding and screening; centrifuge and accessories; muffle furnaces and hoods.**

POTOMAC POSTSCRIPTS

WPB Activities

Acrylonitrile. To ensure continued full production of Buna-N type oil-resistant synthetic rubber, acrylonitrile (vinyl cyanide), is placed under complete allocation control in Order M-153. Production of Buna-N type synthetic rubber is the sole use for acrylonitrile, which is manufactured by only three companies. Supplies are adequate, according to present figures, but allocation is considered necessary to prevent dislocation of supply and demand because of excessive forward buying.

Aluminum. Transactions involving illegal dealings in aluminum by three midwestern companies have resulted in punitive action. Suspension Orders S-55, S-56, and S-57 penalize O. D. Jennings & Co. and Columbia Metal Co., Inc., both of Chicago, and the Ewing Foundry Co., Indianapolis, Ind.

Aromatic Petroleum Solvents. With the objective of increasing the production of aviation gasoline and nitration-grade toluene, Order M-150 limits the delivery of aromatic petroleum solvents, normally used in paint and other protective coatings, to orders bearing high preference ratings. During the period June 4 to June 14, deliveries may be made only to fill orders to which an A-10 preference rating has been assigned; beginning June 15, the required rating is A-2.

Arsenic goes under allocation control in General Preference Order M-152. While no critical shortage of arsenic is anticipated for the immediate future, it is considered prudent to conserve supplies to take care of any contingency. Arsenic, as defined in the order, means arsenious acid or arsenic trioxide, either in crude (black or gray) or refined form. It does not include any other chemical derivatives or compounds.

Butyl Alcohol of all grades is placed under complete allocation control in General Preference Order M-159. Allocation will start on July 1. Producers are required to use grain to the fullest possible extent in making butyl alcohol and may not use molasses unless their grain facilities are in use to the utmost.

Chemical Cotton Pulp will go under full allocation control July 1, according to conservation Order M-157. Chemical cotton pulp, or chemically treated cotton linters, is used for manufacture of smokeless powder, rayon, plastics, and other important products. While no critical shortage exists at present, the allocation control is instituted to direct available supply into vital munitions manufacture and to prevent its use for commercial purposes where substitutes are available. High alpha-sulfite wood pulp can be used for many such purposes.

Chemical Industries. Vital chemical war industries are granted further priority assistance in obtaining maintenance and repair materials by Amendment 1 to General Preference Order P-89. The amendment allows the chemical producer to use an A-1-c rating to obtain 30 per cent of his regular supplies, and an A-3 for the remaining 70 per cent. The original order allowed use of an A-3 rating for the entire quantity. As in the original order, an A-1-a rating may be used to obtain supplies to repair an actual breakdown and an A-1-c rating to avert an immediately threatened breakdown.

The amendment also allows an A-1-c rating to be extended by suppliers to replenish their stocks. The original order permitted an A-1-a or an A-1-c rating to be extended only when the supplier had no stock of the material in question. The supplier had formerly to depend upon an A-10 rating for replenishing his stocks, which was found to be insufficient.

As in the original order, no use of these ratings may be made by any producer or supplier unless he shall have first obtained a serial number from the Chemicals Branch and filed with the branch certain required information.

Dyestuffs. The dyestuffs conservation order, M-103, has been amended to increase the quantity of dyes available for civilian uses. The original order, issued March 28, prohibited the sale and use of 10 dyes for civilian purposes and restricted civilian use of all other anthraquinone vat dyes for the second quarter of 1942 to 12.5 per cent of the quantity of these dyes used during 1941. The amendment removes one of the dyes, Golden Orange G, from the prohibited list of military dyes and changes the quota basis from a percentage of only the civilian vat dyes used in 1941 to a percentage of all the vat dyes used in 1941.

Oils. Control of imports of all known commercial oils not previously under such restriction has been taken by the Director of Industry Operations. The oils were added to the restricted list of General Imports Order M-63. The amendment places also fats, seeds and nuts, cinchona or other bark from which quinine is derived, and corundum under import control.

Steel Drums. Users of metal containers have been warned that an urgently critical situation exists in steel and that immediate and extensive use of substitutes for steel containers, particularly drums, must be undertaken. Materials not needed in war production should be substituted wherever possible, but even critical materials which are less critical than steel can be used where necessary. The Containers Branch pointed out that it is possible steel container users may soon be forced to suspend operations until they are able to develop suitable containers which do not use steel.

Tantalum, the entire output of which is going into vital uses, is placed under complete allocation control in Order M-156.

Price Regulations

Citric Acid. A revision of the maximum price schedule for citric acid, striking at evasive practices which have grown up since the schedule became effective in February, has been announced. The Revised Price Schedule 101, as amended, includes a series of changes in specific provisions of the schedule to conform to established practices in the trade in the light of several months' experience in administering price ceilings on this commodity. Alterations are made in sections relating to transactions covered, credit terms, transportation exports, adjustable pricing, records and reports, and definitions.

Ethyl Alcohol. The sliding-scale method of pricing ethyl alcohol produced from the fermentation of molasses has been revoked because, through United States government purchases of the Cuban crop and resale of such purchases, molasses market price fluctuations have been eliminated. The revocation was made by deleting the specific paragraph providing for this method by Amendment 1 to Revised Price Schedule 28.

RFC Announces $50,000,000 Synthetic Rubber Plant

CONSTRUCTION of a $50,000,000 synthetic rubber plant is scheduled to begin immediately, the Reconstruction Finance Corporation has announced. The plant will be operated for the Government by Rubber Synthetic, Inc., a corporation formed by Standard Oil Co. of Indiana, Sinclair Oil Co., Cities Service, Dow Chemical, U. S. Rubber, and Firestone Tire & Rubber Co. By-products of the Calumet district oil refineries and steel mills will be used to manufacture rubber of Buna-S type.

War Agency Officials Clarify Rubber Situation

To clarify facts about the severe rubber shortage four leading war agency officials have joined in a statement which points out that the shortage is extremely serious, reports to the contrary notwithstanding, and that no rubber of any kind can be spared for purposes not directly connected with the war effort. Donald M. Nelson, chairman of the War Production Board; Arthur B. Newhall, Rubber Coordinator; Joseph B. Eastman, director of the Office of Defense Transportation; and Leon Henderson, administrator of the Office of Price Administration and director of the WPB Division of Civilian Supply, signed the statement.

The situation as described by the statement follows:

The enemy controls 90 per cent of the world's rubber-producing areas, and every ounce of our stock pile is needed desperately for the armed forces. Our biggest stock pile of rubber is on our cars; these tires must be preserved. Autos shelved for the duration for lack of tires put more burden on already overcrowded busses and trolleys. Remember that rubber is precious; save it; every car is now a vital part of the Nation's transportation system.

Background

The amount of rubber which can be made available for civilian, industrial, and essential transportation purposes this year must be held down to not more than 150,000 tons, 79 per cent less than the 700,000 tons consumed for all civilian purposes in 1941. The actual current rate of use, 10,000 tons a month, is 83 per cent less than the 1941 rate of civilian consumption. The 1942 allotments do not include any rubber for new passenger car tires, and are restricted to articles essential to the civilian industrial economy.

In spite of the excellent job the Army and Navy have done in rearranging specifications to reduce the rubber consumption of military articles, our war machine still eats up huge amounts of rubber. The following figures show how the war effort demands rubber that must be made available: a medium tank requires 1,750 pounds; a gas mask, 1.8 pounds; a 10-ton pontoon bridge, 3,200 pounds; a half-ton truck, 125 pounds; a Flying Fortress, 1,250 pounds; the pneumatic rafts carried by planes, 29 pounds each. A 35,000-ton battleship alone requires 150,000 pounds, or enough to equip 2,000 passenger automobiles complete with spare tires.

Synthetic

WPB is making every effort to expand the production of synthetic rubber and is investigating every possible new process, but all the information we have shows that every pound of synthetic rubber which this country will be producing at forced draught between now and the end of 1943 must be reserved for direct and indirect military purposes. None can be made available for the manufacture of tires for nonessential civilian purposes.

The War Production Board has set a goal of 800,000 tons as the production rate to be reached by the end of 1943. Of this, production of Buna S, a butadiene type synthetic is to reach a rate of 700,000 tons by the end of 1943. The balance is made up of butyl and neoprene. But reaching a rate of 700,000 tons is a much simpler thing than actually producing that much rubber in a year.

The present program calls for production of over 300,000 tons during the calendar year of 1943. In addition, the Rubber Coordinator's office is studying the possibility of increasing the currently planned production of synthetic rubbers other than the Buna S. Many difficulties remain to be solved.

Rubber Salvage

All old scrap rubber can be reclaimed and used over again. Reclaimed rubber can be mixed with crude rubber to form a compound usable in many products, military as well as civilian. But we cannot process rubber that is in the basements or back yards or garages of the country. Old tires, tubes, rubber shoes, hose, bathing caps, and other articles must be turned in, in ever-increasing quantities, if we are to maintain the capacity of reclaiming plants. Every American must see to it that every ounce of old rubber he owns gets into war channels.

Guayule

The wild guayule shrub has been producing rubber for years in Mexico, and a small amount of cultivated guayule has been growing in the United States. A recent act of Congress provided for the planting of 75,000 acres of guayule in the Western Hemisphere. Pursuant to this act, all available guayule seeds in the United States have been planted, and from these seedlings will come not only a harvest of rubber-bearing shrubs, but more seeds to increase the plantings. However, it will take four to six years to grow enough guayule rubber to make an appreciable contribution to the supply.

Not more than 10,000 tons annually can be expected soon from Mexican guayule.

South America

Negotiations are in progress with all Latin American countries, and agreements have recently been made with Brasil, Peru, and Nicaragua in which the United States will take the entire exportable surpluses of their rubber for the next five years. This will meet only a small part of our needs. Brasil will be able to ship this country 10,000 to 15,000 tons of crude rubber this year, and perhaps 25,000 to 30,000 tons in 1943. The Peruvian agreement is expected to provide between 6,000 and 10,000 tons over the five-year period.

In 1912 Brasil produced over 40,000 tons of rubber. In recent years, however, the industry has deteriorated and it will take considerable time to revive it. Most of the trees grow wild in the jungle, far from transportation facilities, and points of concentration are few and far between.

Crude Rubber Production in 1940

Crude rubber-producing areas and the areas now Axis-controlled are as follows:

Country	Tons	
Malaya	540,000	Axis-controlled
Netherlands Indies	536,000	Axis-controlled
Ceylon	89,000	Shipments uncertain
French Indo-China	64,000	Axis-controlled
Thailand	44,000	Axis-controlled
Sarawak	35,000	Axis-controlled
North Borneo	17,500	Axis-controlled
South America	17,600	
India	11,500	Shipments uncertain
Burma	9,600	Axis-controlled
Liberia	7,250	
Other African	7,200	
Mexican Guayule	4,106	
Nigeria	2,903	
Philippines	2,267	Axis-controlled
Total	1,387,926	

Of the total, about 1,250,000 tons or 90 per cent are in Axis-controlled areas; and 1,350,000 tons or 97 per cent are either Axis-controlled or originate in areas from which shipment is now uncertain.

Dyestuffs Companies Indicted under Antitrust Act

A world-wide conspiracy to suppress competition in and monopolize the manufacture and sale of dyestuffs was charged in an indictment returned by a federal grand jury May 14 against E. I. du Pont de Nemours & Co., Inc., Allied Chemical & Dye Corp., American Cyanamid Co., General Aniline and Film Corp., General Dyestuff Corp., Ciba Co., Inc., Sandoz Chemical Works, Inc., and Geigy Co., Inc. Among restrictive practices charged in the indictment are allocation of world markets, establishment of limits on the amounts of dyestuffs sold by American manufacturers in foreign markets, fixing of prices at exorbitant levels in the United States, and prevention of small chemical companies in this country from engaging in dyestuffs manufacture.

Assistant Attorney General Thurman Arnold, in charge of the Antitrust Division of the U. S. Department of Justice, said:

The practices charged by the indictment are another example of the influence of cartels on American industry. This cartel has not only resulted in high prices to the American consumer but has also restricted the full development of the chemical industry which is essential to our war effort. The effects of these illegal restrictions on production have not been confined to dyestuffs alone. One of the

principal means of the conspiracy has been restricting the production of the chemical intermediates from which dyestuffs are made and from which important munitions, particularly explosives and plastics, could equally well be made. The chemical industry has been the principal means by which Germany dominated the economy of many countries.

The creation of our new industries by the discovery and development of new chemical products will facilitate the transition from a wartime to a peacetime economy. A free and competitive chemical industry would greatly stimulate such developments. We hope that this indictment will eliminate the monopolistic practices which have hampered the full expansion of our chemical industry.

Individual defendants named in the indictment were Bertrand A. Ludwig, Charles F. Weber, and F. J. Emmerich, vice presidents of Allied Chemical; E. R. Ellis, foreign sales manager, Guy W. Talbert, general manager, and E. M. Maxwell, domestic sales manager, of National Aniline and Chemical Division, Allied Chemical; Lammot du Pont, chairman of the board of directors, W. S. Carpenter, Jr., president, F. W. Pickard, vice president, Cesare Protto, director, Dyestuffs Division, and Ambrose R. Chantler, director of sales, Dyestuffs Division, of du Pont; Ernest K. Halbach, president, and Rudolph Lenz, vice president, of General Dyestuff; F. M. Fargo, Jr., vice president and director, and Sidney C. Moody, sales manager, Calco Chemical Division, of American Cyanamid; Hans Aickelin, former vice president of General Aniline; Walter Saenger, vice president, and William Zipse, vice president, of Geigy; Edgar Gossweiler, vice president and treasurer of Sandoz; and Alfred Lichtenstein, president of Ciba.

Chemical Manufacturers' Indexes

FEBRUARY index of the value of chemical manufacturers' inventories was 150.9 compared with 147.8 in January and 118.1 for February of 1941, taking the average month of 1939 at 100, according to the survey of the U. S. Department of Commerce. During March the index of the value of chemical manufacturers' inventories was 155.3 compared with 119.1 in March of 1941.

The department's figures show also that the index of the value of chemical manufacturers' shipments for February was 181 compared with 184 for January and 146 in February of last year. The March index was 175 compared with 137 in March of 1941.

A COOPERATIVE arrangement has been effected between the U. S. Bureau of Mines, the Chemical Warfare Service, and the University of Maryland whereby work on problems relating to extinguishing incendiaries will be done at the War Department Civilian Protection School, College Park, Md.

$4,000,000 Recommended for Helium Expansion

A $4,000,000 emergency program for expansion of helium production has been recommended by the Senate Appropriations Committee. This amount, which would be spent by the U. S. Bureau of Mines on new wells and helium plants, is needed for military requirements, particularly an increase in the number of blimps used on coastal patrols.

Another appropriation in the bill is for $600,000 for research on methods of smelting sponge iron, which can be used instead of scrap iron in steel production, by gaseous and solid-fuel reduction.

Copper Production for 1941 Up

COPPER production from domestic mines, including Alaska, was 83,219 short tons in December, an increase of 6.9 per cent from that of November, according to the U. S. Bureau of Mines. Estimates for January 1942 indicate an output of 82,772 tons, a decrease of 447 tons from that of December 1941. Total production of recoverable copper for 1941 is calculated at 958,226 short tons and indicates an increase of 80,140 tons or 9.1 per cent over the 878,086 tons produced in 1940.

Fred D. Barber formerly chemist for the National Steel and Copper Plate Co. has become chief chemist for the Perfex Corp., Milwaukee, Wis.

The Chemist's Chance

Editor's Note. "The Chemist's Chance" by Otto Eisenschiml, published in the March 25 issue of CHEMICAL AND ENGINEERING NEWS, page 368, was thought provocative as evidenced by the following letters. We regret that space does not permit printing all the comments received, but those that follow are typical. Several trenchant anonymous letters were submitted which we would be glad to print were it not against our policy to publish anonymous material.

IN THIS article, "The Chemist's Chance", Mr. Eisenschiml has scored direct hits a number of times. Unpraised, unsung, and unappreciated even by himself, nevertheless the chemist today is a most potent factor in industrial America. In times of peace he unconsciously prepares the world for war. In times of war he labors towards that ultimate peace. But, as Mr. Eisenschiml says, he is practically the forgotten man—or better yet, the unknown man.

If American chemists would appreciate their own strength, they would demand and they would receive suitable recognition of their great contribution to the general economy of this land. Not only could they raise their social standing, which is another way of saying they could command greater respect from their fellow men in other fields, but the family budget could be made to ensure the more abundant things in life, which is now the habit of those whom Mr. Eisenschiml calls the noncreative members of society. Can anyone picture this land without the contributions made by the chemists of the past three decades? And what have they to show for it all?

On every hand one hears the cry, "Awake! Awake before it is too late!" That certainly applies to the chemist. If he does not wake up to the realization that his future for the next thousand years, to paraphrase a "certain gentleman", depends on his willingness to join others in demanding a just share of the good things he creates, then there is little hope for his betterment. And he will not be able to blame it on the fifth "communists".

EDW. LYONS
PARKE, DAVIS & CO.
DETROIT, MICH.

I HAVE read with interest the article in your March 25 issue of CHEMICAL AND ENGINEERING NEWS on "The Chemist's Chance" by Otto Eisenschiml.

I agree heartily with the statement made by the author and believe that every opportunity should be taken to publicize the profession of chemistry and the individuals who are contributing constantly to the greater welfare of the Nation and the world at large.

I feel that there is a very tragic result of the circumstances which the author outlined but which he did not mention. That is, the thousands of chemists stuck away in cubby holes throughout the Nation who, through failure to attain pecuniary rewards and social standing comparable to the abilities which they had at one time, have become decadent and have no more value to the chemical profession than the high-school-trained technician.

This is particularly tragic when we think that the majority of these people graduated from college with at least a basic training in chemistry and a zest and desire to accomplish things in the field of their chosen profession but have "back-slid" to nonentity because of the simple fact that their zest was gradually dulled and finally killed. The result is that they are definitely in a rut, satisfied with the assurance of a reasonable salary, and actually contribute little or nothing to their originally chosen profession.

In this light, the program suggested by the author should be further accentuated in order to prevent the reoccurrence of such things happening to the future

graduates of our many colleges of chemistry.

I do not offer a solution, simply am adding my comments to those of the author.

C. N. SPRANKLE

SEARS, ROEBUCK AND CO.
TECHNICAL LABORATORIES
DEPT. 817, CHICAGO, ILL.
April 23, 1942

YOU asked in your March 25 number for comments on "The Chemist's Chance". Here goes:

Mr. Eisenschiml is right when he says that the *routine* analytical work ought to be done by technicians. What possibility has an analyst in a steel mill or brass foundry for research work? He has to repeat day after day the same analysis and has no time to look for new methods. Research requires too much time.

But Mr. Eisenschiml does not go far enough. Social status can only be raised if and when the chemists receive higher salaries. As it is now any ship caulker gets more. Why should every doctor or lawyer, with a bit of a name only, be able to make from $10,000 a year? Why not the chemist? And why should a company have all the rights to a process developed by one of its chemists without being forced to give the inventor his dues?

It is true that all great chemical innovations today are teamwork. But that does not exclude that there is always a chemist who had the right idea and whose name is suppressed by his company in the name of teamwork. And the director of research is thus enabled to accept for *himself* and the unknown chemists a medal from the A. C. S.

Now, therefore, is the time, as Mr. Eisenschiml says, to grab our chance.

OSKAR HOROWITZ

235 LEFFERTS AVE.
BROOKLYN, N. Y.
April 6, 1942

EVEN the most extended imagination could never say that all the 30,000 paid-up members of the AMERICAN CHEMICAL SOCIETY (and they are paid up, too; the Secretary sees to that) are professors or executives. Assuming that 75 per cent of the membership does not classify under either of these two groups, there are 22,500 members who are employees in various degrees of standing in the industry and profession. (In the paragraphs that follow the term "employee" refers to this group.)

With the large number of members now belonging to the AMERICAN CHEMICAL SOCIETY, the SOCIETY has taken on a new character. In a small way this is recognized by some recent activities, especially by a resolution adopted by the Directors at their meeting September 8, 1941, where the relationship between employer and employee is discussed. It is evident that the Directors realize that the SOCIETY owes something besides supplying superior chemical information to its members and especially to its 22,500 employee group.

It is a serious matter if the employee group of chemists as a whole is paid considerably less than its training and intellectual equipment would justify. Many are under the impression that in numerous instances the manual laborer in the same industry with the chemist is paid more than the chemist who is doing essential work in the laboratory—work which makes the whole operation possible and the undertaking a success. For really authentic information on that point we shall have to wait for the publication of the report of the Committee on the Economic Status of the Chemist, presented in outline at Memphis. But the manual laborer's work is visible and tangible, whereas the chemist's is invisible, and his accuracy and intellectual skill cannot be measured by a foot rule or tested under air pressure. The laborer, by joining together with others, is able to make his claims vocal and forceful, but at present this is not true of the chemist.

The chemist owes it to himself and to the community to see that he receives a wage commensurate with the value of the services that he is giving. The AMERICAN CHEMICAL SOCIETY has taken a first step by passing the resolution referred to above, but it should give its employee members a helping hand, so that they need not carry out their fight for social recognition and adequate pay alone.

Group organizations are recognized in all branches of activity to protect and further the interests of the individual groups, be these interests social or economic. Therefore it is time for the AMERICAN CHEMICAL SOCIETY to remember its obligation to the three quarters of its membership who are employees. The SOCIETY should through an active effort make the economic and social well-being of the employee group one of its most important aims. It would be a misfortune if such help came from sources outside of the SOCIETY.

The intellectual end of the SOCIETY works in high gear; the interests of the employee members should be equally vigorously fostered and improved, that they may take their place in the community where they belong. How can this be accomplished? The first step would be to install an official in the SOCIETY, who would be a contact man between the employer and the employee. The right man, with a judicial outlook, could bring about improvement in the condition of chemists, and if carried out intelligently, courageously, and honestly this would result in a cohesive strong SOCIETY. A natural corollary would be a still greater increase of members and an AMERICAN CHEMICAL SOCIETY with real weight in the comumnity and the affairs of the Nation.

NECROLOGY

Arthur A. Backus

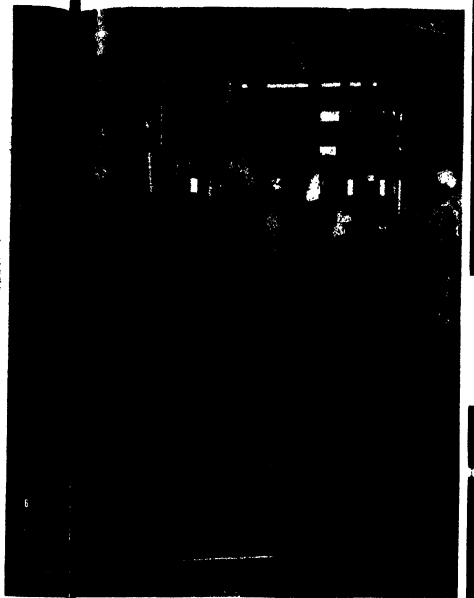
ARTHUR A. BACKUS, vice president in charge of production of U. S. Industrial Chemicals, Inc., died suddenly on May 18.

Mr. Backus was born August 30, 1889, at Madison, S. Dak., and received his B.S. degree from the University of Rochester in 1913. After a year of graduate study at the University of Michigan he entered the employ of the United States Industrial Alcohol Co. From 1916 to 1924 he served as director of research, and from 1924 to 1928 was production manager. In 1928 he was appointed to the position which he held at the time of his death. He was also a director of the Stroock & Wittenberg Corp., Cuba Distilling Co., Dominican Molasses Co., and the Porto Rico Mercantile Co. He had rendered invaluable service to industry, and the operation of the Curtis Bay plants under his direction during the First World War was an outstanding achievement.

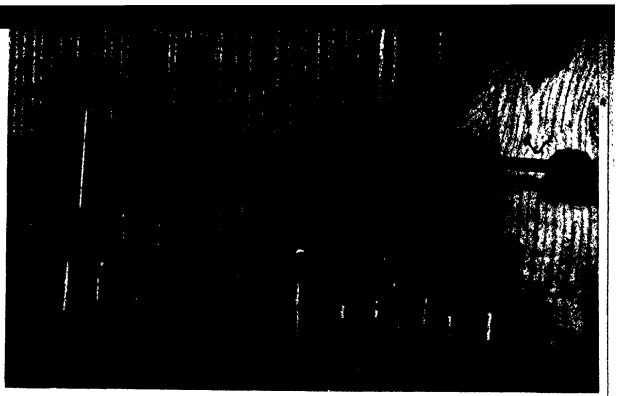
Mr. Backus had been a member of the AMERICAN CHEMICAL SOCIETY since 1915. He also belonged to the American Institute of Chemical Engineers, the Society of Chemical Industry, and The Chemists' Club of New York.

Turpentine and Rosin Report Year Ended March 31, 1942

THE eighth annual naval stores report of the U. S. Department of Agriculture, prepared by the Bureau of Agricultural Chemistry and Engineering, contains no entries on exports and imports for the last 12-month season of April 1 to March 31. These figures are "not available for publication". However, the report provides tables on production, carry-over, supply and distribution, and details on the various types of turpentine and rosin on the basis of origin.

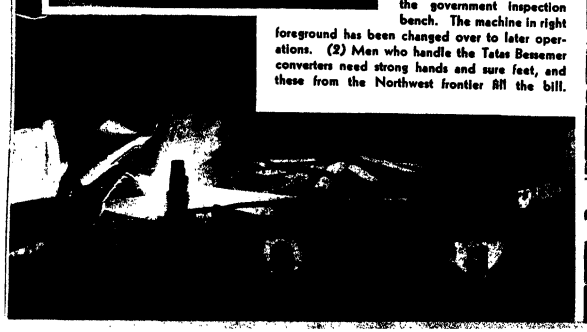


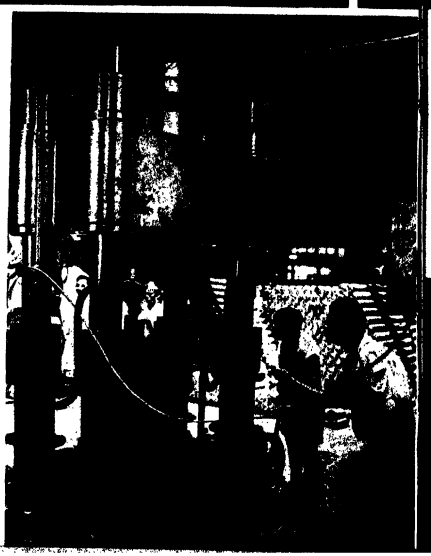
Production for the year ended March 31 totaled 548,796 fifty-gallon barrels of turpentine and 2,135,593 five-hundred-pound barrels of rosin—17,545 barrels less of turpentine and 11,272 barrels less of rosin than the previous year. There was an increase in liquid "sulfate wood rosin" from 18,358 tons in 1940–41 to 26,887 tons in 1941–42. The report also contains monthly turpentine and rosin prices for all seasons beginning with 1921–22.



A free copy of the report may be obtained by addressing the Bureau of Agricultural Chemistry and Engineering, U. S. Department of Agriculture, Washington, D. C.

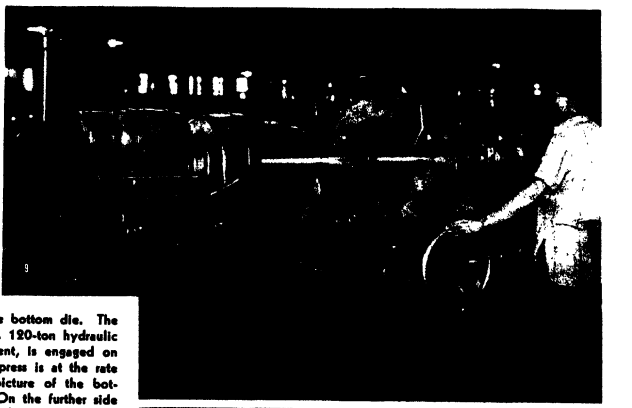
THE CHEMICAL NEWS PARADE

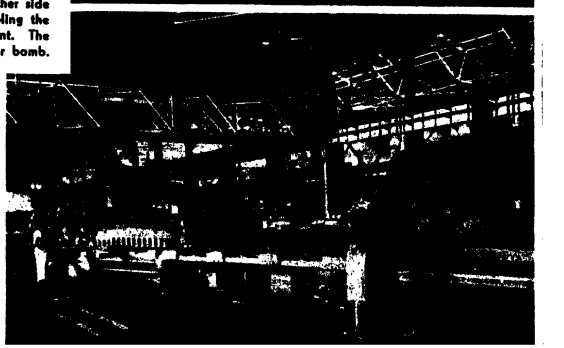


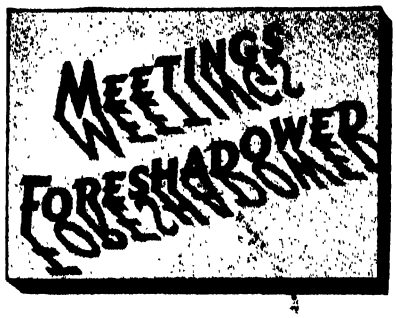


In the photographs on these pages the activities of industrial wartime India, described on page 726 of this issue, are depicted. Some scenes show large-scale production of iron and steel by the well-known Indian company, Tatas, the pioneers of Indian heavy industry.

Others were taken at a railway workshop somewhere in India and indicate how the plant has been adapted to munitions production, contributing to the national war effort. *(1)* In the munitions plant are pictured shells at the finished boring stage. Shells in right-hand chute have been finish-bored and are being sent to the government inspection bench. The machine in right foreground has been changed over to later operations. *(2)* Men who handle the Tatas Bessemer converters need strong hands and sure feet, and these from the Northwest frontier fill the bill.







(3) Seam welding a fabricated gun-firing platform at the converted railway workshop. The welding is done electrically. *(4)* Here is a section of the railway workshop's foundry where covers are being fitted to mold of thread milling machines. *(5)* A view of the 250-ton bottling press used in production of munitions. The bottled shell can be seen in the bottom die. The shells in the background are ready for bottling. *(6)* A 120-ton hydraulic press, more of the railway workshop's wartime equipment, is engaged on the cracking of 4-inch shell bar. The output from this press is at the rate of one every 35 seconds. *(7)* From Tatas comes a picture of the bottom of the blast furnace showing the hot blast pipes. On the further side of the furnace the metal is running out into ladles. *(8)* Assembling the noses onto the punches for 4.5-inch shells at the railway plant. The completed one at left is a punch and nose for "A3" trench mortar bomb.

(9) A field-gun axle being ground to fine limits for the ball or roller bearing. *(10)* At Tatas the sheet mill runs day and night but is closed on Sunday for mechanical overhaul. Packed sheets are in foreground; the hot mill is in background. As many other countries, India is looking forward to postwar days when her greatly expanded industries will not be engaged on urgent war contracts, and the government has already appointed a Reconstruction Committee to study postwar economy.

The latest list is printed on page 601 of the May 10 issue.

Plant Conversion Round Table

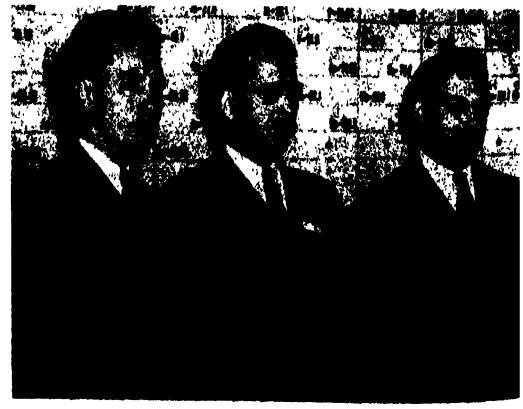
THE third annual meeting of the Institute of Food Technologists, to be held in Minneapolis, Minn., from June 15 to 17, will feature a round-table discussion of ways and means of converting idle or adaptable plant production capacity to the making of products essential to war. A similar session will be held on educational requirements of food technologists.

Hudson Announces First Synthesis of Lactose

C. S. HUDSON, United States Public Health Service, made the first public announcement of the synthesis of lactose at the 109th meeting of the Central Pennsylvania Section of the AMERICAN CHEMICAL SOCIETY held in the New Physics Building, State College, May 27. The structure of this characteristic sugar of the mammalian world has been known for some time, thanks to the methylation studies of Sir James Irvine and of W. N. Haworth. Lactose had never been synthesized, however, until the recent accomplishment in Dr. Hudson's laboratory at Bethesda, Md., in which work he was assisted by W. T. Haskins and Raymond M. Hann.

The difficult step in the process was the obtaining of a suitable intermediate having as its only free and reactive group the 4-hydroxyl. Strange to say, this appeared in the form of mannosan, the anhydride of mannose having 1,5- and 1,6-rings. This was first obtained by the destructive distillation of vegetable ivory obtained as waste from button manufacture. Later, for the sake of completeness in the synthesis, it was obtained by the Tanret reaction of barium hydroxide on beta-phenylmannoside. Mannosan has the 2,3,4-hydroxyls free. Treatment with acetone blocks the *cis*-2,3-hydroxyls, leaving the 4-hydroxyl as the only free reactive group. Treatment with bromotetraacetylgalactose gives the desired beta-linked galactose residue in the 4-position. Treatment with 80 per cent acetic acid removed the acetone, leaving the 2,3-hydroxyls free. These are then acetylated by acetic anhydride and pyridine. Treatment with a mixture of acetic anhydride, glacial acetic acid, and sulfuric acid opens the 1,6-ring in the mannose part of the molecule. Treatment with hydrogen bromide gives the 1-bromo compound. Zinc dust is then used to remove this atom and the acetate group from the adjacent carbon, thus leaving the hexaacetate of lactal having a double bond in the 1,2-position of the original mannose moiety. Treatment with perbenzoic acid adds two hydroxyls, fortunately in the configuration of glucose. Removal of the six acetyl groups by treatment with sodium methylate gives crystalline synthetic lactose.

REPORTED BY FRANK C. WHITMORE



Mid-Hudson Section Holds Charter Meeting

Carroll W. Griffin, Chairman-Elect, and Per K. Frolich, guest speaker, at the charter meeting of the Mid-Hudson Section

AT THE charter meeting of the Mid-Hudson Section of the AMERICAN CHEMICAL SOCIETY in Poughkeepsie, N. Y., May 19, Frank H. Bruner was elected Chairman; Carroll W. Griffin, Chairman-Elect; Fred C. Toettcher, Secretary-Treasurer; and Dorman McBurney, Councilor.

Following a banquet, Per K. Frolich, President-Elect of the SOCIETY, addressed the section on "The Rubber Problem".

New officers of Mid-Hudson Section. *Left to right.* Secretary-Treasurer Toettcher, Chairman Bruner, Councilor McBurney

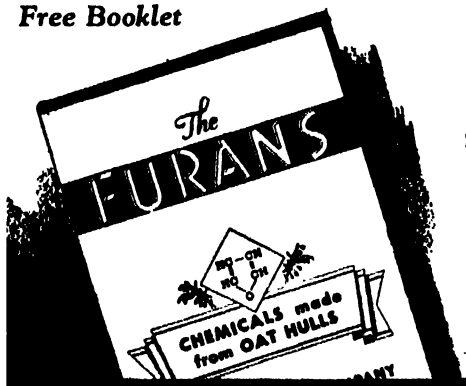
AT THE END OF THE RAINBOW

THE Pot of Gold people seek at the end of the rainbow is wreathed in mist and never has quite been reached. Very different is the story of those who have investigated the myriad possibilities of Furfural. Just one case where Furfural proves itself a tangible "Pot of Gold" is in it's use as a . . . . . .

SELECTIVE SOLVENT

Furfural

The selective solvent applications of this aldehyde are based largely on the fact that in a series of compounds the solubility in Furfural in creases with higher degrees of unsaturation.



In the case of petroleum, Furfural extracts unsaturated sludge-forming entities. In refining wood rosin, Furfural has gained distinction by extracting the color bodies which heretofore caused large quantities of material to be without a ready market. Recent work indicates that Furfural offers possibilities in separating drying and non-drying fractions of vegetable and animal oils.

TYPICAL PROPERTIES:

Boiling point	157–167°C. (99%)
Specific gravity (20°C.)	1.161
Flash point (open cup)	56°C.
Freezing point	—36.5°C.
Color	Straw yellow to amber

Other major uses are as a resin reactant, wetting agent, preservative, general solvent, and impregnating agent.

Colorado and the Nineteenth Colloid Symposium

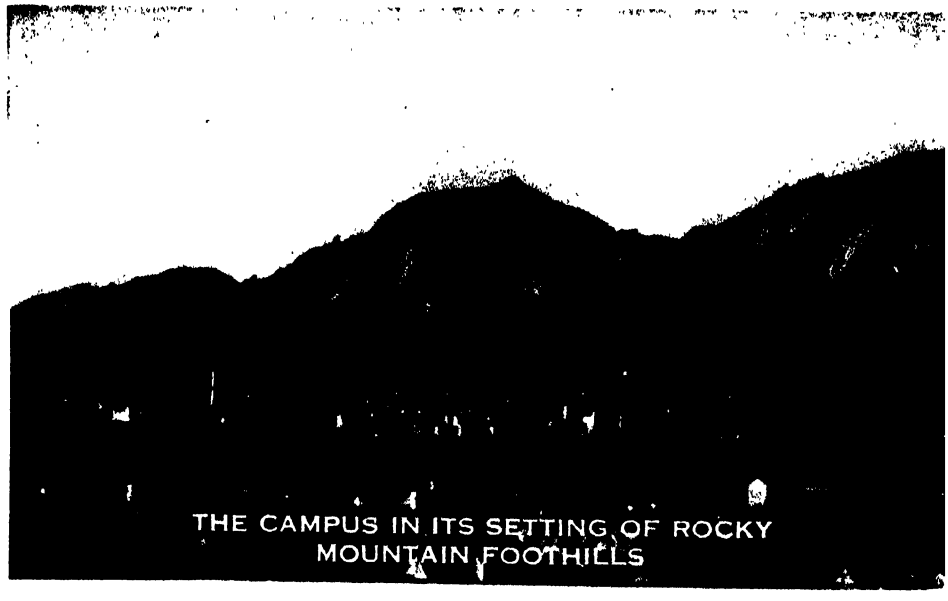
Boulder, Colo., June 18 to 20, 1942

For symposium program—see May 25 issue, page 684

CHEMISTS from all parts of the Nation will register on June 18 for the Nineteenth Colloid Symposium in the West Lounge of the Memorial Building on the campus of the University of Colorado in Boulder. This is the first meeting of the group in the Rocky Mountain region, and it comes at a peculiarly opportune time. The eyes of both East and West are turned there, whether it be for education, industry, or recreation. In spite of threats of gas rationing and fears of a falling off of tourists, Estes Park reports a greater advance reservation of accommodations than last year. Vacationists are planning to stay all summer, and instead of gas rationing being a detriment it may actually be a blessing, since the tourist will have more time for relaxation and fishing than he would have with plenty of gasoline.

The Federal Government has long recognized the strategic importance of Denver, which possibly has more federal bureaus and offices than any city outside of Washington, but it remained for the present war to emphasize the need for locating more of our vital industries in this region. Climatic considerations were responsible for the development of the Fitzsimmons General Hospital in Denver after World War I. With its recent extensive additions it is now the largest building in Colorado and the largest government hospital in the United States. The Lowry Air Field and Training School for Aerial Photography is being increased in importance by the recent location in its immediate vicinity of the Buckley Air Field and Training School for Bombers. Remington Arms recently completed a large plant at a cost of over $10,000,000 and a huge munitions depot is being built in the southern part of the state. Last summer an ambitious young engineer in Denver conceived the idea of putting Colorado's vast machine industry to work on a ship building program. As a consequence, today all subcontract work for the Mare Island Navy Yard is being cared for in Denver. Ships are literally being built in the Rocky Mountains in huge sections and sent on flat cars to the West Coast for rapid assembly. One concern has turned its entire effort toward the making of Army tanks for the British Government. All of this activity has forced the Colorado Fuel and Iron Co., greatly to expand its plant at Pueblo. A large Army camp is being established near Colorado Springs, and final approval has just been given in Washington for the location of a $75,000,000 Chemical Warfare Plant and Arsenal. The Gates Rubber Co. is devoting its entire attention to defense contracts, with the result that its business is on the increase rather than decrease owing to a rubber shortage. The Coors Pottery, makers of fine chemical laboratory porcelain, is located at Golden 10 miles west of Denver, and the Denver Fire Clay, Mine and Smelter Supply Co., Hendrie and Bolthoff Mfg. and Supply Co., and the Stearns Rogers Mfg. Co. are only a few of the many splendid chemical, chemical engineering, and mining supply concerns located in Denver.

Boulder County was the center of the tungsten mining industry during World War I and is again taking its place as a foremost producer of tungsten ores. The Wolf Tongue Mining Co. in Boulder is the leading producer of tungsten in the State. The county also produces large quantities of high-grade fluorspar, the best properties being operated by the Boulder Mill of the General Chemical Co. of New York, N. Y. Colorado still remains a large producer of gold and silver, Boulder County producing about $1,250,000 worth of gold in 1940.



The power requirements for this large and ever-increasing industry are cared for by the State's vast reservoir of bituminous coal, estimated to be sufficient to last the entire Nation for over 300 years.

In 1919 a bill was passed by Congress permitting the city of Boulder to buy out of the Roosevelt National Forest 3,965 acres of land including the famous Arapahoe Glacier, so that Boulder now enjoys the distinction of being the only city in America, if not in the world, that owns a living glacier from which its water supply is obtained. The water is so pure that it needs no filtering or chemical treatment. Except for pedagogical reasons, it could be used in most analytical chemical processes in the laboratory without distillation. The Continental Divide is visible from Boulder and many of the Nation's highest peaks can be seen from here. Fifty Colorado peaks—more than half of the 80 highest in all North America—are 14,000 feet or more. The State has 583 other peaks of more than 12,000 feet in altitude.

The University of Colorado provides Boulder with its largest single pay roll. The regular attendance is in the neighborhood of 4,000 students. For many years the summer school has operated on the basis of giving a full quarter's work, divided in two equal sessions. The attendance for the two sessions usually runs over 4,000, made up of students from all parts of the Nation, seeking a combination of education and recreation. During the summer the university maintains a camp at an altitude of 9,500 feet, 28 miles from Boulder to fulfill both educational and recreational functions. The Science Lodge serves as laboratory, classroom, and library for field classes in geology, botany, and zoology. Weekly drives over Trail Ridge Road, highest continuous automobile highway in the United States, and in the Rocky Mountain National Park are scheduled by the Recreation Department. The department also sponsors frequent longer and shorter hikes and steak fries. A half hour's walk from the campus, and one is in the mountains; a half hour's drive from the campus in Boulder Canyon is Boulder Falls; an easy hour's drive and one is in Estes Park; in another hour, one is on the Continental Divide, over the Trail Ridge Road.

For those desiring other forms of entertainment, public lectures, movies, plays, play readings, orchestra recitals, art exhibits, etc., are available on the campus in

THE CAMPUS IN ITS SETTING OF ROCKY MOUNTAIN FOOTHILLS

Resins designed FOR WAR JOBS

YOU haven't time to test hundreds of resins now. But how else can you be sure you have the best resins for important war jobs?

That's where our consulting service comes in. Our knowledge of resin chemistry is available to help you pick the right resins.

We design resins to fit specifications supplied by industry. We have many resins already designed that meet many of industry's requirements. Just to give you an idea:

There are the three Pentalyns*—pale, hard, heat-stable; Lewisol moleics; Imperial Brand Ester Gums; Hercolyn* and Abalyn*, liquid methyl esters of rosin; ester gums from Staybelite* (Hercules Hydrogenated Rosin); and Vinsol* Ester Gum, dark, hard, high-melting, and solvent-resistant. The new Poly-pale Ester Gum is high-melting and has heavier body than gum esters.

But that's not all we have, and it gives no suggestion of the interesting possibilities in some new Hercules resins.

Let's get together and talk definitely about the characteristics you would like to have in a resin. Every minute saved now helps toward victory.

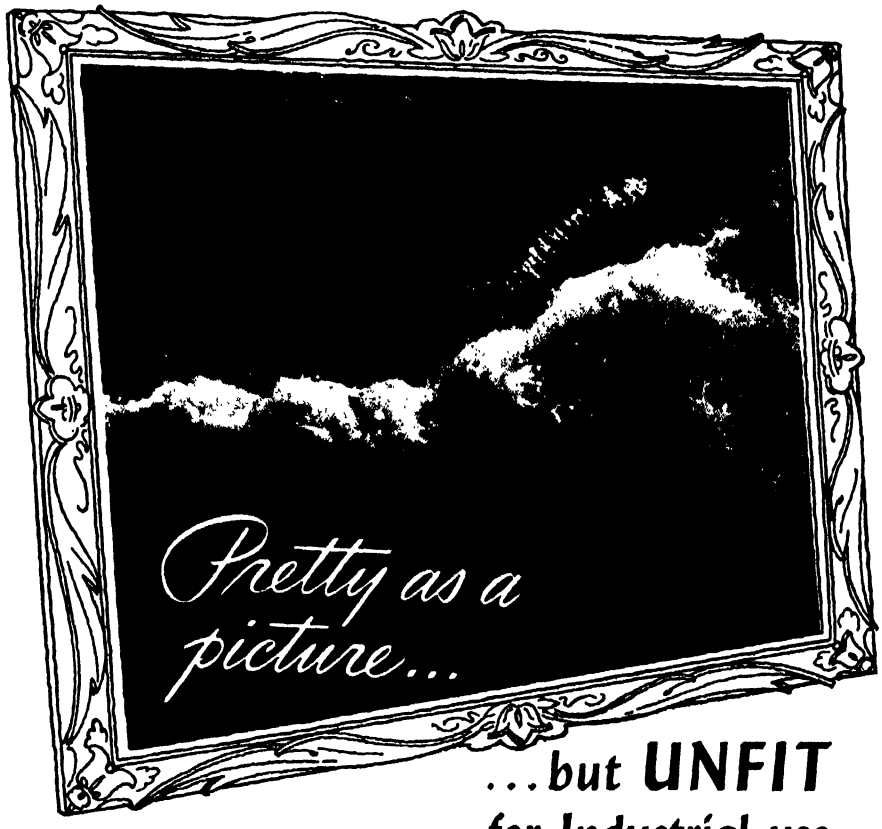
A. O. A. C. Cancels Meeting

BECAUSE of war emergency work, the annual meeting of the Association of Official Agricultural Chemists has been cancelled, according to an announcement of the Association's Executive Committee. The meeting was originally scheduled for October 27 to 29. A. O. A. C. mailing address is P. O. Box 540, Benjamin Franklin Station, Washington, D. C.

THE national production of salt in 1941 rose 23 per cent or 2,350,669 short tons over 1940, the U. S. Bureau of Mines has announced.



Industrial Research Institute Holds Annual Meeting

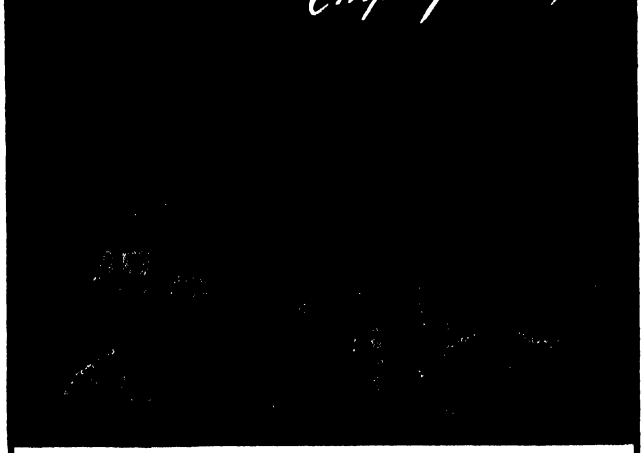
THAT the 2,300 industrial research laboratories in this country provide an invaluable reservoir of ideas, organized scientific knowledge, and special facilities for the solution of the many new technical problems growing out of the war effort was given particular emphasis at the fourth annual meeting of the Industrial Research Institute in Cleveland, Ohio, May 22 and 23. Over 50 industrial executives and research directors participated in round-table discussions which dealt chiefly with the adjustment of research programs and personnel to meet war conditions.

Guest speakers at a dinner session Friday evening were George Crile, eminent Cleveland surgeon, and his associates, Otto Glasser and D. P. Quiring. They described their researches into the nature of the living cell, which have been carried on for the past 10 years under the auspices of the Cleveland Clinic Foundation. Inspection visits to the new Thompson Aircraft Products Co. plant at Euclid, Ohio, and the General Electric Institute, Nela Park, occupied the members and their guests Friday afternoon.

H. S. Benson, United Shoe Machinery Corp., Beverly, Mass., was elected chairman, and Wm. R. Hainsworth, Servel, Inc., New York, vice chairman, of the institute's executive committee for the ensuing year. Two new members of the committee were also elected for three-year terms—Philip W. Pillsbury and Harold K. Work.

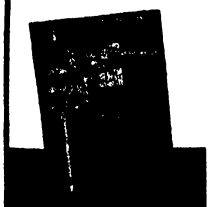
The Industrial Research Institute, an affiliate of the National Research Council, undertakes to promote improvement of methods and more economical and effective management in industry and research through the cooperative efforts of its members. The membership is composed of 45 industrial concerns maintaining research laboratories. Their top executives in charge of research represent them in the activities of the institute, which has headquarters at 8 South Michigan Ave., in Chicago. Other members of the executive committee are F. W. Blair, Caryl P. Haskins, Maurice Holland, and R. C. Newton.

...but UNFIT for Industrial use



WATER as it occurs in nature may be sparkling and clear—it may even be pure enough to drink—but without conditioning, it is rarely suitable for either power or processing needs.

Betz is an organization of engineers and chemists trained and skilled in detecting and correcting all qualities of water that might limit its usage for any particular water application. Betz service includes Consultation, Plant Studies, Plant Design and Service Supervision for Boiler Water, Process Water, Municipal Water, Waste and Sewage Disposal.



Now, as never before, with industry under the necessity of attaining the utmost in production with available plant and personnel, the matter of correct water conditioning becomes of primary importance. In this vital field Betz stands ready to render a complete service—of consultation, research, design and supervision.

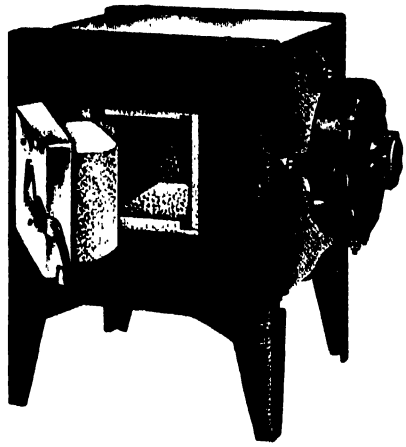
IT COMES CLEAN and COOL



Barnstead Distilled Water

For out and out efficiency, you can't beat Barnstead Water Stills. In addition to producing a chemically and bacteriologically pure distillate, Barnstead Stills deliver the distillate at reasonably low temperatures. In fact, Barnstead Water Stills, in sizes from 5 gallons per hour up, have a special auxiliary cooling device which cools the final distillate to within 20° higher than your tap water, without affecting the still's efficiency or adding to its operating costs.

When you want the most modern water still—one with automatic operation, easy cleaning facilities, and most efficient types of heating elements—specify a Barnstead. Sizes from 1/2 to 500 gallons. Operation by gas, steam or electricity.

NEW STOP TIMER

We offer this instrument to the laboratory as superior to any of the electric timing devices heretofore available. It has the following features:

1. A dial face almost twice as large as the usual timers previously obtainable (5½" in diameter).

2. Perfected frictionless device gives instantaneous start and dead stop without coasting. Current makes and breaks with stop and start of movement thus preventing current flow when in stop position without operation of secondary line switch.

3. Graduated in ⅕ seconds with each full second interval ¼" long thus making 1/4 or 1/10 second, split seconds easily estimated over these large subdivisions.

4. Large red hand indicates seconds and split seconds for 60 seconds per sweep and smaller black hand for minutes, thus giving reading range up to 3600 seconds for a single revolution of the small hand.

5. Fine instrumentation and accuracy; set in heavy handsome, lacquered metal case; total weight 3¼ lbs.; plug and 4 ft. flexible wire.

6. Exceptionally low price of about one-third of that usually paid for this type of timer.

GR-1000 **ELECTRIC STOP TIMER** With 60 second dial; for 110 volts, 60 cycle current.

Price.....$13.50 each

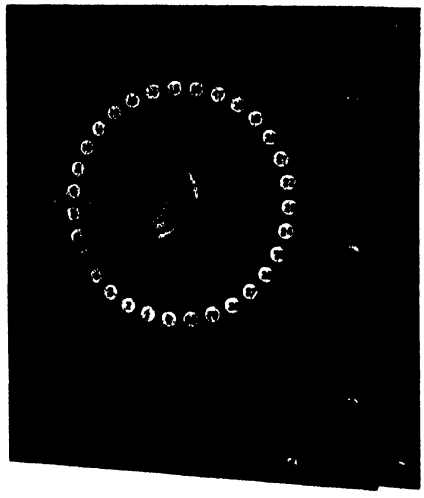
Iota Sigma Pi Cancels Convention Plans



IOTA SIGMA PI, honorary society for women chemists, has just completed its 42nd year and has voted to cancel plans for the national convention in view of present world conditions. The 21 active and alumnae chapters, located in accredited colleges in various sectors of the United States, have elected the following national officers for the next triennium: president, Evelyn Laing McBain, Chemistry Department, Stanford University; vice president, Nellie Naylor, Chemistry Department, Iowa State College; secretary, Marjorie Crawford, professor of chemistry, Vassar College; treasurer, Elisabeth Koch, University of Chicago; editor, Hazel A. Fehlmann, Department of Home Economics, University of Colorado; historian, Agnes Fay Morgan, Department of Home Economics, University of California.

Through the voluntary efforts of Laverra Hill and the national officers, the society has been actively engaged in mobilizing women chemists from the ranks of active and alumnae members, who number several thousand, to aid in meeting the current emergency and professional needs.

Richard N. Armstrong has become associated with the Tool Steel Division of the Jessop Steel Co., Washington, Penna.

TEMPERATURE READINGS

from 6 to 30 locations

with a **SINGLE INDICATOR** *!*

THE ENGELHARD ROTARY SWITCH

can multiply the utility of your indicating pyrometers by permitting temperature readings from 6 to 30 locations to be made with a *single indicator*. Lead wires from the thermocouples at each point are brought to the Rotary Switch and operation is as simple as turning the handle, which permits a reading from any one point.

If readings are made on a double scale indicator, the Engelhard Rotary Switch can be built to accommodate rare and base metal couples.

The Engelhard Rotary Switch is a real economy on both furnace and kiln installations or wherever multiple point temperature readings are required.

Send for complete details!

Save Till It Hurts

IF THE present world struggle is to terminate successfully, if the forces of right are to triumph, and if Democracy is to survive, we must all save till it hurts. This saving program applies not only to strategic materials, to our national resources of raw materials, and to our liquid assets, but to our time. Time, effectively utilized, is the factor which will determine the outcome of the present struggle.

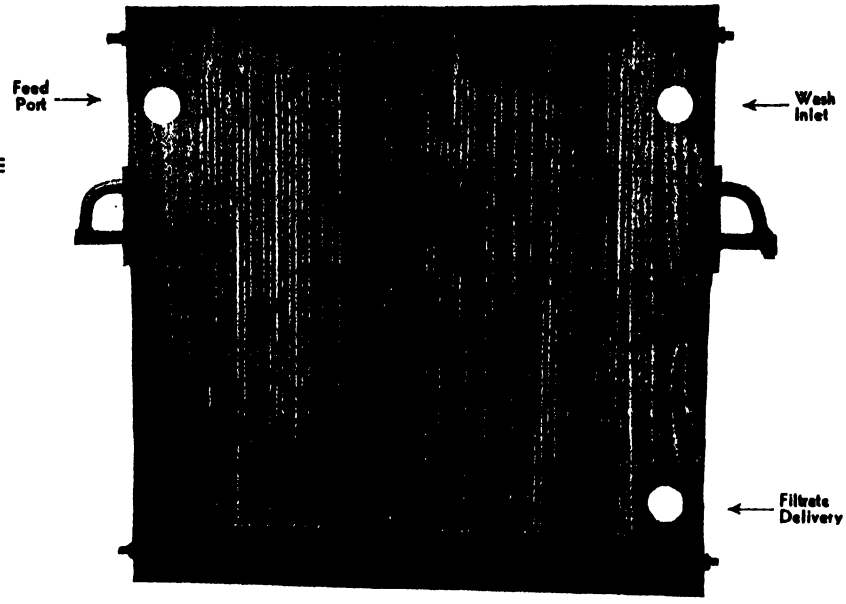
Do you realize that the preparation of a good test in chemistry costs a minimum of about $5.00, and that by the time it has been typed, edited, mimeographed, and distributed to students approximately $5.00 or more has been added to the cost of the test?

Do you understand that you may obtain valid tests in general chemistry, qualitative analysis, and organic chemistry from the Cooperative Test Service, 15 Amsterdam Ave., New York, N. Y., and that you may obtain 27 topic examinations in organic chemistry from the chairman of the Organic Test Committee, Ed. F. Degering, Purdue University, Lafayette, Ind.? Do you know that these tests may be obtained at a nominal price, and that the energy you normally spend in the preparation of such tests may be directed toward the program of winning the war?

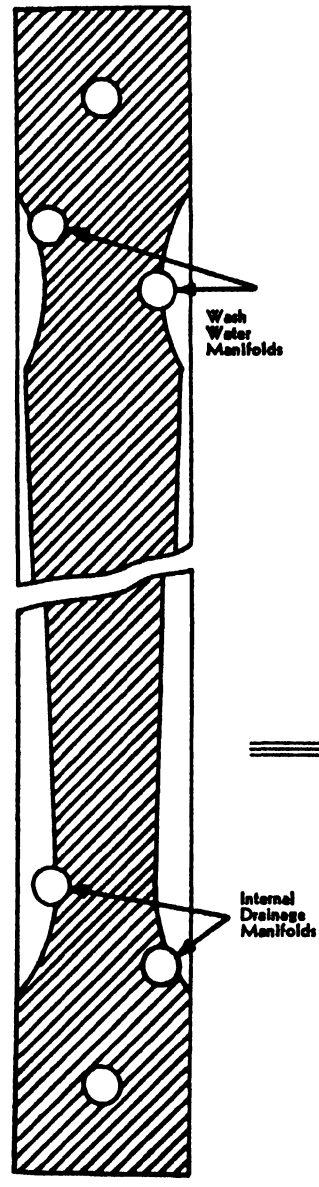
Do you realize that the topic examinations in organic chemistry will be accompanied by validity data, so that you may select the more valid items and thus adapt your test to a 5-, 10-, 15-, or 20-minute quiz?

If you have used these tests, you will use them again. If you have not used them, this is an opportune time to keep your morale high by avoiding the tedious task of preparing and grading tests of your own making.

Swift Sponsors Fellowship in Nutrition



A NEW approach to the study of nutritionally valuable protein and of carotene as provitamin A will be made at the University of California at Berkeley by Agnes Fay Morgan and Lillian Bentley under a Swift & Co. Fellowship in Nutrition awarded to the university. It is of considerable importance to determine how usable the provitamin A, which is found in fruits and vegetables, may be in the human body under the varying conditions of the usual American diets. If low protein diets so affect the liver and other mechanisms that carotene cannot be adequately transformed into vitamin A, some adjustment of low meat, low egg, low milk, and low income diets should be made. Since animal vitamin A is poorly represented in such diets, inadequate utilization of the vegetable carotene in its place may be a serious factor in producing malnutrition.



TAPERED

DRAINAGE CHANNELS TO GIVE EXTRA CAPACITY

STAGGERED

DRAINAGE MANIFOLDS TO GIVE EXTRA STRENGTH

F-M FREEFLOW FILTER PLATE*

THE ever-increasing depth of the channels in the F-M FREEFLOW Filter Plate* takes care of the progressive inflow of filtrate through the cloth without it backing up. This means extra capacity over that of ordinary plates.

Staggered drainage manifolds mean that the section through the plate at that particular point has not been weakened by the borings. This means a longer lasting plate.

Both features suggest that the F-M FREEFLOW Filter Plate is the better buy. Why not try one and find out for yourself? In writing, give full details of your problem in addition to size of plate desired. There are several different materials of construction and we would like to know the solution being filtered before making recommendations.

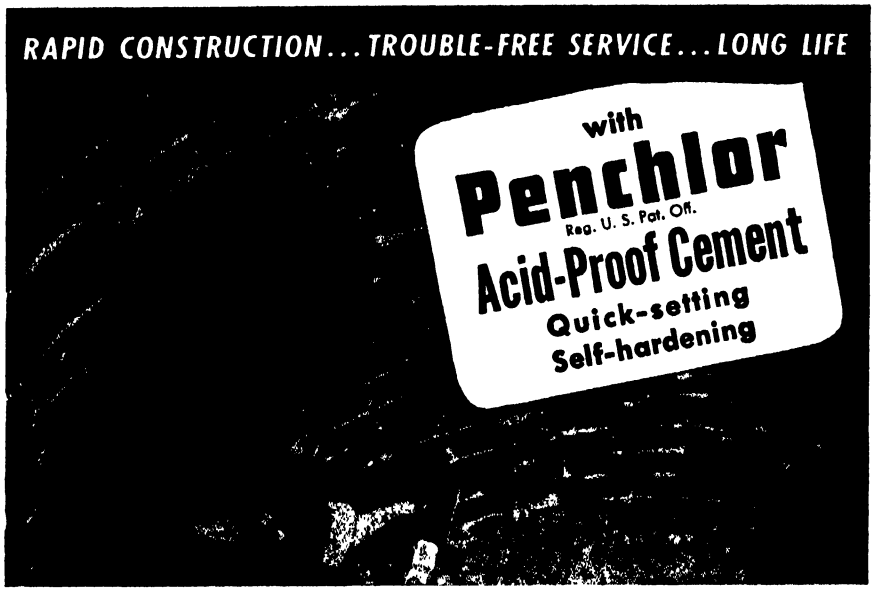
What Is This?

Editor, Chemical and Engineering News:



ABOUT 25 years ago, I purchased some laboratory apparatus from a laboratory that was discontinuing. Among the articles delivered was a curious apparatus, the use of which I have never been able to discover, though I have questioned numerous representatives of laboratory supply houses, visiting chemists, and others.

The apparatus was displayed at an exhibition in the University of Minnesota, carrying a tag marked "What is this?" It consists of a cast iron bowl with a small opening at the top, supported by a tripod to which are attached three iron bars hinged at the bottom to the legs of the tripod and held at the upper ends by concealed springs which allow about 0.125-inch motion when pressed toward the central tubular support. This support is threaded into the base tripod and the under part of the upper bowl. The whole apparatus is painted or enameled blue-black. The bowl holds water and I have used it as a vase.

If anyone can suggest a possible use for this apparatus I would be very grateful.

PENCHLOR ACID-PROOF CEMENT is used to make the mortar with which these acid-proof bricks are being laid in lining a tank to store hot dilute sulphuric acid at the chemical by-products plant of the Chesapeake-Camp Corp., Franklin, Va. Construction Contractors: A. Lynn Thomas Co., Inc., Richmond, Va.

Here is another installation where *Penchlor Acid-Proof Cement* will prove its worth in years of dependable service. This quick-setting sodium silicate cement was chosen because of its proven record of highly satisfactory service under severe acid conditions . . . a record that includes successful application in most of the important chemical plants throughout the United States, in steel mills, in paper and pulp mills, oil refineries and smelting plants.

With time a vital factor in new construction, the quick-setting and self-hardening qualities of Penchlor Acid-Proof Cement are a greater advantage than ever. There need be no delays in putting brick-lined equipment into service.

If your conditions require a corrosion-proof cement with unusual strength and exceptional resistance to abrasion, use one of our resin cements, such as *Asplit* for conditions which are always acid—or *Causplit* for conditions alternately acid and alkaline. You will find these easy to handle and capable of withstanding a wide range of corrosive conditions at temperatures up to 350 degrees F.

Long experience in our own chemical plants in handling acids and alkalis makes it possible for us to put seasoned engineering service at your disposal—without obligation, of course. Write us fully. Or if you prefer, use the coupon below.

Auto, Plane, and Oil Industries Research Organization

AUTOMOBILES, airplanes, tractors, and other vehicles of the future may operate better because of the work of a new organization which will coordinate the research activities of the automotive, aeronautic, and petroleum industries.

The best combinations of fuels, lubricants, and equipment powered by internal combustion engines will be sought by the new group, the Cooperative Research Council. The council, which is sponsored by the American Petroleum Institute and the Society of Automotive Engineers, will continue the work of the Cooperative Fuel Research Committee. The committee has done effective research on fuel utilization for 21 years, and its work has been of major importance in the development of automobile and airplane engines and fuels to their present state of perfection.

Other council groups which will centralize, correlate, and promote cooperative research within these industries include a cooperative lubricants research committee, a cooperative equipment research committee, and a war advisory committee.

Material Scarcities of Chemical and Drug Manufacturers

A STUDY of material scarcities of chemical and drug manufacturers, based upon the recently completed Dun & Bradstreet Survey for 1941, shows that the pinch of material scarcities was intense for manufacturers of paint, varnishes, and colors, but slight for manufacturers of drugs, cosmetics, and insecticides. The scarce materials used by mixers of paints, varnishes, and colors are mostly lead, zinc, aluminum, cobalt, tin, steel, manganese, chromium, and graphite. For makers of drugs, cosmetics, and insecticides, the short items are tin, zinc, cork, plastics, rubber, aluminum, chemicals, mercury, and magnesium, some of which are predominantly packing materials.

Shortages serious enough to restrict production fell hardest on middle-sized concerns with $200,000 to $300,000 annual sales, where 11 out of 16 companies had to curtail or stop civilian production of one or more items, and on the very large concerns where 43 per cent of the companies had to cut production.

SOME THINGS NEED NOT BE RATIONED

IN THIS WAR of total resources, many things must be rationed. There must be priorities on men, machines and materials.

You are feeling the effects of this, and we are, too.

But there are some things which need not be rationed, on which, indeed, there is a greater demand than ever before.

At Michigan Alkali we do not intend, ever, to ration service to our customers. Our experience and our technical service men are at your call — as near as your telephone — ready to help you with your problems.

And, like service, research continues at Michigan Alkali, with no reduction in time or enthusiasm. We are working round the clock learning, exploring, *producing.*

We are at your service — and in our country's service, too.

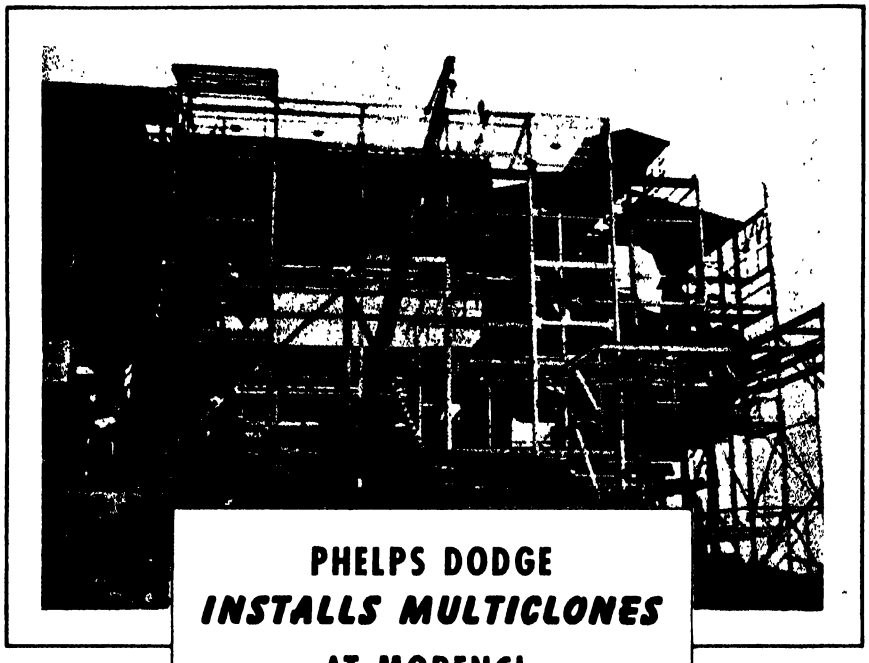
A Practice Treatise on Manufacture of Soda and Ammonia Process. *Te-Pang Hou.* 2nd ed. 570 pages. Reinhold Publishing Corp., 330 West 42nd St., New York, N. Y., 1942. Price, $9.50.

THE publication of this thoroughly revised and enlarged second edition of T. P. Hou's book is fortunate at this critical period in the history of chemical trade.

Dr. Hou was the first engineer to build soda and ammonia works in China, and this at a time when the ammonia process was developing very rapidly and information regarding it was kept from the public. The first works located at Tangku near Tientsin was captured in July 1934 by the Japanese. The synthetic ammonia plant, consisting of four chemical plants near Nanking, was built under Dr. Hou's personal supervision, and he was one of the last to leave it.

His book was revised under very difficult circumstances and completed after he arrived in the United States, where he has been working for his government. In reading the book, one is impressed both by his knowledge of the detail of alkali manufacture and by chemical science.

The history of the development of the Solvay Process Co. and the different plants is accurate and complete. The chapters on rock salt, sea salt, and the brine wells with purification of brine are now up to date. The burning of limestone, description of the kilns used, and the thermal calculations are very interesting, and suggestions of details of the operation to give good control are valuable.



One of the most important parts of the operation which saturates the brine with ammonia is the control of the loss of the very valuable material which is always watching for a way to escape. The exact proportion of gas to brine is very important, as well as loss from the exit of the distillers. The recovery of the ammonia from waste gases by washing with the new brine is well covered.

When the plant at Syracuse was built in 1882, the machinery, developed by Ernest Solvay in Belgium, was very crude. The carbonating columns were showered with water on the outside to keep them cool, and had a capacity of 10 kilo tons of soda ash per day. A suggestion by Mr. Cogswell led to the introduction of internal cooling tubes, with better design as new ones were added, until the same column had a capacity of 60 tons per day. The tank filters, which required much labor to shovel the bicarbonate of soda, were replaced by rotary filters, which have been copied all over the world. As each new element was added, other improvements were introduced.

Dr. Hou has fully described this improved apparatus and the phase rule in the column reaction. These reactions effect the production of good quality crystals, and the subsequent operation of filtering and calcination to soda ash.

The need for ammonia led to the building of the first by-product coke ovens, which in turn resulted in the establishment of plants to use by-products. Dr. Hou has described this, stressing the position of the ammonia soda industry in this critical war

RESEARCH

EVEN Pollyanna might have difficulty in finding a ray of sunshine in the situation in which many manufacturers have been placed because of present shortages of many materials. Nevertheless the resulting frenzied search for substitutes has often uncovered a hitherto overlooked product which has proven satisfactory or even superior to that formerly used.

Unfortunately, however, it has quite often been found that a new discovery is available in only limited amounts since the producer had not previously received sufficient encouragement to warrant installation of the equipment necessary for large-scale production. Even in such cases the research has not been in vain since with the return of normal conditions the producer will be able to supply the product in adequate amounts, the value of it having been established, and the user will have been awakened to the necessity of investigating all materials which he might use.

There is often a temptation to consider a particular product of manufacture as being entirely satisfactory as regards both quality and cost and to curtail research involving it. Because of present shortages of raw materials and equipment there is also a temptation to curtail research involving new products or new uses for present products.

Chas. Pfizer & Co., Inc. does not subscribe to such views. We believe that when the job now in hand is successfully completed our nation will find itself with a productive capacity greatly in excess of any that it has previously enjoyed and that now is the time to prepare to utilize this. We are increasing our research program, primarily of course in order to help do our share toward finishing this present job as quickly as possible, but also secondarily that new products and new uses for old products may be available for any surplus productive capacity to come.

Beyond the Flyleaf

CONTINUED FROM PAGE 760

time, and the development at Syracuse of the synthetic ammonia plant which the TVA had failed to develop.

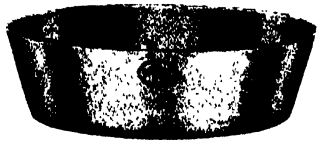
Pure bicarbonate of soda with caustic soda and their by-products are fully treated, as well as electrolytic caustic plant. The methods of control and operation, chemical analysis, and tests in the alkali industry are exceptionally complete and will be a great help to the operators. The chapters on layout and pumps, the tables and charts, and a complete index will be very useful.

Such a book would have been a great help to the reviewer during the 50 years of development of the industry, in which he had engineering responsibility. The process is not perfect; there are more improvements to be made, and the new Chinese plant will make some of them.

EDWARD N. TRUMP

Specifications for Coke-Oven Light Oil Distillates

A TABLE of standard specifications for coke-oven light oil distillates has been issued by the Crowley Tar Products Co., 271 Madison Ave., New York, N. Y., in chart form.



The Engineering Profession. *Theodore Jesse Hoover* and *John Charles Lounsbury Fish.* 1st ed. 441 pages, 29 figures, 42 tables. Stanford University Press, Stanford University, Calif., 1941. Price, $5.00.

THE authors have carried out excellently their objectives of providing a "vocational guide to the young man matching his capacities against the requirements of various professions" and of sketching for the experienced engineer a broad picture of the engineering domain.

The opening chapters discuss: Who is an engineer? What is engineering? What are the fields and functions of engineering? The next five chapters cover civil, mining, mechanical, and electrical engineering, and chemical engineering and other fields, in a manner that should prove very helpful to the young man choosing his profession. The logical pattern of treatment includes examples of engineering activities in each discipline, subfields, functions, sources and conditions of employment, curricula, outstanding engineering accomplishments, lists of typical problems, professional societies, and selected bibliographies. There follows a group of six chapters on the method of engineering, application of the engineering method, uncertainties in engineering, vocational guidance, education, and the new call to the engineering profession. Three appendixes list definitions of engineering, requirements for admission to membership in professional societies, and engineering titles.

The large number of specific examples in all sections of this book will aid prospective engineers in forming a concrete idea of their future duties and responsibilities. Chemical engineers will regret that their field did not receive fuller treatment.

PLATINUM FLOUR ASHING DISH—ACTUAL SIZE—ABOUT 12 G.—FIG. 68 OUR CAT. N17

Thorpe's Dictionary of Applied Chemistry. Volume V. Fehling's Solution to Glass. *J. F. Thorpe* and *M. A. Whiteley.* 4th ed. 610 pages. Longmans, Green and Co., New York, N. Y., 1941. Price, $25.

VOLUME V is the continuation of Volumes, I, II, III, and IV [NEWS ED., 15, 421 (1937); 17, 579 (1939); 18, 907 (1940)], the quality of the work being fully maintained. This dictionary of applied chemistry has been known to practically every chemist alive today, usually from the time of graduation, it having gone through three previous editions and having been for decades a stand-by of the chemical profession. It has been used as a standard encyclopedic work for reference ever since the first volume was produced under the authorship of Jocelyn F. Thorpe, later

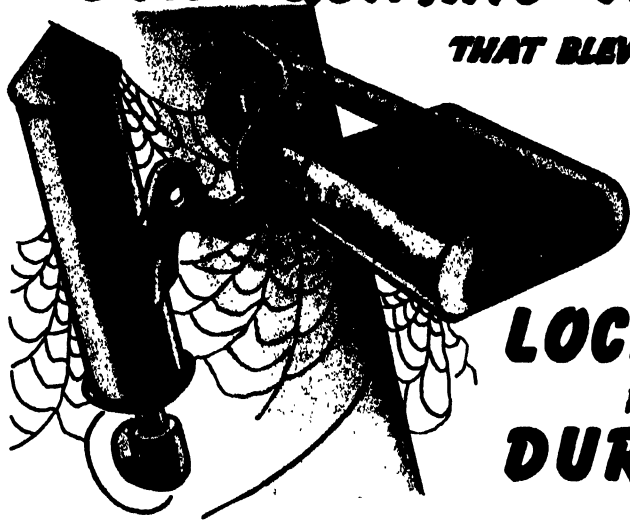
knighted for his accomplishments, who died on June 10, 1940, and to whose memory this work is perhaps his greatest monument.

Volume V, like its predecessors, is arranged alphabetically by subject, each being treated as occasion warrants by England's leading chemical experts. The more lengthy articles are on Fermentation (50 pages), Fertilizers (25 pages), Fibres (71 pages), Finishing of Fabrics (20 pages), Fireproofing (16 pages), Fluorine (12 pages), Food Preservation and Preservatives (20 pages), Fuel (47 pages), Coal Gas (50 pages), and Glass (52 pages). It should be available to all chemists as a reference work, since it will bring them more closely in touch with the present status of applied chemistry and with its literature. The work is invaluable.

CHARLES L. PARSONS

LONGMANS, GREEN AND CO., 55 Fifth Ave., New York, N. Y., have published a 19-page abridged index to Volumes I to V of the new edition of Thorpe's Dictionary of Applied Chemistry. This index is available at $1.00.

The Physical Examination of Metals. Volume II. Electrical Methods. *Bruce Chalmers* and *A. G. Quarrell.* 280 pages. Longmans, Green and Co., New York, N. Y., 1941. Price, $6.00.



THIS little volume first appeared in London about a year ago. It is of the introductory type. No attempt is made to present an exhaustive study of one or the other of the many topics included: methods for determining and correlating magnetic qualities; resistivity; thermoelectric effects; x-ray diffraction patterns; and finally, the interpretation of the details revealed by the electron microscope, the most recent and probably most important electrical instrument for the examination of metals.

Magnetic and induction methods (the descriptive text for which covers about one quarter of the volume) are used in detecting flaws in metals; likewise for the determination of thickness of electroplate, and for the study of hardening qualities of steel cables.

If the reader feels that a disproportionate section of the volume is devoted to "magnetic qualities of metals", it is well to recall the relatively recent, revolutionary discovery and rapid commercial development of the tungsten-free magnetic alloys of the alnico type. There is every indication that hereafter the metallurgical research laboratories will devote more time and study to the magnetic qualities of new alloys.

More than 100 illustrations supplement the text. These are practically all line drawings, but as such are more enlightening than photographs of apparatus show-

The old "QUITTING" WHISTLE THAT BLEW AT 5....

LOCKED UP FOR THE DURATION

Yes, Sir! We are proud to report to you, our customers, and future customers, that we were one of the first companies in America to quit quitting work at 5. We have forgotten that a clock exists—so busy are we working day and night trying to do our share turning out equipment to be used by the Process Industries in winning the war.

Rotary Vacuum Degreaser

MANUFACTURER OF CHEMICAL PROCESS EQUIPMENT

Our foremen and workmen — artisans all — have worked successfully with all the generally used metals and alloys including: Aluminum, Copper, Everdur, Lead, Monel, Nickel, Inconel, Steel, Stainless Steel, Clad Steels, and Hastelloy. We have qualified processes — A.S.M.E., National Board Standard, and Hartford Steam Boiler — for the welding of unfired pressure vessels and miniature boilers.

DESIGNERS OF CHEMICAL PROCESS EQUIPMENT

We have specialized in the design of distillation equipment as well as heat transfer, evaporation, and fluid flow apparatus for the Chemical Process Industries. We are prepared to design equipment for your needs or to work with your engineers on a confidential basis.

ing pretty housings underneath which important wiring diagrams are concealed.

Disappointing is the very little space (less than a page) devoted to photoelectric effects in metals.

COLIN G. FINK

Tin Solders. *S. J. Nightingale*, revised by *O. F. Hudson*. 2nd ed. 118 pages. British Non-Ferrous Metals Research Association, Euston Street, London, N. W. 1, England, 1942. Price, $2.75 postpaid.

THE need for economy in tin makes it necessary to consider where and how composition of tin solders can be modified. Changes must be based on a sound knowledge of existing tin solders and their properties. With this objective the first edition of "Tin Solders" has been thoroughly revised to include investigations carried out in the past 10 years. New sections have been added on creep properties of solders and soldered joints.

A. S. T. M. Emergency Specifications Prepared

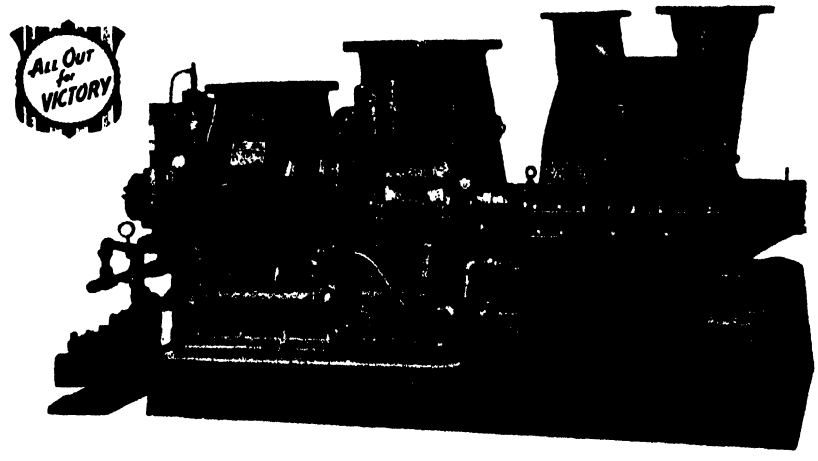
SINCE the procedure was established late in 1941 by the American Society for Testing Materials for preparing emergency provisions and complete emergency specifications or tests, a number of actions have been developed to expedite procurement and conserve critical or strategic materials during the emergency. The following committees have taken action: A-1 on steel, A-5 on corrosion of iron and steel, A-10 on iron-chromium-nickel alloys, B-1 on copper wires for electrical conductors, B-2 on nonferrous metals and alloys, B-5 on copper and copper alloys, B-6 on die-cast metals and alloys, D-1 on paint, varnish, and lacquer, D-11 on rubber products, and D-12 on soaps and other detergents.

Sixteen Vitamins and Deficiency Diseases

THE recently published 63-page Vitamin Edition of the *Bulletin of the Lederle Laboratories* discusses the fat-soluble factors, vitamins A, D, E, K, and essential fatty acids, and the water-soluble factors identified with the B complex, ascorbic acid (C), and P, as well as the several unknown factors.

A table gives daily allowances for specific nutrients recommended by the Committee on Foods and Nutrition of the National Research Council with minimal daily requirements proposed by the Federal Food and Drug Administration. A 2-page general summary and more than

Three "R-C" Positive Displacement Blowers used for sludge aeration. Combined capacities 5,400 CFM, against 6 lbs. pressure.



THE TASK OF
Superior Performance

National survival calls for the CREAM of industrial equipment to shoulder the burden of production.

"Superior performance" has long been a characteristic of Roots-Connersville Air and Gas Handling Equipment, based on sound engineering and built-in ruggedness that keeps them dependable and efficient—even under today's non-stop, peak-plus production requirements.

Since National survival comes FIRST, the co-operation of our customers is earnestly requested when their orders cannot be handled as promptly as in normal times.

ROOTS-CONNERSVILLE BLOWER CORP.
206 Georgia Avenue Connersville, Indiana

Roots-Connersville 3-stage Centrifugal Blower driven from low pressure steam turbine. Capacity 4,560 CFM, 6 lbs. gauge pressure. Installed in Eastern chemical plant.

seven pages of literature references are grouped according to the specific vitamins treated in the text.

The bulletin is available only to physicians and research workers in the vitamin field on request to the Lederle Laboratories, 30 Rockefeller Plaza, New York.

Nutrition Report

THE report of the Proceedings of the National Nutrition Conference for Defense, called by President Roosevelt in Washington, May 26 to 28, 1941, has come off the press. Sponsored by the Federal Security Agency Office of the Director of Defense Health and Welfare Services, the report is available from the Superintendent of Documents, Washington, D. C., for 35 cents.

Carbohydrate Nomenclature

THE Committee on Carbohydrate Nomenclature, appointed by the Divisions of Sugar Chemistry and Technology, Chemical Education, and Biological Chemistry of the AMERICAN CHEMICAL SOCIETY, has prepared its third progress report, which will be sent to all persons who request copies. Requests should be sent to the secretary, Horace S. Isbell, National Bureau of Standards, Washington, D. C., or to other members of the committee.

War on the Home Front

AN 8-page pamphlet, presenting the basic facts that everyone should know about poison gas, bombs, and incendiaries, has been prepared by Joel H. Hildebrand of the University of California and made available by the Commonwealth Club of California, San Francisco, Calif., at 10 cents a copy. It is based on an address before the club on March 6, 1942, and tells in plain language to ordinary

For twenty-five years Schaffer Poidometers have all been built with that hidden ingredient—QUALITY. They are all sturdy, reliable and long-lasting. For proportioning raw and finished materials, it will pay you to install Schaffer Poidometers.

GOOD EQUIPMENT DESERVES GOOD CARE

To the vast number of Poidometer users we bring this message: It will more than pay you to keep your machines up to the pink of condition. Check every part of your Schaffer Poidometer. Any part that shows wear or needs replacing should be ordered now. Your Poidometer will serve you best if you keep it in top condition.

citizens facts that everyone should know and principles of action that should be followed.

Electrical Terms

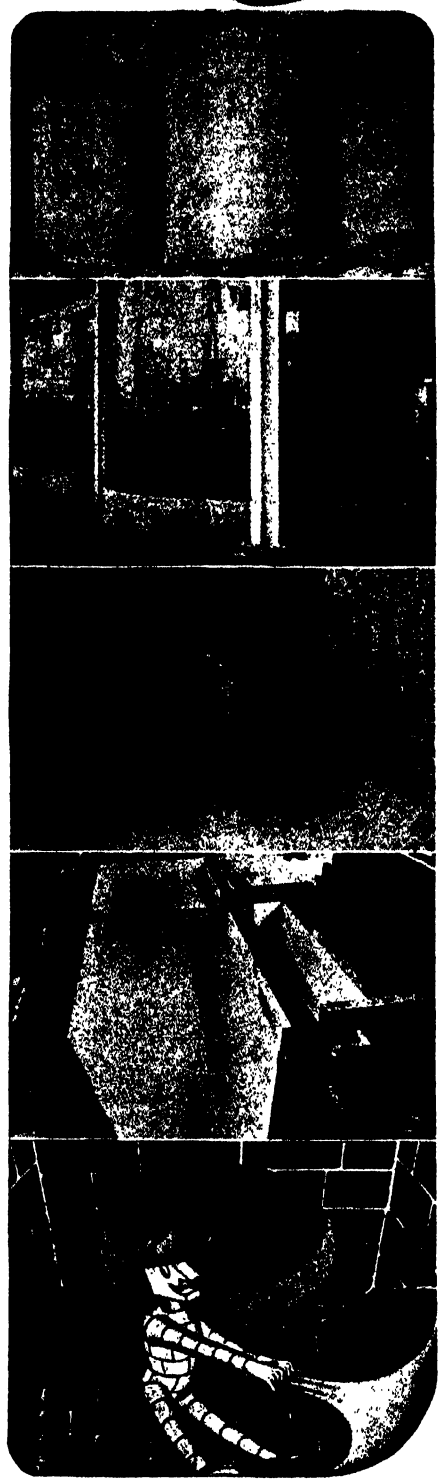
FOR the first time American definitions and notes of all important electrical terms have been combined in one volume, known as "Definitions of Electrical Terms, C42". The glossary is the result of 12 years' work by more than 300 persons, including representatives of technical, trade, and government groups. This 300-page, indexed volume may be obtained for $1.00 a copy from American Institute of Electrical Engineers Headquarters, 33 West 39th St., New York, N. Y.

Synthetic Rubber Plant

THE charter of the Neches Butane Products Co. has been filed in the office of the Secretary of State, after being held for several days pending investigation whether operation would be in violation of Texas antitrust laws. The stockholders of the company, which is to make synthetic rubber from butadiene, are the Gulf Oil Corp., Atlantic Refining Co., Socony-Vacuum Oil Co., Texas Co., and Pure Oil Co.

Stock ownership has been apportioned because the raw materials will be supplied from the companies' refineries in the area, and they will furnish the trained personnel necessary for operation.

Butadiene from Ethyl Alcohol



TODAY, when ethyl alcohol is proposed as a source of butadiene, needed in vast quantities for the production of synthetic rubber, it is interesting to note that Vladimir N. Ipatieff, director of chemical research, Universal Oil Products Co., and a professor of chemistry at Northwestern University, was the first to establish formation of butadiene from ethyl alcohol in a single-stage operation.

However, Professor Ipatieff carried this work, which was done in Russia in 1903, only as far as the laboratory stage, being interested primarily in other objectives at the time. Later workers have made further important discoveries in this field and have developed efficient processes to produce this vital chemical in huge volume economically from alcohol. These processes are now being offered to American refiners.

Edward A. Prill, instructor in chemistry at South Dakota State College, resigned his position to join the Research Staff of the Borden Laboratories of Bainbridge, N. Y.

AS OF April 9, 1942, the corporate name of the Ethyl Gasoline Corp., 405 Lexington Ave., New York, N. Y., has been changed to Ethyl Corporation.

STEBBINS Quality LININGS & TILE TANKS

. . . . provide process plants wherever acids, alkalies, corrosive or non-corrosive liquids, gases or vapors are encountered, with an efficient, economical, long-lived and trouble-free installation.

Where sludges, brines, bleaching solutions, process water, pulps, dust, salts, granular products, etc., are to be stored, the new STEBBINS tile tank can be installed without waiting.

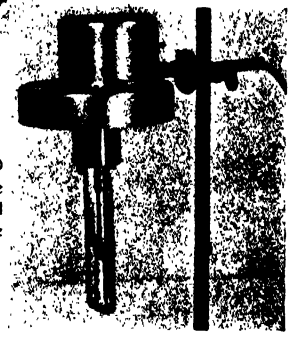
Fifty-eight years' experience in meeting specific operating conditions in a great many process plants has provided STEBBINS with one ingredient that is vital today—KNOWLEDGE.

To know how to do a first-class job—saves TIME. Ask STEBBINS when you have a lining or tank problem.

SEMCO

Stebbins Engineering and Manufacturing Company

365 EASTERN BLVD. WATERTOWN, NEW YORK



MAKE VISCOSITY TESTS AT POINT OF PROCESS

with a

Brookfield Synchro-lectric VISCOSIMETER

VARIABLE SPEED UNIT Four speed changes regulated by finger-controlled lever.

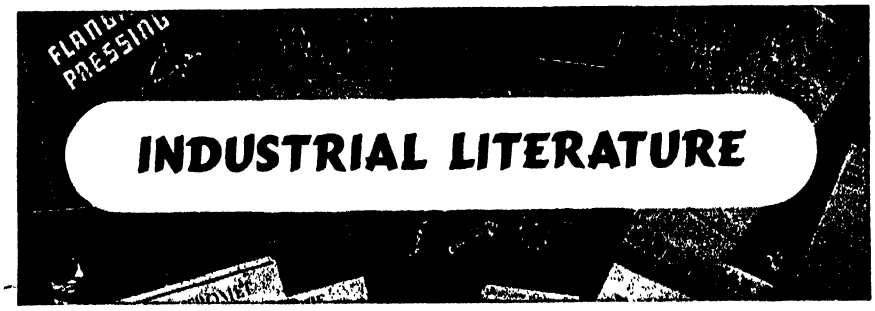
SINGLE SPEED UNIT for use where speed variations are not required.

***SAVE* valuable production time** and insure closer control on defense orders by running viscosity tests direct in plant containers where your material is being processed.

***NOTE* these advantages:** Continuous or intermittent indicating—Simple, sturdy, easy to operate and clean—Permanently standardized, no adjustments.

Operator can easily convert any model to either portable or stationary use as desired.

The Synchro-lectric Viscosimeter operates anywhere in *plant* or *laboratory*. It will test solutions in suspension and of any degree of opacity, and is not affected by temperatures to 600°F. Just a few seconds are required to complete the reading which requires no technical skill. The instrument is permanently standardized, requires no adjustments. Viscosities are indicated in *centipoises* in wide ranges on a large, easily read dial. Accuracy is within one percent of full scale based on Bureau of Standards values.



Variable speed units provide a means for measuring materials of plastic flow at different rates of shear.

Standard units operate on 60 cycle, 110 volt current but can be equipped for other frequencies and voltages.

Full information with recommendations will be sent on request.

BROOKFIELD ENGINEERING LABORATORIES

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Automatic Lubrication. A 4-page illustrated folder describes a single pipe centralized system that is said to lubricate all connected bearings without employing any springs, diaphragms, packing, or exposed moving parts. *Bulletin 423 CEN.* TRABON ENGINEERING CORP., Cleveland, Ohio.

Caulking Compounds. Developed originally to seal openings in ducts carrying electrical conductors, the caulking compound described in this 4-page bulletin has found many uses. It is said to stick to any clean surface without slumping, flowing, or hardening in service. *Form E1-19A CEN.* JOHNS-MANVILLE, 22 East 40th St., New York, N. Y.

Chloramine-B. This 11-page mimeographed bulletin is devoted to the properties and uses of Chloramine-B (sodium *N*-chlorobenzenesulfonamide). The oxidizing, bleaching, and germicidal properties of this compound suggest many important uses in the industrial field. *Memorandum on Chloramine-B CEN.* THE SOLVAY PROCESS Co., 40 Rector St., New York, N. Y.

Conical Mills. This 28-page illustrated booklet gives data on the construction, operation, and application of conical mills. *Bulletin 13-D CEN.* HARDINGE CO., INC., York, Penna.

Efficient Steam Production and Consumption. This 8-page bulletin is devoted to increasing the efficiency of power and process steam systems through the use of adequate measurements and control. A schematic diagram illustrates the application of meters and control for such a steam plant. *How to Safely Stretch Steaming Capacity Bulletin 5 CEN.* BAILEY METER Co., 1070 Ivanhoe Road, Cleveland, Ohio.

Electrical Resistance Materials. A 4-page folder discusses negative temperature coefficient resistance materials and their industrial applications. The electrical resistance of these materials decreases with rising temperature. *Negative Temperature Coefficient Resistance Material Folder CEN.* KEYSTONE CARBON CO., INC., Saint Marys, Penna.

Elevator-Conveyors. This 32-page illustrated catalog covers conveyor equipment and the handling of many materials. Equipment arrangements for the handling of 10 different materials are shown. *Book 2075 CEN.* LINK-BELT Co., 307 North Michigan Ave., Chicago, Ill.

Filter Papers. A 16-page booklet describes this manufacturer's various grades of filter paper. *Whatman Filter Papers Booklet CEN.* H. REEVE ANGEL & CO., 7-11 Spruce St., New York, N. Y.

Gas Engines. An 8-page bulletin gives information on heavy-duty, stationary type, four-cycle gas engines of 175 and 210 horsepower. *Bulletin S-550-B20 CEN.* WORTHINGTON PUMP AND MACHINERY CORP., Harrison, N. J.

Graphite Lubrication. This data sheet discusses a colloidal natural graphite suspension in lube oil that may be added to many types of lubricants. Addition of this material to lubricants is said to reduce frictional wear of machine parts. *Bulletin 4 CEN.* NATIONAL GRAPHITE CO., INC., 17 John St., New York, N. Y.

Hydraulic Jacks. Three types of hydraulic jacks are covered in this 4-page bulletin. These are the independent-pump type, the vertical and horizontal outside-pump types. Operating data are given for the various units. *Bulletin 710-A CEN.* WATSON-STILLMAN CO., Roselle, N. J.

Iron and Steel Pipe and Tubular Products. This 62-page catalog details information on wrought iron pipe and tubular products, welded steel pipe and tubular products, and wrought iron hot rolled products. *General Catalog CEN.* A. M. BYERS CO., Pittsburgh, Penna.

Laboratory Ovens. This 4-page folder describes forced draft insulated laboratory ovens primarily designed for analytical work. These ovens, available in 48 models with temperature range up to 1250° F., are said to be ideal for test baking and drying of various industrial finishes and for sterilizing. *Bulletin 105 CEN.* DESPATCH OVEN CO., Minneapolis, Minn.

Liquid Flow Control. A 4-page folder covers an automatic flow control unit designed to handle predetermined quantities of liquids. The quantity desired is set on the dial of the instrument. *Gottfried Automatic Flow Control Folder CEN.* BAKER PERKINS, Saginaw, Mich.

Lubricating and Fuel Oil Purifiers. A 4-page bulletin describes a supercentrifuge unit for the removal of dirt, grit, carbon, sludge, and water from oil. *Sharples En Bloc Oil Purifier CEN.* SHARPLES CORP., 2300 Westmoreland St., Philadelphia, Penna.

Manufacturer's Products. Designed to assist new men in industry, this 4-page folder offers a convenient listing of products made by this manufacturer. *To Help You Win the War of Production Folder CEN.* S. F. Bowser & Co., Fort Wayne, Ind.

Mixers. This 8-page bulletin describes bowl type mixers using the planetary principle. These mixers, available with variable speed, are equipped with interchangeable agitators and portable bowls ranging in size from 10 to 85 gallons. *Flexibility in Mixing Operations with Glen Mixers Bulletin CEN.* American Machine & Foundry Co., 511 Fifth Ave., New York, N. Y.

Modern Precision. A 16-page illustrated publication contains news of L. & N. instruments, controls, and heat-treating methods and their applications. It supplements regular catalogs and bulletins of the company. Vol. 2, No. 1, spring, 1942, has just appeared. *Publication CEN.* Leeds & Northrup Co., 4934 Stenton Ave., Philadelphia, Penna.

Ozone Water Purification. These two bulletins discuss sterilization of drinking water through the use of ozone. The equipment described is said to handle up to 9,000 gallons of water per hour. *Model "A" and "B" Water Purification Units Bulletins CEN.* Technicraft Engineering Co., 5610 South Soto St., Los Angeles, Calif.

Pickling of Iron and Steel. This 12-page booklet describes the use of this manufacturer's acid addition agent, which is said to promote faster pickling, reduce attack upon steel, and save acid. *Modern Pickling of Iron and Steel Booklet CEN.* Enthone Co., 442 Elm St., New Haven, Conn.

Pressure Vessel Pressings and Forgings. This 32-page catalog covers welded necks, manhole necks, nozzles and covers, handhole rings and fittings, and similar forgings and pressings. *Catalog 8-42 CEN.* Lenape Hydraulic Pressing & Forging Co., P. O. Box 536, West Chester, Penna.

Priorities. A 16-page book for salesmen and jobbers explains priorities and how to use them. *Booklet CEN.* Manning, Maxwell & Moore, Bridgeport, Conn.

Pumping Control. An 8-page bulletin describes electric-operated control as employed in pumping applications. Controllers of the recording and indicating type are shown, together with specimen chart records and installation photos. The text is largely devoted to waterworks and sewage engineering but also covers pumping applications. *Bulletin B-294 CEN.* Foxboro Co., Foxboro, Mass.

Radiant Kiln Firing. A factual report on direct radiant kiln firing in various branches of the ceramic industry, reprinted from an address before the American Ceramic Society, Materials and Equipment Division, is given in a mimeographed bulletin, well illustrated. *Bulletin CEN.* The Selas Co., Philadelphia, Penna.

Steam Jet Ejectors. A 32-page booklet gives data on ejectors ranging from 1 to 5 stages. A section is devoted to factors affecting ejector selection. A number of installations are shown by photographs. *Bulletin G-7 CEN.* Elliott Co., Jeannette, Penna.

Thermometers. Three single-sheet bulletins describe new and improved yellow back thermometers. Information on calibrations and uses is given. *Eureka Yellow Back Thermometer Data Sheets CEN.* Nurnberg Thermometer Co., Inc., 236 A Broadway, Cambridge, Mass.

Valves. A 32-page bulletin describes quick-operating valves for blow-off, water columns, and other boiler room services. It is profusely illustrated, with complete tables of specifications, dimensions, and prices. *Bulletin E-100-CEN.* Everlasting Valve Co., 49 Fisk St., Jersey City, N. J.

Welded Steel Plate Construction. This 288-page handbook covers storage tanks, pressure vessels, smokestacks, brewery equipment, bolts, pipes, and tubes. Request should be made on company letterhead. *Buffalo Handbook CEN.* Buffalo Tank Corp., Dunellen, N. J.

Welding. An 18-page bulletin entitled "The Fleet-Fillet Welding Technique for Speeding War Production" is planned as a ready reference for plant production officials. *Bulletin 432 CEN.* The Lincoln Electric Co., Cleveland, Ohio.

The Quaker Chemical Products Corp., Conshohocken, Penna., has established new and larger warehouse and blending plant facilities at 9243 Baltimore Ave., Chicago, Ill. R. L. Phillips is plant manager and members of the technical service staff are K. B. Copeland and C. O. Judd.

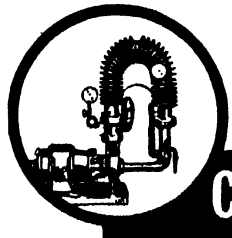
Zircon, Rutile, and Ilmenite

Zircon, rutile, and ilmenite supplied by Orefraction, Inc., 7511 Meade St., Pittsburgh, Penna., are said to be of exceptional purity with practically no contamination, owing to the exclusive methods of separating, refining, and beneficiating the raw concentrates. This is particularly true of the zircon in connection with new developments in ceramics and of the rutile as a coating for welding rods. Rutile and zircon can be supplied in grain form or ground to customer's exact specifications. Ilmenite is available only in grain form.

The company specializes in the separation and concentration of minerals and ores. It devotes its efforts largely to the problem of separating ores which are difficult to separate by ordinary means and to the removal of objectionable impurities from commercial ores.

Protection from Mold

More than 75,000,000 pounds of butter will be wrapped in specially impregnated parchment paper during the current year to protect them from losses due to mold, reports the Du Pont Food Research Laboratory. The baking industry also is attacking the mold problem in baked goods by incorporating mold retardants in increasing quantities of bread, pies, and cakes. It is estimated that nearly 2,000,000,000 loaves of bread will be protected this year.



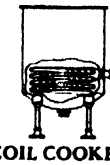
A Simple Statement of What the COCHRANE-BECKER SYSTEM of High Pressure Condensate Returns is Accomplishing in Chemical Process Work

Condensate is removed from process equipment, with automatic and continuous separation and removal of entrapped air and condensate is returned to boiler at high temperature and high pressure.

THE RESULT IS

1. **FASTER HEAT** — Quicker Starting Up — Brings Batch to a Boil More Quickly
2. **HIGHER TEMPERATURE** . . . . . From Steam Pressure Available (or Safe to Use)
3. **MORE UNIFORM HEATING** . . . . Higher Quality • Greater Production • Standardized Batch Timing
4. **LOWER MAINTENANCE** . . . . . Of Traps • Reduced Cleaning Time • Less Need for Cleaning or Dressing Drums, Knives, etc.

+ **LOWER FUEL COST** . . . and Increased Boiler Capacity due to High Pressure Return.



Write for a copy of Publication 3025, or let us make a survey of what a C-B System can do in your plant

Completed On Time!

"Never have so many, owed so much, to so few!"

That brilliant statement made by Britain's Winston Churchill can be applied to a case in our own country.

Today, millions of soldiers, sailors and marines are being supplied with an abundance of safe water from Layne built Well Water Systems. The Armed Forces can thank less than two thousand Layne Organization employees. In an amazingly short period of time, they undertook—and *completed on time*—the most gigantic Well Water System building task ever accomplished in this, or in any other country. These widely experienced men located water bearing sands, drilled wells in almost every type of earth formation and set tons of casing. Furthermore they built the pumps, made installations and placed their water systems in operation—producing hundreds of millions of gallons of water daily.

Such outstanding service, performed without delay or failure, has created a brilliant chapter in the long and successful career of the Layne Organization. No greater commendation for ability, speed and efficiency could be offered.

United Carbon Co.	540,028	522,111	1.36	1.31
Vulcan Detinning Co.	148,879	135,066	3.89	3.47
	Twelve Months' Earnings			
Chemical Fund (assets)	7,852,061	7,556,426	8.69	7.54
Jones & Laughlin Steel Corp.	.....	14,606,194	...	9.55
Koppers Co.	4,233,518	6,138,974	3.03	4.94
Pennsylvania Salt Mfg. Co.	1,689,379	1,622,128	11.26	10.81

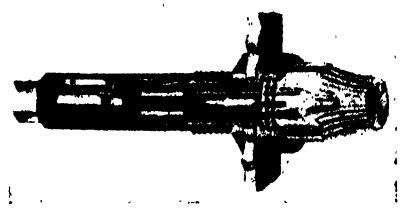
For six months ending February 28, 1942, **Canadian Industrial Alcohol Co.** and subsidiaries report net profit of $264,673, equal to 23 cents a share on combined Class A and B stock compared with $179,488 or 16 cents a share for the six months ended February 28, 1941.

Although sales and earnings, before provision for income taxes, of the American companies of the **Monsanto Chemical Co.** in the first quarter of 1942 were the highest in history, if the tax recommendations of the Secretary of the Treasury are adopted the amount available for common stock will be the lowest since 1933 and the return on invested capital will be the lowest percentage since 1926. Net sales rose 14 per cent to $16,439,014, and net income was $4,385,364 before provision for income taxes.

Chas. Pfizer & Co., Inc., established in 1849, has completed plans for the first public financing in its history. Ownership heretofore has been confined to employees. The program calls for recapitalization of the company and the sale of more than $5,000,000 of new common stock. Out of the proceeds the company plans to retire all bank debt and preferred stock, to add more than $1,000,000 to working capital and to purchase and retire the old common stock holdings of the estate of Emile Pfizer, son of the founder of the company. A registration statement covering 240,000 shares of common stock is to be filed with the SEC.

The 1941 report of the **Standard Oil Co. of New Jersey** shows consolidated net income of $140,572,419 after taxes, etc., including deduction of $30,000,000 for losses on foreign investments, equal to $5.15 on common. This compares with net income of $123,886,346 or $4.54 in 1940. The prospects for 1942 were said to be not good.

For the year ended December 31, 1941, the **Imperial Chemical Industries, Ltd.**, shows net income of £6,162,212 after depreciation and obsolescence, income taxes, national defense contributions, and excess profits tax. Income in 1940 was £6,418,533.



The **U. S. Rubber Reclaiming Co., Inc.**, for the year ended December 31, 1941, shows net profit of $207,601, compared with $319,710 for the preceding year.

Wood Construction Growing in Northwest

The Timber Engineering Co., Inc., Washington, D. C., has opened a branch office in Portland, Ore. Establishment of the office has been occasioned by increased building of war projects which has brought a growing demand from engineers and architects for technical information.

The new branch is to assist distributors and timber fabricators in the Northwest in their promotion of timber construction, render technical advisory service, maintain additional stocks of Teco products readily at hand, cooperate with the West Coast Lumbermen's Association and the Western Pine Association in lumber promotion activities, and do educational work with engineering students and practicing engineers.

Circuit-Break Indicator

The Littelfuse indicator, panel mounting No. 1414, a product of Littelfuse, Inc., Chicago, Ill., is a light that goes on only when the circuit is broken. When installed at any point in connection with remote motor control, it works instantly, with a plainly visible signal to show on or off. It is applicable to any circuits, circuit breakers, line switches, etc.

Air Raid Instruction In Fire and Gas Defense

DURING the present emergency, when it has been necessary to organize and conduct courses in fire and gas defense for air raid wardens, auxiliary firemen and policemen, industrial groups, and other organizations, the city of Minneapolis, Minn., has worked out a very successful procedure.

A corps of 150 to 175 instructors was organized, largely from men who held advanced degrees in chemistry or closely allied sciences, who were reached through the university, the industrial chemists, science teachers in local high schools, and the city fire department. Three meetings were held to furnish the instructors with detailed knowledge on the materials they were to discuss, including suggested lecture demonstrations.

The instructors were furnished with mimeographed copies of six sample lectures—gas defense, chemical agents, first aid in case of exposure, fire defense, bombs, and extinguishing fires. Each instructor was also furnished with a set of large posters and a wooden model of the standard 1-kg. incendiary bomb to be shown in class, and was given a list of reading material.

A limited number of mimeographed copies of the lectures are available on loan to authorized civilian defense instructors through D. F. Defenbacher, Chief of Training, Office of Civilian Defense, Minneapolis, Minn. Richard T. Arnold and Edgar E. Hardy, School of Chemistry, University of Minnesota, Minneapolis, Minn., have been very active in this work.

Artificial Fog

Nozzle jets for creating fire-fighting fog are molded of shatterproof plastic Tenite, made by the Tennessee Eastman Corp. They may be used on any standard pipe or shut-off nozzle. The jets are molded by Northern Industrial Chemical Co. and Niagara Insul-Bake Specialty Co., Inc., and sold by Mul-T-Jet Nozzle Corp., 11 West 42nd St., New York, N. Y.

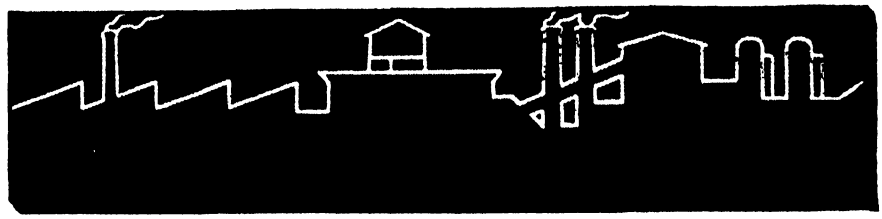
WITH
HOMO-MIXER'S
ADVANCED PRINCIPLE



INDUSTRY must win the race against time! But more than a great time-saver is the Eppenbach HOMO-MIXER. It's also engineered for finer diffusion.

Its principle is wholly different. There is no vortex, no air to affect the mixture. Only a fraction of the mass is worked at one time, creating more uniform dispersion. The material is rapidly forced up from the air-free bottom by the stationary turbine fins. With tremendous pressure and turbulence, the flow surges upward, outward and down. The entire batch completes this cycle in just a minute or two. No clamping to tank, no setting at angle, no vibration.

HOMO-MIXERS are doing a big job in process plants today—batteries up to a hundred! Write us!

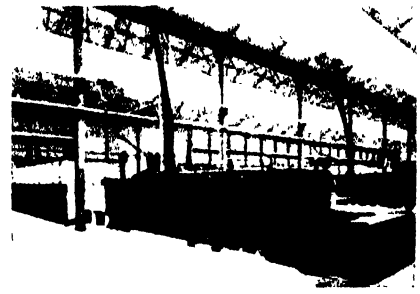
Name of R. & H. Chemicals Department Changed

THE change in name to Electrochemicals Department for one of the manufacturing units most basic in the production of chemicals for peace and wartime uses has been announced by E. I. du Pont de Nemours & Co., Inc., Wilmington, Del. This group of activities was originally known as the R. & H. Chemicals Department. The change is effective June 1. The original name arose after the acquisition by du Pont in 1930 of the Roessler and Hasslacher Chemical Co.

Plastic Cases for Compasses

COMPASSES with cases molded of Lucite methyl methacrylate resin are replacing depleted supplies of French compasses, particularly in high school and college physics laboratories. The plastic cover is molded into a magnifying lens on small compasses so that dial figures may be read easily. Lucite replaces the brass case and glass lens of French compasses and provides top and side visibility. The compasses are made by Chicago Molded Products Corp. from Lucite produced by the Plastics Department of the du Pont company, and are marketed by Chicago Apparatus Co.

Step-Valve Pump in Transparent Plastics



A PLASTICS pump, in which the step-valve and inlet and discharge connections are made entirely from transparent plastics, is recommended for handling alum solutions, hypochlorites, weak acids, mineral and animal oils, and many other liquids, the Plexiglas valve being unaffected by most inorganic solutions and by alkalies and oxidizing acids only in high concentrations.

The valve is said to be nonclogging, self-cleaning, and to eliminate air-binding. The transparency of the plastics material makes it possible to watch the pump function and to detect discoloration or dirt particles in the liquid as it passes through the valve. The pump is made by Milton Roy Pumps, 1300 East Mermaid Ave., Philadelphia, Penna.

SUPPLIES of nylon racket strings and fishing tackle adequate for a normal 1942 season already are on the shelves of sporting goods dealers, reports the du Pont company.

Annealing and Pickling Shell Cases

A high-pressure spray, continuous automatic pickling plant attached to the discharge end of gas-heated muffle furnace.

THE Hanson-Van Winkle-Munning Co., Matawan, N. J., has been appointed sales representative in the United States for equipment of the automatic type for annealing and pickling brass shell cases. The equipment was developed by Curran Bros., Ltd., Cardiff, Wales, which has built and installed virtually all the shell-processing equipment in England and has recently installed several plants in Canada as well as two in New England.

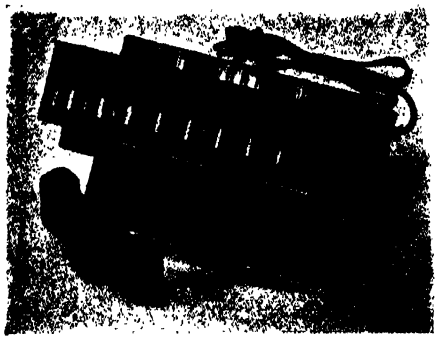
A typical installation includes a pickling chamber placed at the discharge end of a gas-heated muffle furnace so that cold-worked articles can be loaded on conveying mechanism at the mouth of the furnace and need not be touched by hand until they emerge at the other end of the plant, annealed, pickled, washed, and warmed so that they dry very quickly. Pickling chambers are lined with rubber and have a number of zones in each of which the work passes through high-pressure sprays, first of acid and then of hot water, directed upon it from a number of directions from a frame of fine jets.

Ernst Magic Carrier

A NEW Ernst drum and barrel carrier has been announced by the Ernst Magic Carrier Sales Co., Buffalo, N. Y., to handle light wood, fiber, paper barrels, and "one-trip" light gage steel containers with or without chimes. Its capacity is 800 pounds and it will accommodate drums and barrels from 14 to 24 inch diameters.

Plastic Can-Filling Unit

GERMS and condensed moisture can be prevented from entering milk cans while they are being filled in dairies by use of a new can-filling unit with a transparent cover molded of Lucite methyl methacrylate resin, the du Pont company, Wilmington, Del., announces. The plastic cover seals the mouth of the can but allows the dairyman to see the level of the milk without exposing it to the air. Designed to drain any condensed moisture on the feed line to the outside of the can, the unit has a valved feed tube built into the cover to carry the milk directly from the feed



line into the can. The cover is made by Chicago Molded Products Co. from Lucite produced by the Plastics Department of du Pont, and marketed by Majonnier Brothers Co., Chicago.

Fluorophotometer

PFALTZ & BAUER, INC., Empire State Bldg., New York, N. Y., announce a new model fluorophotometer, "C".

This instrument is especially designed to accelerate routine control work in the determination of vitamins and minerals, maintaining established standards of accuracy. It is a complete self-contained unit, incorporating a simple electrical circuit, eliminating the use of amplifier and stabilizer. Features are a novel slide carriage, accommodating both the blank and sample to be tested, and an automatic shutter which shields the sample from the light beam and cuts in the measuring circuit.

Midget Dalite Lamp

WHILE this lamp was designed for use with single Taylor slide comparators when determinations must be made at night or in dark places, it is useful for routine testing even in daylight. The comparator base sits on the shelf at an angle of 45° so that in making readings one can look directly into the slots in the slide and base. This eliminates handling, with possible chance of breakage, as only the sample tubes need be handled. The lamp gives uniform conditions at all times. It is fitted with a Dalite glass, special bulb, cord, and switch and operates on any 110-volt circuit. It can be used with any Taylor pH, chlorine, or phosphate comparator, made by W. A. Taylor & Co., Baltimore, Md.

Hand-Wiping Safety Solvent

THE Research and Development Laboratory of The Curran Corp., Malden, Mass., has developed a new hand-wiping safety solvent which is to be marketed as a safety replacement for naphtha, gasoline, and kerosene in removing cosmoline from rifles issued to troops.

The new solvent is also applicable as a naphtha substitute for grease cleaning and hand-wiping operations in ordnance factories or shell plants.

New Extender Replaces Rubber

EXISTING supplies of rubber can be extended through the use of Extendex C, a new material offered by Wishnick-Tumpeer, Inc., 295 Madison Ave., New York, N. Y. Extendex C can be used to replace from 5 to 20 per cent of the rubber hydro-

"Radio Principle"
Temperature Controller

With . . .

PROVED-IN-SERVICE SUPERIORITY*

Your investment in this Wheelco "Radio Principle" Controller pays you daily dividends in the form of:

(1) Product Uniformity
(2) Reduced Spoilage
(3) Increased Production

Capacitrols have often paid for themselves during a single production cycle.

The famous "Radio Principle" control employed in Wheelco Controllers eliminates the faults inherent in all other types of controllers. Only Wheelco Controllers can give you instantaneous control combined with extreme accuracy of temperature measurement.

Write *for Bulletin D2-3 giving detailed description of this controller.*

EMPLOYMENT CLEARING HOUSE

BUFFALO, NEW YORK

SEPTEMBER 7–11, 1942

▼ ▼ ▼ ▼

ST. LOUIS, April 1941 — 1200 interviews

ATLANTIC CITY, September 1941 — 1000 interviews

MEMPHIS, April 1942 — 1700 interviews

BUFFALO, September 1942 — ?

A service maintained for and limited to members and paid student affiliates of the American Chemical Society.

Since personal conference between employer and prospective employee is its main objective, the Clearing House will be open only to those registered at the Buffalo meeting.

Prospective candidates for employment are urged to register in advance. Forms will be available July 1. Write to

* Nominal.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

PACIFIC COAST college has an instructorship or assistant professorship for a man with physical and analytical training. Ph.D. preferred. Genuine interest in teaching, and in the aims of Christian education in a liberal arts college demanded. Give full details of training and experience, and state minimum acceptable salary.
Box 80-T-5, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIPS available for next year. Salary $540 for nine months' service. Part time laboratory teaching. Write for application blanks. H. D. Newton, Head, Department of Chemistry, University of Connecticut, Storrs, Connecticut.

CHEMIST WANTED: Recent graduate or graduate with a few years of experience, development work. Draft deferred. Chicago area.
Box 32-NP-5, Ind. & Eng. Chem., Easton, Pa.

TWO RECENT graduate chemists for analytical analysis in control laboratory of large Philadelphia chemical plant. Salary $2,150, per year.
Box 59-NP-5, Ind. & Eng. Chem., Easton, Pa.

LARGE NEW YORK engineering firm requires chemical engineers age preferably 25-30 with any following experience: 1. Petroleum refinery experience in operation or design of stabilisers, absorbers and light end equipment. 2. Refinery experience in design or operation of plants for solvent dewaxing and solvent extraction of lube oils. 3. Refinery experience in design or operation thermal or catalytic cracking plants. In reply state education, qualifications and refinery experience in detail. Also salary expected and status regarding military service.
Box 80-NP-5, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST, experienced in compounding rubber, wanted for research on sealing materials used for hermetic closures. Good opportunity for young, aggressive, well qualified chemist. Middlewestern location. In reply give full particulars of training and experience, draft status, and salary desired.
Box 50-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL engineer age 27-30 experienced in development and field application of cutting oils, and compounds also wax products by large oil company; location Milwaukee, Wisconsin. Permanent position. Give complete details, education, experience, salary expected, and photograph.
Box 52-T-5, Ind. & Eng. Chem., Easton, Pa.

GRADUATE RESEARCH assistantships, chemistry, University of Florida, commencing July 1st. Stipend $50.00 per month. 14 hours assisting per week from September through May. Fee of $21.25 per semester. For applicaton blank address Dr. J. E. Hawkins, Department of Chemistry, Gainesville, Florida.

DESIGNERS and DRAFTSMEN

For vital war plant work carrying high priority ratings of A-1-A to A-1-C.

Working 50 hours per week with remuneration on basis of a 40-hour week with time and one-half for work in excess of 40 hours per week. Program covers 1½ years.

Must have experience in design of:

Oil Refinery Process Piping
Concrete and Structural Steel
Heat Exchangers, Pressure Vessels
Electrical Control, Light and Power
Conduit Systems

Instrument Engineers able to select and specify proper control instruments for oil refinery units.

Application should be made by letter giving age, nationality, concise outline of previous experience and educational background, present salary, salary desired and references. Include recent photograph.

BLAW-KNOX COMPANY
Process Industries Dept.
P. O. Box 5087
East Liberty Station, Pittsburgh, Pa.

CHEMIST WANTED: Preferably experienced in foods as associate in laboratory specialising in food products in New York metropolitan area. Good opportunity for one with initiative and ability to make contacts. Liberal pay for one who can produce results. Write giving full information and photograph.
Box 16-N-6, Ind. & Eng. Chem., Easton, Pa.

WANTED: Well trained young chemist, Ph.D., for work largely in analysis and standardisation of new drugs. Salary commensurate with qualifications. Give details of education, experience, references, etc.
Box 21-NP-6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, draftsman, experienced in Ethyl Alcohol plant work, to assist in laying out plans and in erecting new plant. Later to continue in production supervision. Write full details and submit photograph.
Box 25-N-6, Ind. & Eng. Chem., Easton, Pa.

Sales and Technical Engineer

U. S. Citizen, for sales and engineering development of stainless steels, clad steels and composite steels. In reply state qualifications and salary desired.

Box 22-NP-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Gentile, with some experience in commercial analytical laboratory and in teaching elementary physics or chemistry, for position with long established institution and commercial food laboratory. State age, experience, draft classification, salary and business references. If possible attach photo or snapshot.
Box 18-N-6, Ind. & Eng. Chem., Easton, Pa.

YOUNG WOMAN, chemical engineer or organic chemist wanted for technical abstracting, translation, and report writing in petroleum industry Chicago area. Must be single, American, preferably under 30. Enclose statement of education, experience, salary requirement, and photo.
Box 23-N-6, Ind. & Eng. Chem., Easton, Pa.

TEACHING POSITION for chemical engineer in rapidly growing department in state university. An unusual opportunity for man of ability and training who likes teaching. Permanent position starting September 1. Kindly give academic history and draft status.
Box 24-N-6, Ind. & Eng. Chem., Easton, Pa.

METALLURGICAL CHEMIST: Recent graduate or several years' experience in sheet steel fabrication and drawing. Company engaged in both vital defense and non-defense activity. Excellent opportunity to establish and develop production control and research. Eastern location.
Box 29-NP-6, Ind. & Eng. Chem., Easton, Pa.

PLANT CHEMIST or chemical engineer with at least two years' manufacturing experience in producing organic chemicals, to take charge of one shift of manufacturing. Essential war work. Permanent. Plant near New York City.
Box 32-NP-6, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST for industrial chemical research. New York State. Previous experience desirable but will consider recent graduate. State qualifications and salary expected. Enclose snapshot.
Box 49-NP-6, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS and CHEMICAL engineers, preferably M.S. or Ph.D. with industrial experience for research in Graphic Arts in Chicago. Give details of training, personal data, and salary desired.
Box 58-NP-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST experienced in extraction of Theobromine from by-products. Applicant should submit details of training and experience, personal data and salary expected, excellent opportunity and permanent employment for qualified man.
Box 70-N-6, Ind. & Eng. Chem., Easton, Pa.

Chemical Engineer
Physical Chemist
Cereal Chemist
Biochemist
Organic Chemist
Food Technologist
Analytical Chemist

Consideration will be given to applications from Bachelors, Masters, Ph.D.s and those with a few years post-doctorate experience. These openings represent opportunities in the Research Laboratories of a food organization located in the East. We are able to consider only men of outstanding qualifications. Applicants should submit educational history, college record, experience, age, and other personal data, with recent photograph.

Box 100-TP-4, Ind. & Eng. Chem., Easton, Pa.

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

SITUATIONS WANTED
(A.C.S. MEMBERS)

NEW PRODUCT? Could I suggest or work out with you that new product? Biochemist, Ph.D. with industrial plant and laboratory experience in vitamins and vitamin products, nutrition, foods and bioassays. Desires supervision of production or research with progressive company. Married.
Box 79-T-3, Ind. & Eng. Chem., Easton, Pa.

TEACHER RESEARCH worker; Ph.D. Majors: Physical chemistry, chemical engineering. Twelve years' teaching these with inorganic, analytical chemistry, etc. Sixteen years' industrial research, consulting, testing. Numerous publications. Employed. Seeking broader field.
Box 22-T-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. course work and research completed. Physical chemistry minor. Publications. Four years' teaching general and organic. Eastern location preferred but not essential. Draft deferred. Available in June.
Box 35-N-5, Ind. & Eng. Chem., Easton, Pa.

ELECTRO-CHEMIST, M.S. with further graduate work equivalent to Ph.D. (Electrochemistry major). B.S. in Chem. Eng. Six years' successful research and development work in electroplating and metal finishing, including bright nickel, high speed tin, copper and nickel, noble metals, alloy plating including brass and silver alloys, etc. Plant experience. Proven ability. Possesses initiative and ability to work with people. Publications and patent. Age 32, employed, 3A.
Box 86-N-5, Ind. & Eng. Chem., Easton, Pa.

AGRICULTURAL and BIOLOGICAL Chemist, B.S. 1938, Pennsylvania State College. Research in Agr. Exp. Sta. Industrial experience in food and dairy chemistry and bacteriology. Draft deferred, age 24, married.
Box 87-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST PHARMACEUTICAL Organic, training in Pathology and Physiology. Graduate work 4 years, Research assistant 3 years, now operating own successful organic synthetic lab. 2 yrs. Wide experience in analysis, research, production, and sales. Honor societies, publications.
Box 26-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.Ch.E. cum laude, M.S., work toward Ph.D., honor societies. Excellent organic training—synthetic, micro-analytic. Food Analysis, vitamins. Studies, plastics, synthetic rubber. Executive, teaching, experiences. Resourceful, co-operative. Age 35, married, draft 4-C. Desires teaching, research, development, production position.
Box 34-T-5, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHER desires to obtain position teaching chemistry only. Nine years' successful experience teaching general, qualitative and organic in college and engineering school. Now teaching chemistry and other sciences. Present position permanent. Would be pleased to have opportunity to do research while teaching. Good recommendations. Ph.D. 1935. Major, organic; minor, general chemistry. Good background in other sciences. Publications. Membership: Sigma Xi, Phi Lambda Upsilon. Protestant, family.
Box 46-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Cornell, B.Chem. 1939, Ch.E. 1940, single 23. Two years' experience development work on organic chemicals, methanol, ammonia. Any location, available immediately. Defense work preferred; principally interested in process development, improvement of existing processes; production if defense industry.
Box 66-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST

Experienced in design and erection of plants for the manufacture of synthetic coal tar dyes and intermediates, prefers employment as a customer contact man or as a field construction superintendent for large construction company preparing plant and equipment installation plans for new projects. Have thorough knowledge of skillful assembly and practical operation of a wide variety of unit processes. Best assets are keen perception and sound judgment—matured by intensive study of plant ills which retard chemical productions.

Box 10-N-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. 1940, industrial production, analytical, and investigative experience, with wide responsibilities. Desires research, development, or production in organic field, with company contributing to war effort. Twice classified 2A. Age 24. Presently employed.
Box 77-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S. Graduate A.C.S. approved college. 2½ years' industrial experience special methods of analysis. Desires to change to research or engineering development with progressive company engaged in vital war work. Married, 26. Draft 3A.
Box 11-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S. in Physics. Two years' production experience in chlorine, caustic, chlorinated hydrocarbons. One year in refinery pilot plant. Now analytical chemist in aircraft plant. Desires position where his abilities can be utilised fully. Married, Protestant. Middle West preferred but not essential.
Box 12-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S., 4 years' analytical experience, 2½ years' research in inorganic non-metallics, plus good background in physics. Defense course "Industrial Spectroscopy." Desires defense work. Prefer supervisory capacity in control.
Box 13-N-6, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST, 32, married, draft deferred, 10 years' experience in compounding, testing and processing rubber and synthetics. Desires position of responsibility with reliable company.
Box 15-N-6, Ind. & Eng. Chem., Easton, Pa.

YOUNG CHEMICAL engineer, B.S.Ch.E. '42, desires position connected with defense. Part time and summer work in food, wax paper, and plastic coatings. Undergraduate thesis in petroleum research. High scholastic standing. Available June 2.
Box 17-N-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH DIRECTOR, Ph.D. with many years' successful executive and laboratory experience developing and improving both organic and inorganic industrial products from initial research through to plant production seeks new permanent responsible position offering definite opportunities. East preferred. Minimum salary $7500.
Box 27-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST and CHEM. Eng. A.B., Ch.E. Columbia University. 3 years' viscose rayon plant. 11 years' development and research with leading consultant. 3 years' chief analyst large food company. Employed but desires change.
Box 30-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEERING executive. Successful experience with large manufacturing corporations both in East and on West Coast as research director, technical director and as consultant. Qualified for organization and management of technical department including research, or for special investigations of new processes or applications of products. Experienced with wide variety of products. Registered patent attorney. Ph.D. Numerous patents and publications.
Box 31-N-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, Ph.D. leading Midwest University. Major organic and minor physical chemistry Held teaching fellowship four years, full time instructor in organic chemistry. One year at large midwest university. One year industrial research experience. Married, 28, Protestant, favorable draft status; member several scientific fraternities. Available on short notice.
Box 33-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S., M.I.T. 1940. Honor student. Graduate assistant small mid-west college 1941-1942. Defense course in powder and explosives. Desires position utilizing mathematical ability. Am not interested in position involving chiefly laboratory manipulative work. Industrial work preferred to research. Location immaterial.
Box 36-N-6, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Sc.D. which required 2 years' beyond Ph.D. Woman with mathematical, teaching, research, and leadership ability. 14 years' experience, 6 as head of departments. Broad knowledge of all related fields nutrition and health education.
Box 37-N-6, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST M.S. Michigan. Single, 41. Twelve years' experience in explosives, rubber, steel, chemicals, paper. One year government explosives inspector. Had charge of two laboratories. Eastern U.S.A. wanted but will consider other locations. Performed research on inorganic problem. Prefer war work.
Box 38-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. May 10, 1942. Have completed fifty-five semester hours of chemistry. Thoroughly trained in analytical, organic and physical chemistry. Age 22, single, draft deferred. Now available. Eastern location preferable.
Box 39-N-6, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL and INORGANIC chemist, M.A. large eastern university February 1942. Desires position in research or development in industry which contributes to war effort. Prefer New York City area; will consider any location. Unmarried, 31, Phi Beta Kappa; employed. Deferred draft classification.
Box 40-N-6, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST. Thorough understanding of biochemistry and related fields. Thirteen years' experience in hormone and vitamin research, including the synthesis, bio-assay and pharmacology of such substances. Employed but available on short notice.
Box 43-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST A.B. Accredited eastern university, June 1942. Major organic. Well trained in physical and analysis. Minor bacteriology. Member Pi Mu Epsilon. Single, 23, draft 2-A. Desires position with company engaged in defense work. Available after June 8.
Box 47-N-6, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL PHYSICAL organic chemist, Ph.D., May 1942. Thorough undergraduate training in organic, inorganic, physical chemistry. Graduate work in pharmaceutical chemistry. Teaching assistant, graduate fellowships. Desires teaching or industrial research. Publications. Phi Beta Kappa, Sigma Xi. Age 25, single, draft deferred, available immediately.
Box 48-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. 1942. Minnesota. Biochemistry major, organic chemistry and bacteriology minors. Has had intensified course in production and handling of explosives and interested in employment in this field. Personal qualifications and references of high quality. Single, Protestant, age 22. Temporary deferment 2-A. Read chemical German. Location immaterial.
Box 50-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S. analytical, organic and physical chemistry. Desires position in defense industry. Has completed National Defense Training Course in Physico-chemical Measurements and is available for immediate employment anywhere in U. S. Married, 3-A draft.
Box 51-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S., one year industrial experience. Desires position in research, production, or development, preferably organic. Eastern location, particularly New Jersey, preferred. Age 27, single, draft deferred. Available immediately.
Box 52-N-6, Ind. & Eng. Chem., Easton, Pa.

PRODUCTION CHEMICAL Engineer, experienced in directing manufacture of inorganic and organic chemicals. Development background. Familiar with process equipment, costs, maintenance, record keeping. Age 36.
Box 53-N-6, Ind. & Eng. Chem., Easton, Pa.

MIDWEST UNIVERSITY instructor. Organic chemist, microscopist. M.Sc. from eastern university; year of recent graduate study; minor in physical chemistry. Decade of college teaching. Married. Available September for research, teaching, etc.
Box 54-N-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Bacteriologist, M.S. Eight years' diversified industrial experience. Research and development on solvents and their applications. Thorough knowledge of alcohol fermentation and plant operation. Resourceful, industrious. Age 37, deferred.
Box 55-N-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, Ph.D. Pharmaceutical, analytical, portland cement. Seven years' diversified experience in American Medical Association Chemical Laboratory; industrial experience in amino acids manufacture, as pharmaceutical control chemist, and in research in portland cement laboratory. Five years' university teaching. Minors, organic chemistry and physics. Married, dependents.
Box 56-N-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, 7 years' general industrial research new products, especially synthetic resins, coatings, intermediates and plasticizers; drying oils and derivatives. Patents, publications on polymerization. Age 28. Employed, 3-A.
Box 62-N-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST (Ph.D.) with 12 years' industrial experience in research, supervision, plant and technical service. Desires executive or administrative position with progressive organization. Four years' University teaching experience. Familiar with colloids, finishes and organic specialties.
Box 64-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. 1942. Organic development and research, 5 years' industrial experience. Interested in occupational change with definite opportunity for future. Draft classification 3-A.
Box 65-N-6, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 779)

(Situations Wanted Continued)

ORGANIC CHEMIST, Ph.D. June, eastern university. Research experience in natural products, organic synthesis, microanalysis, and cancer determinations. Graduate assistantship, Phi Lambda Upsilon, Sigma Xi. Single, age 25, draft deferred. Desires position in organic or biochemical research.
Box 69-N-6, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED (NONMEMBERS)

CHEMICAL LIBRARY position desired by woman-chemist. Wide experience in literature and patent searching. Good scientific and technical background. Fluent use of scientific Russian, Ukrainian, French and German. Typing.
Box 17-T-5, Ind. & Eng. Chem., Easton, Pa.

SPECTROGRAPHIC ANALYST; white, male, finishing ESMDT spectroscopy, U. S. C., no experience, Protestant, 56, married, B.S. '09, salary your schedule, location non-essential.
Box 39-T-5, Ind. & Eng. Chem., Easton, Pa.

SPANISH SPEAKING research chemist desires U. S. or foreign position. Unusually well travelled, raised in South America; five years' graduate work, Ph.D. cand. in Physical chemistry; McGill, M.I.T.; graduate assistantships, research assistantship, Sigma Xi, broad experience, three languages; married, 25, available June.
Box 26-N-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMISTS, M.S., June 1942, large Eastern University; research experience in the field of "Invert Soaps" and quaternary ammonium salts (phenol derivatives); good training in organic analysis and synthesis; familiar with organic micro technique; desires position in organic research or development.
Box 28-N-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, Ph.D., draft class 3, laid off by priorities, versatile experience in responsible positions, development and production of pure chemicals. Trained in all branches of chemistry and bacteriology, capable analyst, knowledge of several foreign languages; desires appropriate work. Age 35, married, Austrian, holding first papers. Excellent references.
Box 35-N-6, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, B.S. 1936, age 27, deferred draft classification. Five years' experience in drug, pharmaceutical and cosmetic fields. Four in analytical work and one in research and development.
Box 41-N-6, Ind. & Eng. Chem., Easton, Pa.

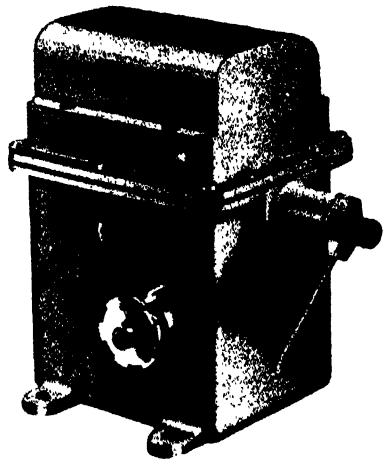
DEVELOPMENT and PRODUCTION in foods and vitamins. Nine years' in research department and ten years' in development of processes and production with large food company. Expert in sterol activation. Capable of directing research and handling men. Location immaterial. Age 43. American.
Box 45-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 25 years' experience, plant layout and operation, organic. Research, Coal coke, petroleum coke, toluol, naphthaline, tar acids, intermediates, dyes, dry colors, aniline oil, synthetic coatings, varnish, carbon black. Protestant. American.
Box 61-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, native of Austria, first papers, single, age 24. College studies in America. A.B. cum laude, M.S. August, 1942. One year organic research. Excellent record, scholarship student, graduate assistantship. Fluently German, French. Sigma Xi, other honors. Available July 15.
Box 63-N-6, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, B.S. Broad experience in enzymes, food products, vitamines, dehydration. Twelve years' in research and industry. Married, age 37, available July 1. Prefer Pacific coast or New York. References, publications.
Box 66-N-6, Ind. & Eng. Chem., Easton, Pa.

BACTERIOLOGIST-CHEMIST: M.S. Three years' graduate work in leading universities; two years' industrial fellowship. Teaching and commercial research experience. Young, Gentile, draft deferred. Prefer position in defense effort. Location immaterial.
Box 67-N-6, Ind. & Eng. Chem., Easton, Pa.



Industrial News

CONTINUED FROM PAGE 778

carbon in all types of compounds without sacrifice of physical properties, according to the supplier.

It is insoluble in water and in common organic solvents and can be used in compounds requiring chemical resistance. It also acts as a plasticizer, permitting easier processing of uncured stock on mill, tuber, or calender, and as a dispersing agent for carbon black in heavily loaded compounds.

Microtrol

A UNIT for operating butterfly valves, multiple ratio fuel valves, and regulation of dampers in air conditioning and drying systems has been developed by the Barber-Colman Co., Rockford, Ill.

Bausch & Lomb MacArthur Month

IN *The Balco News*, Bausch & Lomb announced on April 2 a campaign extending from April 6 to May 9 to be known as "MacArthur Month", a period within which every employee was invited to cudgel his brains for ideas to improve production and save time and materials.

To encourage the flow of ideas, the company doubled its customary awards for suggestions to improve production and put up $5,000 in cash awards to spur workers to a closer scrutiny of their jobs and the production lines around them.

A 30-minute "Production for Victory" program, in which representatives of the Army and Navy participated, was broadcast from Station WHEC in Rochester, N. Y., so that every war worker in the city and surrounding territory could hear a dramatic story of the nation's needs and the urgency of production.

Time Schedule Controller

MAINTAINING exact temperature, pressure, flow, or liquid level according to a predetermined time schedule is the duty of the Taylor Fulscope time schedule controller.

The cam and chart are individually mounted and conveniently located for instant visual comparison on this latest development of the Taylor Instrument Companies, Rochester, N. Y.

Respirator

THE American Optical Co., Southbridge, Mass., announces a new respirator for protection against toxic dusts. Representing a new design in toxic dust respirators, this R9100-T respiratory protector is light in weight and gives full vision, while the entire face piece is itself a filter. The filter has been approved by the U. S. Bureau of Mines for protection against the inhalation of toxic or poisonous dusts (dispersoids or particulate matter formed by the disintegration of solid materials by such processes as crushing, grinding, and abrading) as lead, cadmium, arsenic, chromium, manganese, selenium, vanadium, and their compounds.

Navy E Awards

THE Navy E has been awarded to the Crane Packing Co., Chicago, Ill., for production achievement and a high record in shipping Navy materials on schedule.

The Rome Division of Revere Copper and Brass Inc., New York, N. Y., is the second Revere division to win the Navy E. It was presented on May 9 for excellence in production.

The first All-Navy E burgee with star awarded to an industry in the United States went to the Bausch & Lomb Optical Co. on May 18 in recognition of its outstanding record in naval ordnance production.

The Farrel-Birmingham Co., Inc., has been awarded the Navy E for its three plants at Ansonia and Derby, Conn., and Buffalo, N. Y., in recognition of excellence in the production of gear drives for navy ships. Presentation was made on May 10.

Corrosion Inhibitor

THE D. W. Haering & Co., Inc., Research Laboratories, Chicago, Ill., announces a new corrosion inhibitor identified as ferri chrom glucosate. This is a colloidal gel which may be used for film formation in process operations by dipping or spraying or may be incorporated in paints or lubricants for corrosion control.

Metal Cleaner

A SOLVENT emulsion type of metal cleaner, known as Lixol, has been introduced by the Cowles Detergent Co., 7016 Euclid Ave., Cleveland, Ohio.

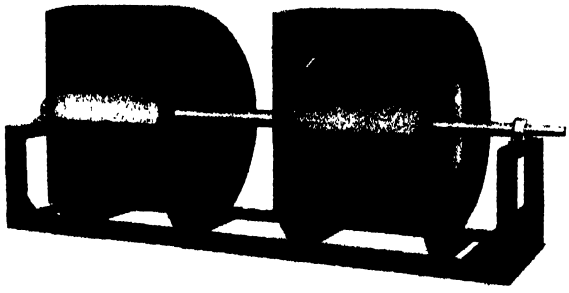
FOR SALE: Check this list or write us your needs. Immediate delivery is still available from our stock. International Centrifuges, Drying ovens, Microscopes, Analytical balances, autoclaves, hydraulic presses, Hanovia Quartz lamps, Torsion scales, Pulverizers, paper testing machine, MicroPhotographic camera Spencer, Electric hot plates (new) three heat heavy duty type, etc. We want to buy complete laboratories or surplus equipment. Send us your lists for immediate offer. The Laboratory Exchange, 24 East 21st Street, N. Y.

WANTED: Rubber mills, laboratory or production size, good condition.
Box 46-N-6, Ind. & Eng. Chem., Easton, Pa.

WE OFFER 100 pounds Pure Titanium Metal Powder, 10 pounds Zirconium Nitrate, 1000 pounds Cerium chloride, 2000 pounds Copper fluosilicate, 2000 pounds Strontium nitrate, 500 pounds Iron Carbonyl, Kilo each Caesium or Rubidium chloride, 5 kilos Indium chloride.
Box 59-N-6, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: "Faraday Society Transactions": Vols. 3-9, 14, 17-36; "The Analyst" (London): Vols. 9-65 (1884-1940); "Journal, Society of Chemical Industry": Vols. 1-60; "Chemical Abstracts", bound set; Beilstein: "Handbuch der organischen Chemie": third edition, complete with supplements; Friedlander: "Fortschritte in der Teerfarbenfabrikation": Vols. 1-12. A. Calvert, 221 Seaman Ave., New York, N. Y.



WANTED: Mellor's "Comprehensive Treatise on Inorganic and Theoretical Chemistry," complete set or separate volumes; "Der Aufbau der Zweistoffleigerungen."
Box 18-T-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: Who can supply any salts of the following elements in small or large quantity: Dysprosium, Erbium, Europium, Godilinium, Hafnium, Rhenium, Thulium, Terbium, Ytterbium? State purity. Also wanted 500 pounds Lithium.
Box 60-N-6, Ind. & Eng. Chem., Easton, Pa.

Motor Blower Units

PRODUCTION of motor blower units in a wide range of sizes is announced by the Niagara Blower Co., 6 East 45th St., New York. The units are available in 16 models—one-, two-, and three-fan assemblies to meet resistance up to 4-inch static pressure and in capacity from 880 to 42,600 c. f. m. Fan speeds range from 300 to 1,750 r. p. m.

The blowers are available in two series of fan designs. Series 1,100 gives large volumes of air with quiet operation at low fan speeds for static pressures up to 1.5 inches. Series 1,200 meets the resistance of duct systems and special conditioning equipment, protecting motors from overload by a retarded horsepower curve, for static pressures up to 4 inches.

THE Chamberlain Engineering, Ltd., a unit of The United States Stoneware Co., has purchased a 10-acre group of buildings at Ravenna, Ohio, where the manufacture of Tygon synthetic rubberlike products will be transferred soon. The buildings are being extensively remodeled and new plant equipment is being installed.

Fuel Tank Sealer

A FUEL tank sealer of brush-on type, which resists the action of aromatic fuels, has been developed by the Presstite Engineering Co., St. Louis, Mo. It is designed to seal integral tanks in airplanes and for inside seams and joints in bolted steel tanks.

pH Tests

THE Cargille buffer set No. 1, made by R. P. Cargille, 118 Liberty St., New York, N.Y., is designed for control tests in the plant by unskilled workmen and for quick preliminary tests in laboratories where more elaborate pH apparatus is available.

New Phenolic Resin

A SPECIAL phenolic resin known as Inwal has been produced by the Synvar Corp., Wilmington, Del., for impregnating wood. It is alcohol-soluble, characterized by high-penetration power and chemical and water resistance.

STEAM JET EVACTORS

AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm absolute, also small condensers and vacuum chilling equipment

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

CROLL-REYNOLDS CO.

17 JOHN STREET — Established 1917 — NEW YORK

Specify **Florite Desiccant**

For Efficient Dehydration of GASES and LIQUIDS

FLORITE, the new granular drying agent, is now being used successfully for dehydrating natural gas, propane, gasoline, air, nitrogen, carbon dioxide and other gases and liquids where high drying efficiency is required.
It selectively adsorbs 4 to 20% of its weight in water, depending upon the particular application, and is regenerated by heating to 300-350°F. FLORITE is hard, stable, non-corrosive, non-poisonous, and is available in a variety of particle size classifications.

Manufacturing Chemists' Association Meets

H. L. Derby

George W. Merck

Charles Belknap

Lammot du Pont

W. N. Watson

J. W. McLaughlin

THE Manufacturing Chemists' Association of the United States, with the largest attendance in its history, held its 70th annual meeting on June 4 at the Waldorf-Astoria Hotel in New York, with Lammot du Pont presiding. Following certain committee meetings in the morning, a closed session was held at 2:00 o'clock, when the annual business was transacted and the following officers elected for the ensuing year: president, H. L. Derby, American Cyanamid & Chemical Corp., 30 Rockefeller Plaza, New York, N. Y.; vice presidents, George W. Merck, Merck & Co., Inc., Rahway, N. J., and Charles Belknap, Monsanto Chemical Co., St. Louis, Mo.; treasurer, J. W. McLaughlin, Carbide & Carbon Chemicals Corp., 30 East 42nd St., New York, N. Y.; secretary, Warren N. Watson, 608 Woodward Bldg., Washington, D. C.; executive committee, Lammot du Pont, chairman, E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., E. M. Allen, The Mathieson Alkali Works, Inc., 60 East 42nd St., New York, N. Y., Leonard T. Beale, Pennsylvania Salt Manufacturing Co., Widener Building, Philadelphia, Penna., H. I. Young, American Zinc, Lead & Smelting Co., St. Louis, Mo., Russell H. Dunham, Hercules Powder Co., Inc., Delaware Trust Building, Wilmington, Del., C. F. Hosford, Jr., Pennsylvania Coal Products Co., Petrolia, Penna., H. O. C. Ingraham, General Chemical Co., 40 Rector St., New York, N. Y., August Kochs, Victor Chemical Works, 141 West Jackson Boulevard, Chicago, Ill., Clyde D. Marlatt, The Martin Dennis Co., 859 Summer Ave., Newark, N. J., Charles S. Munson, U. S. Industrial Chemicals, Inc., 60 East 42nd St., New York, N. Y., T. P. Walker, Commercial Solvents Corp., 17 East 42nd St., New York, N. Y.

H. L. Derby, chairman of the Executive Committee, presented the Annual Report of the Executive Committee, part of which follows:

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training. Future developments will be brought to the attention of our readers.

Annual Report, Executive Committee, Manufacturing Chemists' Association

Since last June, the impact of our war program has deeply and progressively made itself felt upon our entire economy in its conversion to a full war effort. The acceleration after Pearl Harbor is illustrated by the dollar volume of government contracts and commitments as follows:

November 1941	$ 1.8 billions
December 1941	$ 5.1 billions
January 1942	$ 8.4 billions
February 1942	$20.9 billions

The magnitude of the war effort is indicated by funds made available by Congress and the RFC from June 1940 to May 1, 1942, amounting to the stupendous figure of 162 billion dollars, of which over three fourths are committed. About one third of our national income is being expended for war purposes. Government expenditures for war purposes in April exceeded 3.4 billion dollars or an annual rate of over 40 billion dollars. The program contemplates a doubling of this outgo for the coming fiscal year. War funds available to date are approximately divided as follows:

	Per cent
Planes	23
Ordnance	21
Munitions and supplies	12
Naval ships	10
Industrial facilities	9
Posts, depots, and stations	8
Merchant ships	5
Stockpile and food exports	4
Pay, subsistence, and travel for the armed forces	3
Housing	1
Miscellaneous	4
	100

Conversion to all-out war effort has involved the following steps: conversion of industry to war production; control of industry as to products made and destination of shipment through priorities, limitation, and allocation orders; price control, first determined for individual items and followed by the "big freeze" effective last month; control of transportation, both freight and passenger, by rail, water, and truck, which has become an integral part of rationing, and delivery of raw materials and finished products; and control of exports and imports. In addition, labor relations and wage changes are under supervision of various war agencies, more recently by the War Labor Board. Thus, we have reached a point of total government control of our economy even down to the rationing of ultimate consumer items.

The foremost chemical participation in the war program has been for explosives and raw materials therefor. This has necessitated a very large expansion of existing facilities as the pre-war explosive capacity was insignificant in comparison with war demands. During the past year the production program for both explosives and raw materials has been greatly increased. In addition, war demands for many other chemicals have necessitated the installation of increased plant capacity. Direct government purchases of chemicals are only a part of the total war consumption, as virtually all fabricated products purchased by the Government involve processing with chemicals.

A significant feature of our war program has been the constantly rising chemical demands owing to the fact that we not only have the obligation of supplying our own armed forces but those of the United Nations, including heavy shipments to Russia, Great Britain, the Far East, and obligations to the American Republics.

Heavy losses of personnel owing to the recall of reserve officers, the draft, and enlistments have imposed a heavy problem upon the chemical industry, which on account of rapid expansion has of necessity been compelled to dilute its operating and technical personnel. In addition, the new equipment has become so scarce that only equipment for direct war contracts is obtainable, and then only with difficulty and delay. The continuous volume of questionnaires from various war and government agencies has been beyond the capacity of the staff of the industry as a whole to handle within the time prescribed. In the early war period many of the questionnaires were not correlated, and there was much duplication. It is very evident that if you divide your operations into three segments—defense (direct and indirect), essential civilian, and nonessential civilian, the last category represented by nonessential civilian has practically disappeared.

In the spring of 1939 at the request of the Assistant Secretary of War, the Chemical Advisory Committee of the Army and Navy Munitions Board with a series of subcommittees was organized. This advisory committee has had continuous activity with heavy responsibilities during the past year. This work has called for a heavy contribution of time and effort from many members of the industry, with weekly meetings for some of the committees and frequent calls to Washington for conferences. The Chemical Advisory Committee is independent of the Manufacturing Chemists' Association.

Container Standardization

In June 1941, the M. C. A. Executive Committee set up a Container Standardization Committee to survey the chemical container field for possible savings in strategic materials and to recommend standardization and simplification procedures in specific cases where such savings would facilitate transportation of chemicals and aid the war effort. This committee has been composed of the technical committee chairmen, with M. F. Crass, Jr., assistant secretary of the M. C. A., as chairman. It has worked in close cooperation with the several government agencies directly interested in container supply, principally the OPM and its successor, the WPB. Recommendations for standardization and simplification were tentatively agreed upon following the holding of conferences with industry representatives directly concerned. Tentative recommendations were then submitted to individual firms and to the executive committee for approval before they were submitted to the WPB and made public. Specific projects handled are listed below. In each case, the industry voluntarily adopted the standardization recommendations. The accomplishments of this committee have been responsible in substantial measure for the maintenance of supplies of requisite containers needed for the shipment of chemicals absolutely necessary for the war effort and essential civilian supply. Committee projects include:

(1) Standardization of the Glass Carboy Bottle. Agreement among users of the 12-gallon bottle to abandon this type on future orders and adopt the standard M. C. A. 13-gallon type has had the following results: increased by 8½ per cent the volume of liquid shipped per container, and increased the productive capacity of the carboy manufacturer by at least 10 per cent through elimination of lost time and breakages necessitated by size changeovers. Since this project was approved, there has been no shortage of carboy bottles and a substantial inventory of finished stock is now on hand at the bottle plant.

(2) Single-Trip Drums for Liquids. The chemical industry has voluntarily agreed to limit single-trip liquid-type drums to two sizes—5 and 55 gallons. This has reduced stocks of specialty and

The American Chemical Society assumes no responsibility for the statements and opinions advanced by contributors to its publications.

C.; Telephone, Republic 5301; Cable, Jiechem (Washington). Advertising Department, 332 West 42nd St., New York, N. Y.; Telephone, Bryant 9-4430. Entered as second-class matter at the Post Office at Easton, Penna., under the act of March 3, 1879, as 24 times a year on the 10th and 25th. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized July 13, 1918.
Annual subscription rate, $2.00. Foreign postage to countries not in the Pan American Union, $0.60; Canadian postage, $0.20. Single copies, $0.15. Special rates to members.
No claims can be allowed for copies of journals lost in the mails unless such claims are received within 60 days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days' advance notice required.) "Missing from files" cannot be accepted as the reason for honoring a claim. Charles L. Parsons, Business Manager, 1155 16th St., N. W., Washington, D. C., U. S. A.

odd-gage sheet in drum manufacturers' shops and enabled them to carry higher inventories of volume-size sheet, facilitating delivery of drums. Shippers' delivery problems have been simplified and an over-all saving of steel accomplished.

(3) Returnable Drums for Liquids. Shippers agreed to limit such drums to the 10-, 20-, 30-, and 55-gallon sizes and to order no more intermediate sizes. Advantages gained are similar to those outlined under (2) above.

(4) Caustic Soda and Alkalies. A conference of 13 producers drafted recommendations reducing from 21 to 3 the sizes of drums used for solid, flake, and ground caustic soda and potash, and reducing the gage of metal permissible for construction of such drums. This has resulted in an appreciable saving of steel. Bleaching powder drums, multiwall paper bags, wooden barrels and plywood drums for soda ash, bicarbonate of soda, calcium carbonate, and calcium chloride were standardized to effect savings of container materials, and the use of burlap bags abandoned in most cases in favor of paper.

(5) Trisodium Phosphate Containers. Efforts of the committee have been successful in causing adoption by the industry of a standard multiwall paper bag with abolition of burlap bags in shipping.

(6) Aluminum Sulfate and Alums. Producers have agreed to stop shipping alums in steel drums and burlap bags. Adoption of a standard multiwall paper bag has resulted in savings of substantial quantities of strategic materials.

(7) Sodium Bisulfate (Niter Cake). Use of steel drums has been abandoned by all shippers. Use of wooden barrels and plywood drums of specific construction has been agreed to by producers concerned.

(8) Synthetic Resin Molding Compounds. Although not completed, this project has resulted in the saving of substantial amounts of strategic materials.

Technical Committees

During the past fiscal year the association's technical committees sponsored a number of important container and transportation items before the various regulatory agencies of the U. S. Government, and briefs were submitted or appearances made in other instances. Of considerable importance to the industry was the approval granted by the Interstate Commerce Commission for use of a 16-gage single-trip sulfuric acid drum, and authority for use of I. C. C. 103A and 103B tank cars with safety vents provided with 1/8-inch breather holes. Other submitted items for changes were approved and additional items are pending, including requests for authorization of a light-weight carboy assembly under Specification 1A and for changes in fiber and plywood drum specifications to permit shipment of larger insecticide and other Class B poison units.

Realizing the seriousness of the container procurement situation, representatives of the technical committees met with Bureau of Explosives officials in June 1941 to urge that authorization for re-use of reconditioned single-trip metal barrels and drums be made. On August 7 member executives were advised that the bureau, after consultation with the Interstate Commerce Commission, would grant authorization to individual firms for the transportation of regulatory articles in reconditioned drums upon receipt of application and the furnishing of specific information thereon. This action has been of substantial importance in enabling chemical firms to maintain their scheduled deliveries during the past year.

Manuals

Manual C-1, the shippers' carboy manual, has been completely revised and rewritten during the past year. Manuals now in preparation include unloading of tank cars containing flammable liquids, and handling and use of multiwall paper bags. Revisions will be made in the next reprinting of manuals D-31 and TC-1.

An informal talk was given by E. W. Reid, chief of the Chemicals Branch, WPB, on "Operations of the Chemicals Branch", followed by an open forum in which D. P. Morgan, deputy chief, and W. G. Whitman and H. F. Coith, assistant chiefs, participated. E. R. Weidlein, technical adviser to the Rubber Reserve Company and chief technical consultant to WPB, discussed the "Chemist's Contribution to the War Program". Then followed a sound motion picture in full color on man's fight against insects and plant diseases, a film prepared by the General Chemical Co.

Following a social and cocktail hour the union dinner with the Synthetic Organic Chemical Manufacturers Association was held, at which Neil Carothers, dean of the College of Business Administration, Lehigh University, discussed "Our Present Economic Situation".

Division of Petroleum Chemistry to Meet in Buffalo

The Division of Petroleum Chemistry of the American Chemical Society will hold sessions in Buffalo. This decision was made after the printing of the preliminary program for the meeting in Chemical and Engineering News for June 10, pages 717 to 725. Those wishing to present papers must submit to the acting secretary before July 10 three copies of a 100-word abstract AND three copies of a 1,000-word abstract; before July 16, three copies of the complete paper must be in the hands of the acting secretary. If the paper in form for publication is submitted in triplicate by July 10, the 1,000-word abstract is unnecessary.

Send abstracts and papers to L. M. Henderson, Acting Secretary, Division of Petroleum Chemistry, Pure Oil Co Laboratory, Box 266, Winnetka, Ill.

Chemical Abstracts

Subscriptions and Export Censorship

The Technical Data License Division of the Bureau of Export Control, Board of Economic Warfare, has disapproved the mailing of the June 20 issue of *Chemical Abstracts* to all foreign countries except Canada, England, Australia, New Zealand and Russia. As this has been done without objection to any specific wording or abstract therein, and appears to have been adopted as a policy for this particular scientific publication, the American Chemical Society cannot accept subscriptions to it from other countries pending further notice.

Subscriptions already received and paid for from all Latin American countries (including Cuba and Mexico), from Eire, Belgian Congo, Egypt, Kenya, Liberia, South Africa, Tanganyika, India, Iran, Palestine, Syria, Turkey, British West Indies, Fiji Islands, Iceland, Mauritius, and the Netherlands West Indies will be held in storage until such time as the Government permits their export to the rightful owners.

The American Chemical Society is helpless in the premises.

Charles L. Parsons
Business Manager

Seventh Unit Process Symposium

The Seventh Unit Process Symposium will be held by the Division of Industrial and Engineering Chemistry at the meeting of the American Chemical Society in Buffalo, September 7 to 11. Authors desiring to present papers before the symposium should communicate at once with R. Norris Shreve, Purdue University, West Lafayette, Ind., symposium chairman.

Change in Program for Buffalo A. C. S. Meeting

The general meeting of the American Chemical Society at Buffalo will be devoted to a series of papers on a matter of vital interest to the public and to every chemist and chemical engineer, scheduled for Wednesday afternoon because normally that is the time of maximum attendance. The subject and speakers cannot be announced until publication of the final program in Chemical and Engineering News for August 25.

Divisional programs will start Monday afternoon, continue through Wednesday morning, and be resumed Thursday morning. Divisional officers should bear this in mind in arranging their programs.

Defend Our Patent System

THE present attack upon our patent system is not merely a question of amending the patent law to correct certain alleged abuses, but focuses upon the very essence of the system. We are indebted to the A. C. S. Patent Committee for the following analytical summaries of bills now before the Senate Committee on Patents.

S. 2303

Section 1 provides that whenever during war the President (through anyone he may direct) declares the manufacture, use, or sale of any material, article, product, or commodity or the expansion of facilities or capacity for such manufacture, use, or sale is in the interest of national defense or of the prosecution of war, two results will follow:

(*a*) He may grant licenses under any specific patents with respect to the subject of the declaration on such terms and for such period (not limited to the war period) as he may prescribe and fix a reasonable royalty therefor (all without notice and with no legislative rule for determining royalty). The royalty is not guaranteed by the Government, but if it is not paid the patentee may sue the licensee and recover not more than the prescribed royalty, without damages or injunction, and the licensee may plead lack of validity and lack of infringement.

(*b*) Anyone may infringe any patents with respect to the subject matter of the declaration (without notice) and no royalty is guaranteed by the Government, but the patentee may sue for infringement and recover reasonable royalty, without damages or injunction, and the infringer may plead lack of validity and lack of infringement.

A representative of the Department of Justice before the Senate Committee said (Printed Record, Part 1, page 24):

> These dual effects of the President's finding and declaration may operate independently or together. The President may declare, for example, that the manufacture of magnesium is in the interest of the prosecution of the war for the duration, but may choose to issue no specific licenses thereunder. The declaration will have the effect of a general license to whoever desires to use any patents relating to the manufacture of magnesium, whether or not he or anyone else holds a specific license from the President under those patents. The patent owner will be precluded for the duration of the war from obtaining an injuction against infringement of his patent by such manufacture, and from recovering treble damages on account of the infringement. The exclusive remedy of the patent owner will be the recovery of a reasonable royalty from the infringer, which may either be agreed upon by the parties or fixed by a court.

Section 2 provides that whenever during war or a period of declared national emergency the President (through anyone he may direct) shall determine it to be in the interest of national defense, he may acquire patents, applications, inventions, or licenses by taking or otherwise and issue licenses thereunder. The taking is effected by notice given by the Commissioner of Patents to the record owner and publication in the Official Gazette and the owner must sue in the Court of Claims for fair compensation with all defenses reserved to the Government.

S. 2491

The bill in general follows the recommendations of TNEC and is not limited to war or defense.

Section 2 provides that patents already granted and to be granted shall be subject to compulsory license on such terms as the Commissioner of Patents shall fix if (1) the patentee fails for three years without reasonable justification to manufacture under the patent, (2) patentee has refused for three years to grant licenses for just and reasonable compensation, and it is found that there has resulted or there is likely to result a violation of the anti-trust laws or "is otherwise detrimental to public interest".

Section 3 provides for proceedings before the Commissioner of Patents to procure license with notice to the owner and hearing and review by a court.

Section 4 prohibits license under any patent with any condition which restricts (a) extent, quantity, or value of operations under the license; (b) price of sale; (c) purpose or manner of operations; (d) geographical area of operations.

Section 5 prohibits activities contrary to Section 4 under licenses heretofore made.

Section 6 provides for suit by Government to cancel patents for violation of provisions of the Act.

Section 7 provides that assignments, licenses, etc., must be in writing (including conditions) and publicly recorded with Federal Trade Commission, together with names and addresses of parties and identifying patents.

Section 8 provides manufacturer or supplier must be sued before suit is brought against seller or user and no suit against contributory infringer except after decree against primary infringer.

Section 9 provides no license or conveyance shall substantially lessen competition or create monopoly unless necessary to promote the progress of science or the useful arts.

Individuals and manufacturers generally, particularly those who may be classed as small manufacturers, are urged to express their opinions on this legislation to their own Senators, urging these representatives of theirs to present their constituents' views to the Senate Committee on Patents and on the floor of the Senate, if the bills reach that stage.

Degreasing Solvent

A. F. CURRAN, Curran Corp., Malden, Mass., has received a patent on a new use for Gunk, a self-emulsifying degreasing solvent for automotive use. The new oil is said to be useful for treating gun bores or other metal surfaces which have been wet with salt water and as a lubricant cleaner-preservative which will remove salt and dehydrate the bore of rifled mechanisms in a single operation.

Dyes That Hold

DEVELOPMENT of the American dye industry is an outstanding instance of the new industrial preparedness which has been brought about in the United States through scientific research during the period between the first and second World Wars.

Four times as much cotton as wool is needed to equip the American fighting man for war. That fact is a challenge to the dye maker. Tents and tarpaulins, haversacks and cartridge belts, covers for canteens and cannon, leggings and summer uniforms are all made of cotton fabrics that must be dyed with the fastest of colors—colors that will "hold" despite storm and tropical sun, despite the most punishing kind of wear and repeated washings.

Warned by the first World War, when faded cotton equipment worried every American field commander, as early as 1920 the United States began setting up guards against any recurrence of "whitening" uniforms in future wars. That dyes needed are being produced here now, and in quantities demanded by an unprecedented war effort, represents a significant accomplishment in industrial preparedness—a quarter century of long, hard struggle by the American chemical industry to become self-sufficient in the dyestuffs field.

Today a top rating for a dye means that its color will remain true over many months of strenuous wear and in some cases will withstand years of service under all color-destroying conditions usually encountered. Dyes of this type today constitute the standard colors of the Nation's armed forces on land and sea alike.

The Du Pont company's share in this development has been no small one. The annual production of the largest single dyestuff used in the dyeing of uniform cloth reached in Du Pont plants, in 1941, a point 16.5 times greater than the total 1939 output. It is estimated that Du Pont is producing more than one half of all the essential anthraquinone vat colors required today for the dyeing of cotton uniform cloths and similar equipment for the United States Government.

Phosphorescent Dyes for Blackouts

IMPROVED phosphorescent dyes and pigments to make a pedestrian's clothes visible in a blackout, though not visible from an airplane 2,000 feet above, have been described by S. G. Hibben of the Westinghouse Electric and Manufacturing Co., East Pittsburgh, Penna. After a 20-minute exposure to light, the pigments give off a glow for 6 to 10 hours bright enough to stand out in total darkness on signs, markers, clothing, and streets to guide traffic and pedestrian movements.

Historical Notes on Buffalo

Scene of the 104th Meeting of the American Chemical Society

September 7 to 11, 1942

Looking north from Ferry Street Falls in the village of Black Rock in 1825. Niagara River at left is flowing toward the falls; Erie Canal is at right. Here the boats had to leave the quiet waters of the canal and enter the river, which necessitated harder pulling for the tow animals. The men of Buffalo turned out at the call of their leader and built the first breakwater, that the canal boats might continue in quiet waters to the town of Buffalo and the city not lose the prestige of being the western terminal of the Erie Canal.

GROUPED around lower Main Street and the Terrace, where the new Memorial Auditorium now stands, was once the thriving trading post and settlement of Chabert Joncaire, constructed in 1758 by the order of D'Vaudreuil. This early settlement was short-lived, for the following year Fort Niagara fell to the British under Major-General Sir William Johnson and the village of Joncaire was destroyed along with French power in this part of the country.

Although records in the British Museum dated 1764 show the site of Buffalo, it was 1784 when the first permanent white settlers, Captain William Johnston and his family, constructed their home on a tract of land bought from the Indians. In 1790 the Holland Land Co. bought four large tracts in western New York and sent Joseph Ellicott, their surveyor, to lay out the plans for a town on Buffalo Creek that was to be called "New Amsterdam".

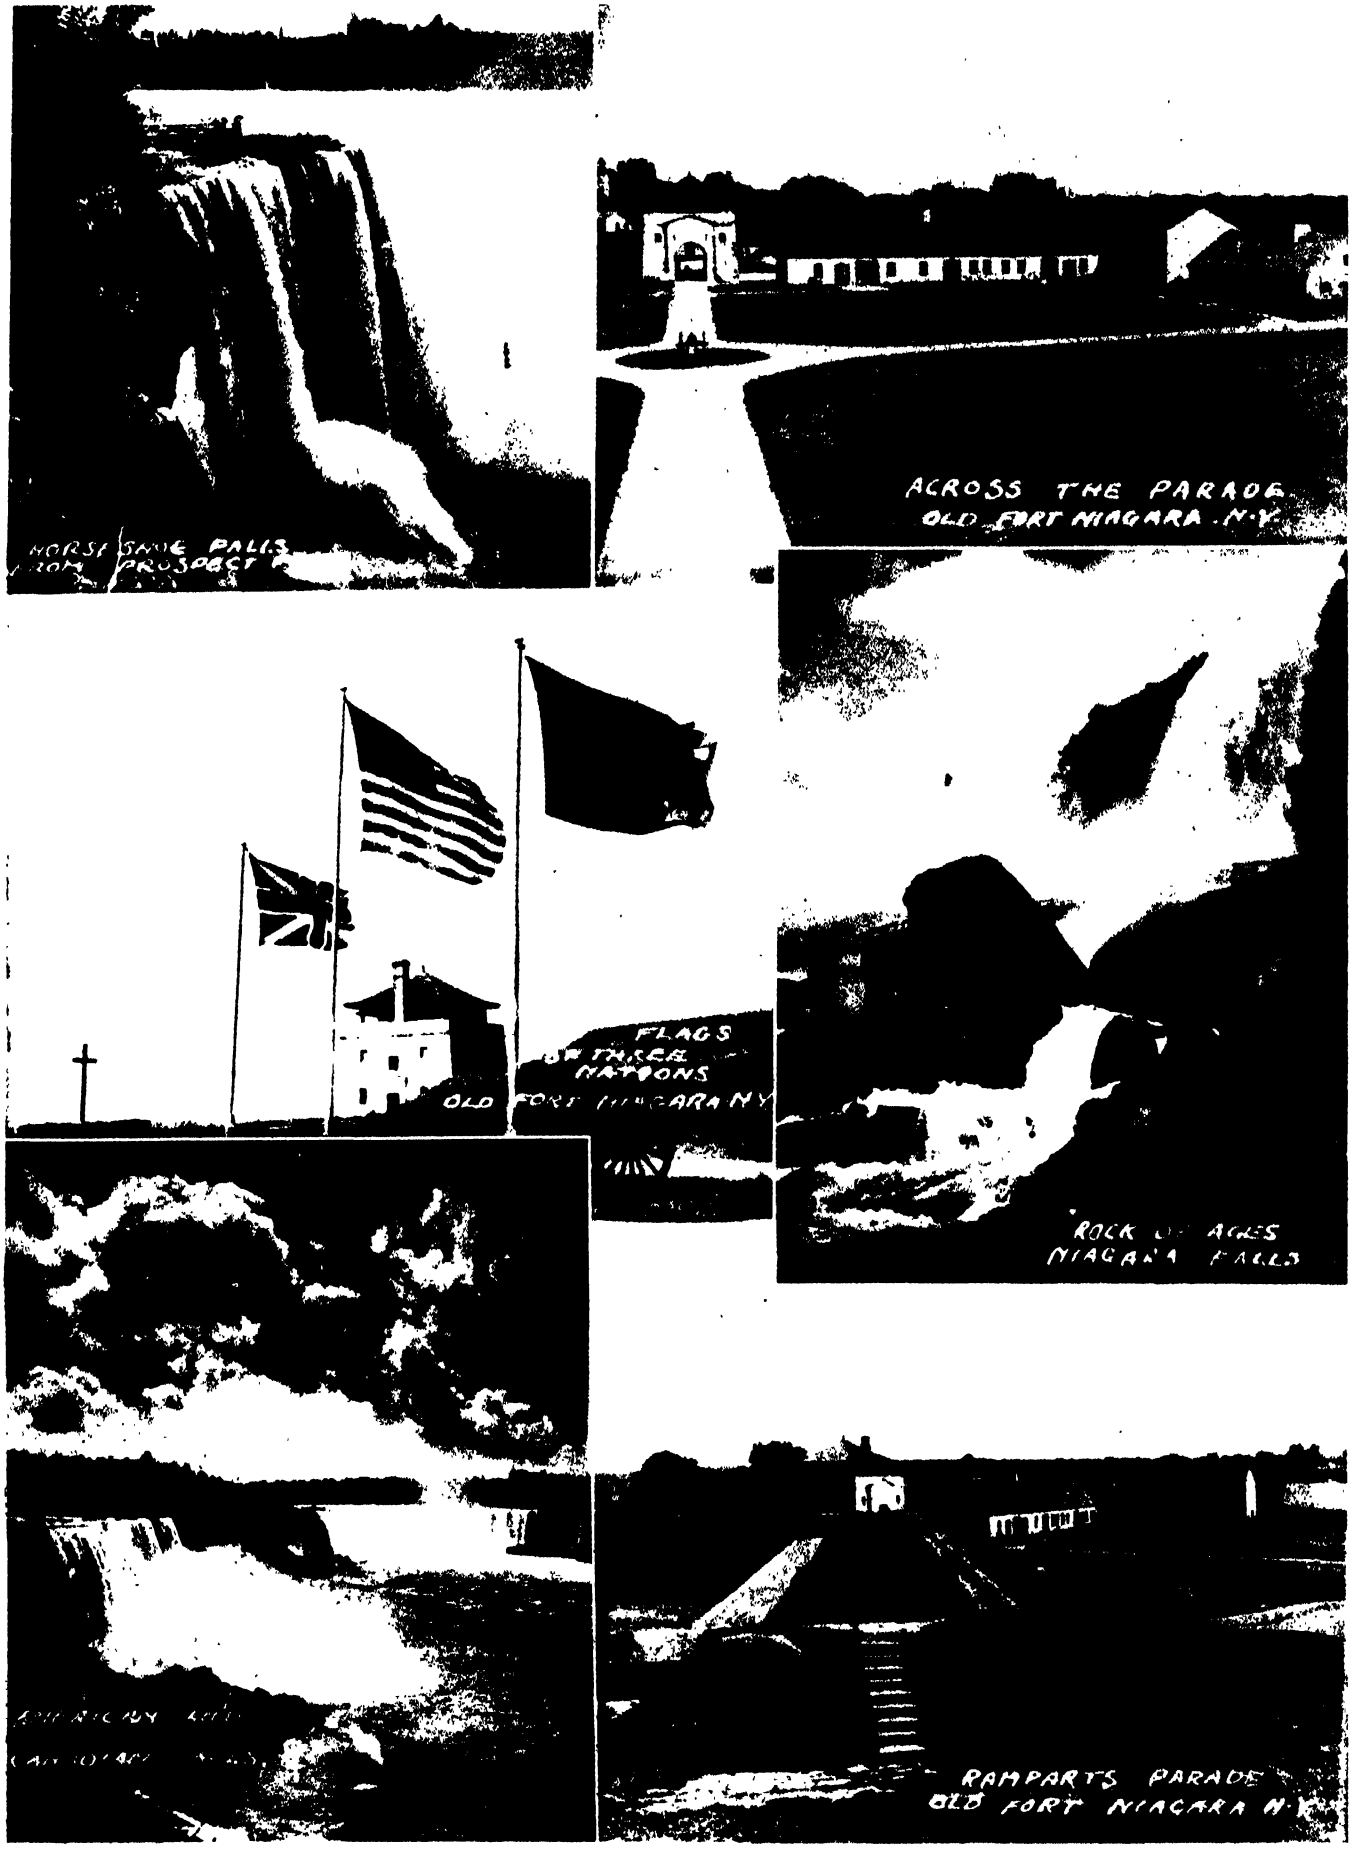
When the war of 1812 came, the village then known as Buffalo, numbered about 1,500 inhabitants. A number of small skirmishes of this war took place in and around Buffalo. The major blow came the night of December 30, 1813, when the British garrison from Fort Erie accompanied by Indian allies attacked and burned the city of Buffalo. The following year it was rebuilt, and Buffalo has had a continuous and progressive growth since. Buffalo became an incorporated village April 5, 1816.

The Holland Land Co. in 1820 donated the site on Shelton Square where St. Paul's Episcopal Cathedral built its original church. This is the earliest known church edifice erected within the city limits.

With the opening of the Erie Canal October 26, 1825, Buffalo's advantages as a navigation center boomed into reality, the hauling costs from the Hudson River to Lake Erie being reduced from $100 to $10 a ton. Buffalo became a chartered city in 1832, and elected as its first mayor Ebenezer Johnson. About 1845 an era of prosperity started which developed Buffalo into a great commercial center. In 1846 the University of Buffalo received its charter from the State Legislature, and began operating as a medical school.

Two presidents of the United States, Millard Fillmore and Grover Cleveland, are honored sons of Buffalo.

In 1901 the Pan American Exposition made known to the world Buffalo's resources. During this celebration on September 6, 1901—one of the saddest days in Buffalo history—President McKinley was assassinated in the Hall of Music situated northeast of the Buffalo Historical Museum, the only permanent building of the exposition.



At 641 Delaware Ave. is the Ansley Wilcox home built in the 1830's as the major's house of the old Poinsett Barracks which became famous when Theodore Roosevelt there took the oath of office as President of the United States upon the death of President McKinley in 1901.

At 472 Delaware Ave. still stands the Buffalo home of Mr. and Mrs. Samuel Clemens (Mark Twain), a former editor and part owner of the *Buffalo Express*.

The Hotel Statler stands on the site of the home of President Millard Fillmore, later known as Castle Inn. Niagara Square on which this hotel is situated is the civic center, containing the new City Hall, new United States Court House, new New York State Building, and the Buffalo Athletic Club.

A number of historical points in downtown Buffalo, within easy walking distance of the Hotel Statler, are listed below[1]. For the convenience of the convention guests, there will be posted in a central location in the hotel this same list, but with each item numbered, and a map on which the numbers will be entered. None of the buildings on the list exist any

[1] In preparing these notes Earl L. Booth has leaned heavily on material furnished by the Buffalo Historical Museum.

On to the Buffalo Meeting

September 7 to 11, 1942

Buffalo Creek from the corner of Main Street and the Terrace in 1825. It bears two barges and two sailing ships. Beyond the houses is a second creek, called Little Buffalo Creek, and beyond the tongue of land is the expanse of Lake Erie. This spot was the original settlement which grew into present-day Buffalo.

more, except the Castle at the site of Fort Porter, a water front park, and the Historical Museum.

Samuel Pratt's store and trading post built in 1804.

Site of John Crow Tavern. In 1804 Erastus Granger took up his abode there and was appointed first Buffalo postmaster. In 1806 the tavern was sold to Joseph Landon. After the burning of Buffalo the tavern was rebuilt. In 1843 and 1846 it was rebuilt and altered several times until, as the Mansion House of Civil War days, it was known as one of Buffalo's best hotels.

Home of Louis LeCouteulx, a French gentleman who became an American citizen and one of Buffalo's earliest philanthropists.

Just north of the last-named property on Main Street was the scene in 1814 of the execution of a Chippewa spy by the hand of Farmers Brothers.

House of Cornelius Winney, a meeting place for Captains Johnston, Powell, Brant, and Colonel Butler. Also adjacent stood the house of Asa Ransom, where in 1798 the first white female child in Buffalo, Sophia Ransom, was born.

House of Captain William Johnston, first permanent white settler of Buffalo, built in 1784. On adjoining land was the blacksmith shop of David Reese, appointed by the Government as blacksmith to the Seneca Indians. This shop was used as a morgue for the unfortunate victims of the fire on December 31, 1813.

Ancient Indian fort, more or less circular in form, and center point of the resettlement of the Iroquois nation after it had been driven back in 1779 by the Sullivan-Clinton Expedition. Here also were the original graves of Red Jacket and Mary Jemison until they were moved, the former to Forest Lawn and the other to Glen Iris. This, too, was the location of a Seneca Mission where the Reverend Asher Wright in 1831 printed scriptures, hymns, and spelling books in the Seneca tongue.

First school house in the village of Buffalo, 1807.

Shelton Square, early known as the Vil-

Above. **The first railroad station in Buffalo. It was succeeded by the Union Station on Exchange Street. Today a fine new station at Lovejoy Street houses the New York Central and the Pennsylvania. The Lehigh and the Lackawanna have their separate stations.** ***Below.*** **The twin pumps on the Terrace at Main Street, which was one of Buffalo's earliest sources of water supply. After a pumping station had been built and the water piped to the houses, many citizens continued to insist on drinking the pump water in preference to water in the conduits. "The pump water tasted right."**

lage Common, where Cyrenius Chapin and Seth Grosvenor with a few other villagers manned the old cannon in their futile attempt to obstruct the progress of Riall's forces when invading Buffalo, December 30, 1813. This was the site of the first St. Paul's Church, built in 1820. On adjoining land the first Presbyterian Church was built in 1823.

Old Richmond Hotel and St. James Hall. The latter was where President Lincoln's body lay in state in 1865.

Famous old Eagle Tavern, built in 1816. Among its famous guests were General Lafayette, Daniel Webster, and many other notables.

First Buffalo Court House.

Mrs. St. John's house which, along with David Reese's blacksmith shop and the jail, were the only buildings to survive the burning of Buffalo by the British in 1813.

John G. Milburn house where on September 14, 1901, President McKinley died.

Temple of Music where the assassination of President McKinley took place.

Home of first mayor of Buffalo, Ebenezer Johnson, 1833.

Fort Porter, named for Peter B. Porter. It was a military post until 1926 when it was abandoned. The only remaining building, the home of former commandants known as the Castle, is the headquarters of the Girl Scouts.

Site of a large triangular black rock jutting out into the river from which the early village of Black Rock took its name. This rock made a natural ferry landing, as its nothern edge was about 100 feet and extended down the river about 300 feet. It was blown up and destroyed in 1825 to make way for the Erie Canal. During 1812 old Fort Tompkins and several batteries were located in this vicinity.

Sailor's Battery in the old Scajaquada Creek Navy Yard. Here some of Commodore Perry's immortal fleet were reconditioned and refitted before the battle of Lake Erie.

Buffalo Historical Museum.

Buffalo, now boasting a population of 576,000, is 14th city in size in the United States. Situated at the junction of Lake Erie and Niagara River with an altitude of 583 feet, it has a most enjoyable summer climate and many attractions for the vacationist, among which are 11 large and many beautiful parks totaling 1,561 acres, including the Botanical Gardens at South Park, the new Zoo at Delaware Park, Civic Stadium, Delaware Park Lake, Albright Art Gallery, Buffalo Museum of History, Buffalo Museum of Natural Science, Kleinhans Music Hall, Buffalo Municipal Auditorium, many fine golf courses, and a yachting harbor at Centennial Park.

Buffalo is conveniently located, with rail, steamship, highway, and air connections to the most important centers of the United States. The Peace Bridge links it with Canada.

A most historic and interesting side trip from Buffalo by way of Niagara Falls is a visit to old Fort Niagara where plans were made for the most important battles of the Niagara Frontier. All the structures at the fort have been faithfully restored, with the help of many persons but mainly that of the late Colonel Morrow of the Fort Niagara Army Post.

Manpower

THERE is no recess for those upon whom has fallen responsibility with respect to manpower. The most discouraging thought is the slowness with which some officials learn the situation with which they must deal. Take, for example, the case of an inspector at one of the arsenals. This man, becoming eligible under the Selective Service Law, but meanwhile having demonstrated what he could do, was needed right where he was, doing defense work as an inspector. His superior officer asked the Colonel commanding the arsenal to do all he could to secure his deferment, that he might continue his important work. When told that he was performing the work of three men, the Colonel pounded the desk and said, "Then go and hire three men to take his place." When told that three men of proper qualifications could not be had, there was more desk pounding and something to the effect, "Don't tell me you can't hire three men. Get them." There is little that can be done in a case like that, and while profanity may ease your feelings and reduce the pressure, it does not get the three men.

Officials of the AMERICAN CHEMICAL SOCIETY and many individuals have worked hard and consistently on this problem, with no other motive than to see the best possible service rendered the United States. But there is much yet to be done.

With the permission of the author we have taken excerpts from some of his letters to various officials on this important subject. Doubtless others are doing similar good work, but we have not seen their letters. We regard such efforts of real service to the country. We hope by printing this material we, too, may have rendered some service and that the information conveyed may be useful alike to those who make the appeals and those who reach the decisions. As the war goes on and an increasing number of men are required by the combat Army, the problem becomes more urgent as well as more difficult. But we must remember that without adequate production to supply and support him the combatant is wholly ineffective. The excerpts to which reference has been made follow:

* * * We are certainly not making the best use of our manpower. This is not the Battle of Lexington. We need more than a bunch of men each with a musket and a few rounds of ammunition. We need more than the brave men of Bataan and Corregidor who die as heroes but lose because they do not have the proper backing. In the past few months there has been a hysterical tendency to build an Army of 7,000,000 or 8,000,000 men—an Army so large it would be utterly impossible to supply it with the tremendous tonnage of materiel necessary for a modern war, if it is to result in victory rather than merely in heroic death.

* * * General MacArthur said distinctly that "bravery is not enough".

* * * It is hard to get exact figures as to the number of civilians necessary to back up each fighting man in a modern war. Some give the figure as 10, others at 14, and a few as high as 17. These figures are based on the assumption that the civilians will supply materiel for their own fighting men. In the present war, we shall have to supply materiel not only for our own fighting men but to those of Russia, China, and even England if large numbers of British troops become actually involved in the war. Rumor has it that at the present time most of our TNT is being shipped on Lend-Lease. I have it on good authority in the case of another special high explosive that 90 per cent of the material produced will go to the British. This is as it should be. On the other hand, as our own Army expands, we must expand production facilities so that they can be backed up with materiel to the same extent that our chief enemy backed up his troops in Poland and in France. To do that will require more technical men than we have or can possibly produce. I maintain that any individual who willingly leaves chemistry, chemical engineering, or physics to enter the armed forces for nontechnical work is merely a complicated kind of traitor even though he may be posing as a patriot. Anyone who connives at such a loss to the national effort is merely abetting treason. * * *

* * * Fortunately for the country, there is not confusion in this matter in Selective Service Headquarters in Washington under the leadership of General L. B. Hershey. General Hershey and his colleagues in Washington understand thoroughly what kind of war this is and the importance of the word "selective". They have repeatedly emphasized the importance of keeping in technical work chemists, chemical engineers, and physicists, including those actually engaged in these fields, those in training, and even the instructors in these fields. * * *

* * * There is an increasing amount of uneasiness both among students of chemistry and among men actually engaged in professional chemical work. In many cases, the individual cannot see in what way he is actually helping the war effort. Many feel that they should leave chemistry and enter the combat forces in some definite way. A still larger group feel that they should go to work for the Government in a chemical capacity. Unfortunately both the Army and Navy, by various means, are giving the impression that they need chemists. The abovementioned chemists are listening to these pleas and are tending to answer them out of the faith that their professional training and experience will actually be used in the war effort. A reasonable guess is that over 90 per cent of such men in the Army and Navy are doing work which could be done just as well by ordinary liberal arts graduates with perhaps one year of freshman chemistry. * * *

* * * Practicing chemists come in two categories:

1. Those engaged in work directly related to the war effort. Incidentally this includes a great many things besides making munitions.
2. Chemists working in other lines.

These form our only chemical reserves. They should continue working where they are, in preparation for the time when greater numbers of experienced chemists will be needed and cannot be obtained in any way except by transfer from existing industries. In other words, the switch-over to war activity such as has taken place in the automobile industry will have to come in the chemical industry. When that time arrives, we shall indeed be in a difficult position if, meanwhile, large numbers of the necessary chemists are transferred into nonchemical work. * * *

* * * I keep an unusually close touch with the supply and demand of chemists because of my service during the middle of the depression as Chairman of the AMERICAN CHEMICAL SOCIETY'S Committee on Unemployed Chemists. Most emphatically, there are fewer chemists and chemical engineers available than at any time during the past 30 years. The situation is apparently getting worse each month. The new graduates of May and June did not improve the situation to any great extent for the simple reason that most of them were already hired in advance of graduation. * * *

* * * Whenever I get a chance, I am emphasizing two numbers—27 million and one quarter million. The first number corresponds to men in the Selective Service System up to 35 years of age. The second number is slightly greater than the present total enrollment of the National Roster of Scientific and Specialized Personnel which includes chemists, physicists, chemical engineers, bacteriologists, geologists, and other scientifically trained men from the graduating class of 1942 up to the age of about 80 years. If we lose the war, it will not be because of the 27 million but because either the quarter million is too small or we have not used it effectively. In this group there are about 60,000 chemists and chemical engineers. These are only enough to keep the country going in peacetime. For instance, at the very depth of the depression a detailed survey of the country showed that the largest number of unemployed chemists and chemical engineers was only about 900. The intense activity of modern industrialized warfare calls for a much larger proportion of technical control, direction, and research than is necessary in the more leisurely activities of peace. When the new plants for munitions, synthetic rubber, and the like are finished in 1943, the number of technical men needed to run them adequately will be far in excess of the available supply even with the diversion of those men still engaged in fields not directly connected with the war. * * *

* * * The production of chemists and chemical engineers at the four-year level with a B.S. degree and at the seven- or eight-year level with a Ph.D. degree will not be enough to take care of our increasing needs. There will probably have to be a mass transfer of chemists and chemical engineers from less essential industry into actual war industries. This will be possible without too much difficulty always provided that the chemists in less essential industries have not in the meantime been taken out of their chemical work and training and put in the Army. Of course, eventually we shall have to do as was done in the first World War—comb the troops and take from them every man with chemical training, but this is a most difficult and wasteful process. * * *

* * * General Hershey has repeatedly emphasized his understanding of this critical situation. We must still do our duty in the case of each individual man in helping the draft boards to decide whether he belongs in the 27 million or in the quarter million. * * *

* * * I have only one interest, namely the winning of this war in which we are involved. To that end, each of us must serve in the way his training and ability can be most effectively used. There will be hundreds of thousands of young men who have no wish to fight but will have to fight because that is the way in which they can best serve their country. On the other hand, there will be a much smaller group of men who would like to fight but who cannot be allowed that luxury because their services are needed elsewhere—whether they like it or not. Of course any healthy male would rather fight than work. If he has a reserve commission, he would naturally prefer to retain it and enter active duty when the time comes. That is the easy thing to do. His duty, however, is far different. I can say most emphatically that if he neglects to follow the plan of the War Department for the resignation of his commission because of the key character of his position, he will be just as much of a slacker as is the young man who refuses to fight when called upon to do so. * * *

* * * The argument as to the value of graduate training can be clarified by the fact that all of the great chemical companies do their best to get as many men with the Ph.D. degree in chemistry and chemical engineering as possible. They are willing to pay over twice as much in initial salary for these men as for men with only the undergraduate training. Of course, if anyone is pessimistic and thinks we are going to lose the war in a year or so, I suppose graduate training is not necessary. To me it is inconceivable that anyone can be so optimistic as to think that we can finally win the war in less than about 25 years. We may achieve some sort of an armistice in four or five years or even less but we certainly cannot relax and go back to our normal ways even at that time. We shall need more and more highly trained technical men. These can be obtained only through graduate work. * * *

* * * I must disagree with the feeling that few young chemists are really irreplaceable or hold so-called key positions. Many firms are discovering the fallacy of this reasoning after they have allowed some of their younger chemists and chemical engineers to be drafted with the calm assumption that they can be replaced. The answer lies in the fact that the total number available now and in the next few years is altogether inadequate. * * *

* * * I have recently run into the request from employers that I let them know of any sophomores or juniors who find themselves unable to continue under the speed-up program this summer. They would like to hire these men because of the difficulty of obtaining regular B.S. graduates. I don't know what we shall do to get technical men. We shall probably have to start taking those who have had even freshman chemistry. Since the shortage of chemists and chemical engineers has become so severe, we have had many requests for the names of students who have flunked out during the past few years so that they could be approached regarding chemical jobs. That is a situation which I have never seen before, not even during the shortage of chemists during the first World War or during the boom days of 1928. * * *

* * * Every possible effort should be made to train new men, preferably of over draft age, with definite dependents, or with physical handicaps, to replace men who have received a six-month deferment. If the replacement cannot be made during the first six months, every effort should be made to train a man to make the replacement by the end of the second six-month deferment. Such efforts should be made aggressively and in such a way that evidence can be presented to a draft board or appeal board showing the extent of the efforts. If, in spite of everything which can be done, such a man cannot be replaced, there should be *no hesitancy about insisting on further deferment* with a presentation of all the evidence as to the man's necessary position in the organization and the efforts which have been made to train or obtain a man for a replacement. If the local board refuses deferment in the case of such a necessary man, then an appeal should be made by the man immediately on the basis of his training and experience and the necessary nature of the work in which he is engaged. This appeal has to be made within 10 days of the date of the 1-A notice. He should immediately notify his chief of the appeal. If this appeal is lost he should appeal to his State Selective Service Board and should also send a statement of the appeal, together with his draft number and the address of his board, to any professional organization of which he is a member, such as the AMERICAN CHEMICAL SOCIETY and also the National Roster of Scientific and Specialized Personnel, in Washington, with a request that they give any help they can by writing to the local and state boards. It should be emphasized that the only matter involved is maximum effectiveness of the national effort. * * *

* * * Many groups are interpreting the requirements of the Selective Service System as indicating that there is no use in asking for a deferment after two deferments of six months each have been obtained. All possible should be done to convince employers that end is not the intent of the Selective Service. Of course, if an employer has made no effort to train a replacement or obtain a replacement during the year of deferment, he is in a poor position with the Selective Service System. On the other hand, if the man involved is necessary to activities intimately connected with the national defense, national health, or the national welfare—three things which I believe should now be grouped as the war effort—it is his duty to that effort to give the Selective Service System the evidence in the case. * * *

* * * I cannot think of any better set of rules than those developed by General Hershey and his colleagues. The one thing necessary is a job of education so that technically trained men will first of all recognize that the patriotic place for them is in their technical work and that they must do their part to protect the country by making an appeal in case their local board makes a mistake and attempts to remove them from the Army of Production, or from training for that Army, and places them in the Combat Army in which they can do less good. * * *

* * * Since Paul V. McNutt has now

instructed local boards to consult with the U. S. Employment Service offices, it is to be hoped that they will recognize the serious importance of proper use of all of our manpower, including the 250,000 scientifically trained men. I have been unable to get official figures to confirm this, but indications are that in Germany there are probably nearly twice as many technically trained men as there are in this country. That is for a population about two thirds of ours. Moreover, it does not include perhaps 100,000 technically trained men available in France. * * *

Society of Chemical Industry Elects Officers

FOSTER D. SNELL has been elected chairman of the American Section of the Society of Chemical Industry for 1942–43. Norman A. Shepard is vice chairman, Cyril S. Kimball, honorary secretary, and J. W. H. Randall, honorary treasurer. New committee members elected to replace retiring members are Edward R. Allen, Francis J. Curtis, Donald Price, Archie J. Weith, and Lincoln T. Work.

Preventing Poisoning Among Mercury Miners

DISCOVERY of a method of preventing mercury poisoning among miners was announced by Merle Randall, University of California. Miners exposed to the vapors of free mercury are sickened and disabled and can only work a few days or weeks where the exposure is great. Careful ventilation, previous best method of prevention, has never been entirely satisfactory.

Spraying the walls of mercury mines with a spray containing calcium polysulfide, Dr. Randall discovered, provides a coating through which the mercury cannot vaporize. This method has been tested over a period of 11 months, during which not a single case of mercury poisoning has been reported where the spray was used.

Foods Treated against Mold

DU PONT food experts estimate that over 18,000,000 pounds of cheese will be specially treated this year against losses from mold as part of the dairy industry's food conservation program. Adequate protection is necessary for the increasing amount of cheese being shipped abroad under Lend-Lease.

Swiss cheese, in common with many other foodstuffs, naturally contains propionate salts which act as mold retardants, it was said, but cream cheese and cottage cheese do not. So chemistry is coming to their aid with new inhibitors that can be added in the process of manufacture. The added mold inhibitors, now coming into widespread use, are said to cause no change in the flavor, texture, nutritional value, or appearance of the foods treated.

NECROLOGY

BLANK-STOLLER, INC.

C. R. Hoover

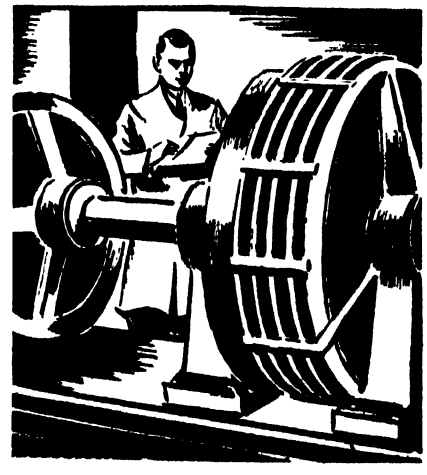
Charles R. Hoover
Laurence S. Moyer

WHILE flying on an experimental mission on the night of June 9, two naval blimps collided and fell into the Atlantic off Manasquan, N. J. Twelve of the 13 men aboard were killed, including two members of the AMERICAN CHEMICAL SOCIETY—Charles R. Hoover and Laurence S. Moyer.

Charles R. Hoover, professor of chemistry at Wesleyan University, was born September 30, 1885, in Oskaloosa, Iowa. He received the Ph.B. degree at Penn College in 1906, the B.S. from Haverford College in 1907, the A.M. from Haverford in 1908, and the Ph.D. from Harvard University in 1915. In 1909-10 he was professor of chemistry at Penn College, Carnegie Fellow at Harvard in 1912–13, and associate professor at Syracuse University from 1913 to 1915. In 1915 he went to Wesleyan University as associate professor, becoming full professor in 1918. From 1917 to 1919 he was chemist and consulting chemist with the Chemical Warfare Service. Since 1928 he had been consulting chemist for the State Water Commission of Connecticut. He had been chairman of the committee on laboratory construction and equipment of the National Research Council, and a member of the Connecticut State Board of Registration of Professional Engineers. He had done valuable work on atomic weights, gas analysis, catalysis, petroleum, laboratory construction and equipment, and trade waste disposal.

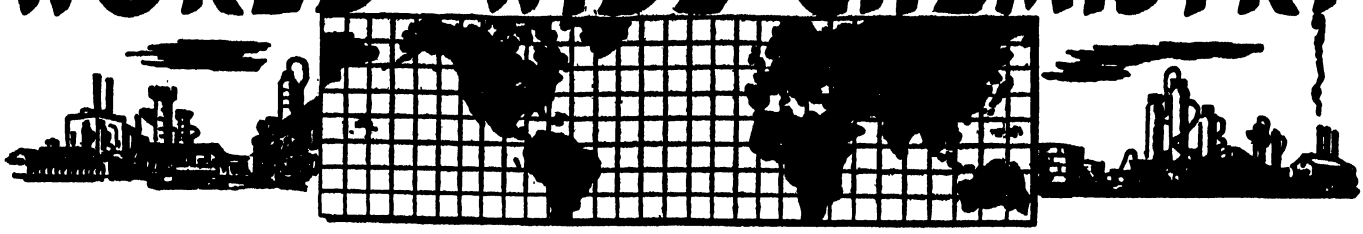
Dr. Hoover had been active in the AMERICAN CHEMICAL SOCIETY, which he joined in 1909, serving as divisional secretary, local section chairman, and local section councilor, and being particularly interested in the work of the Division of Water, Sewage, and Sanitation Chemistry. He was a member of the American Association for the Advancement of Science, Society of Chemical Industry, Institute of Chemists, Public Health Association, and New England Association of Chemistry Teachers.

Laurence S. Moyer, botanist at the University of Minnesota, was born in Philadelphia, Penna., July 4, 1907. He received the A.B. degree from the University of Pennsylvania in 1929 and the Ph.D. in 1933. From 1927 to 1929 he was assistant botanist at the University of Pennsylvania, assistant instructor from 1929 to 1933, National Research Fellow in agricultural biochemistry at the University of Minnesota from 1933 to 1935, and Sterling Fellow in public health at Yale University in 1935–36. In 1936 he went to the University of Minnesota as instructor in botany, and at the time of the fatal accident was serving as botanist with the National Defense Research Committee.



He was a member of the AMERICAN CHEMICAL SOCIETY, which he joined in 1938, the American Association for the Advancement of Science, and the Botanical Society. His principal interests were biochemistry, cell physiology, electrokinetics, properties of latex, sterols, bacteria, proteins, cells, and cell constituents; ionic antagonism, wetting properties of colloids, and physiology of plant cells.

Charles R. Owens



CHARLES R. OWENS, Ohio State University chemical engineer, was shot and killed in his classroom on June 11.

Dr. Owens was born in Columbus, Ohio, May 3, 1906. He received the degree of B.Ch.E. from Ohio State University in 1926, M.S. from the University of Michigan in 1931, and the Ph.D. in 1934. From 1927 to 1929 he was food analyst in the U. S. Department of Agriculture, was engaged in research for the United States Rubber Co., and from 1935 to 1938 was engineer with the Linde Air Products Co.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1927. He had done considerable work on heat transfer, and on construction materials, especially rubber, rubber substitutes, and plastics.

WORLD-WIDE CHEMISTRY

American experts in vegetable oils and fats recently visited the various oil- and fat-producing states of Brazil to study the possibilities of increasing Brazil's commercial production. A survey of probable commercial production of several derivatives was also discussed. Recommendations made by the American technicians will be further studied through the National Institute of Oils (Instituto Nacional de Óleos), a governmental research laboratory created to promote and to intensify the use and production of vegetable oils and fats obtained in Brazil.

Among the technicians who visited Brazil in March and April were George Jamieson, chief chemist, Division of Oils and Fats, U. S. Department of Agriculture; Charles Edmund, chief, Division of Oils and Fats, U. S. Department of Commerce; H. W. Valteich, director, Best Food Corp.; and Marvin Wood, president, Marvin Wood Co. The visitors were accompanied during their trips by the director and two assistants of the National Institute of Oils.

Group Organized to Establish National Standards to Meet

The Brazilian Standards Association (Associação Brasileira de Normas Técnicas) was created last year to unify the various standards established by industrial and official organizations and thus set up national standards. The new entity nominated technicians and experts to the first 20 committees in the fields of rubber; petroleum and its derivatives; coal; electric materials; vegetable oils and fats; plastic materials; minerals; ceramic products; cement; metal and other products for building purposes; leather and similar products; and nomenclature in engineering and chemistry.

The association is to meet once a year in different Brazilian cities, and the coming meeting will be held in Porto Alegre, State of Rio Grande do Sul, during October. The first committees appointed by the association have already started their duties and various standards will be submitted for discussion and approval at the Porto Alegre meeting.

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

Exports of Brazilian Bauxite Are Increased

According to estimates the 81 bauxite deposits existing in Brazil contain 150,000,000 tons of ore, and many of the surveys were made only to a very small depth. Although there are deposits in the States of Pará, Maranhão, Paraíba, Baía, Espirito Santo, Rio de Janeiro, Minas Geraes, and São Paulo, the reserves at Poços de Caldas, Pocinhos, and Ouro Preto are the only ones exploited on a large scale. While the aluminum plant to use Brazilian bauxite is being built, development of the deposits is confined to exportation, which was initiated in 1936 when 7,000 metric tons were shipped to Argentina. During 1939 exports of bauxite ore amounted to 18,279 metric tons, dropping in 1940 to only 82 metric tons. Shipments in 1941 totaled 14,365 metric tons and, it is hoped, in 1942 will set a record.

Brazil May Increase Sugar, Alcohol Output for U. S.

To the end of January 1942 production of sugar and alcohol of the last crop amounted to 18,246,036 bags (each bag corresponds to 60 kg.) of sugar and 87,009,490 liters of alcohol. Such figures show that the present 1941–42 crop will be superior to the previous one although restricted to actual market in accordance with regulations issued by the control organization, Sugar and Alcohol Institute. Rumors heard recently in Rio de Janeiro stated that the Brazilian Government was consulted by the American Government regarding possibilities of increasing production of both sugar and alcohol to take care of the shortage now existing in the United States.

Elimination of Tariffs in American Trade Advocated

President Vargas has approved a resolution issued by the Federal Council of Foreign Trade advocating the elimination of tariff burdens and obstacles to noncompeting products of the American countries, with a view of this being recognized as the established policy of inter-American political economy.

New Laboratories to Develop Native Products Inaugurated

Funds have recently been obtained for construction of the new laboratories belonging to the Instituto de Química de Sergipe, a research institute studying the development of products originated from the northern states. A branch of the Minerals Laboratory (Laboratório da Produção Mineral) was recently inaugurated in Campina Grande, State of Paraíba. Being an official organization controlled by the government, the new laboratory will carry out analytical and research work of mineral products from the north of Brazil, avoiding the delay in sending samples for analysis to the main laboratory in Rio de Janeiro.

Decree Sets Up Register of All Brazilian Industries

Considering the necessity of a sound program of industrialization, President Vargas recently promulgated a decree establishing the compulsory registration of all industrial firms and companies in the Industrial Register of the National Department of Industry and Commerce. The new law approved the registration card published with the decree on which all information related to capital, raw materials, products manufactured, number of workmen, technical staff, cost of operation, and other details will be furnished.

In another decree, President Vargas created technical classes and schools for workpeople, artisans, and apprentices and approved the regulations governing the schools and giving full details of the technical courses proposed. The first school will begin to function without delay.

Foreign experts will be brought to Brazil to cooperate with the government and the teaching authorities in developing the program established by the decrees. According to official statistics, the annual value of industrial production in Brazil increased from 20,013,000 contos de réis (about $1,000,650,000) in 1938 to 25,154,-

000 contos de réis (about $1,257,700,000) in 1940. Industries showing the greatest relative expansion were rubber manufactures, toys and games, paper and printing, tiles and building materials, iron, steel and metal goods, machinery, and apparatus.

C. E. Nabuco de Araujo, Jr.

Caixa Postal 970
Rio de Janiero
April 30, 1942

Rationing of foodstuffs, soap, and textiles and the gradual reduction of production in nonessential industries have been felt by chemical manufacturers supplying industries under quota restrictions, and it is likely that the decline of chemical requirements in these consuming trades will continue in the future. A new factor of increasing importance in this sector of the chemical trade is the introduction by the authorities of "utility" qualities of such goods as clothing, glass, and pottery. These "utility" goods require a minimum of essential raw materials and labor and will generally further reduce the demand for chemicals for nonessential purposes, thus freeing the larger tonnages required for the war.

In the field of dyestuffs the British Colour Council is sponsoring coordinated color ranges, designed in consultation with textile and other industries to effect the greatest possible economies and yet retain a wide variety of color schemes in all sorts of clothing. Colors which will be used for all "utility" materials conform to the Dyestuffs Controller's orders regarding maximum depths. Sufficient dyestuffs will be made available for the colors which are promoted by the British Colour Council, but the possibility of further retrenchment is not excluded.

Prices Fixed on Rutile Ore and on Graphite from Ceylon

The sale and purchase of rutile ore and concentrates, ground or unground, are subject to license. The Chrome Ore, Magnesite and Wolfram Controller will distribute the material to British consumers at fixed prices.

The Ministry of Supply has arranged to purchase the entire output of graphite in Ceylon at fixed prices which range up to 700 rupees a ton for best crucible lump. The ministry has also bought the whole production of copra and coconut oil in the island.

Calcium Is to Be Added to Wheatmeal Flour for Bread

While plans for addition of vitamin B to all white flour have been abandoned with the discontinuation of the sale of white flour and bread, the government is arranging for addition of calcium to the wheatmeal flour of 85 per cent extraction, which is now used exclusively. Seven ounces of calcium carbonate are added to each 280 pounds of wheatmeal flour.

New Pharmaceutical Product Produced on Commercial Scale

Production of ethanolamine oleate, which is used for the treatment of varicose veins without operation, is being undertaken on a commercial scale by a British manufacturer of fine chemicals.

Government Supports Sodium Hydroxide Application to Straw

The Ministry of Agriculture is supplying farmers free of charge with straw pulp plant to be used for the sodium hydroxide process to convert straw into an easily digested fodder. The method was developed by Imperial Chemical Industries.

Cornish Tin Mines Reopened in Government Drive to Raise Output

The first measure taken by the government to increase tin production in Cornwall was the provision of labor for existing mines. It is reported that three of the mines which had closed down have been reopened, and exploratory work proceeds with a view to the reopening of other mines which closed down because they were unable to compete on a commercial basis with tin production in the East. As the reopening of closed mines and other measures taken to increase tin supplies are bound to increase production costs, the Ministry of Supply has made financial arrangements with tin mining companies to bear the risk and cost of additional production.

Hydrogen and Sodium Zeolites for Water Softening

A combination of hydrogen or carbonaceous zeolites and sodium zeolites for water softening is recommended as a means of giving the final boiler feed any desired alkalinity. Water treated by the hydrogen zeolite process is likely to contain carbonic acid and sulfuric, hydrochloric, and nitric acids. Most of the carbonic acid is easily removed by passing the effluent water through a suitable aerating tower, while the remainder is effectively removed by an ordinary feed water heater or other means of deaeration. The mineral acids can be neutralized by adding measured quantities of sodium hydroxide to the treated water or by blending a suitable proportion of the effluent water from a sodium zeolite plant with the water from the hydrogen zeolite unit which contains some sodium carbonate and bicarbonate.

Three Refineries Built for Salvage of Waste Engine Oil

During the past few months three new refineries have been built for the salvage of waste engine oil. To avoid unnecessarily high costs, the Petroleum Board is organizing a scheme for the collection of used oil from garages. Users of transformer oil have been advised that considerable savings can be obtained if oxidation is reduced by sealing up, sufficient in the case of small transformers, or "breathing" from a nitrogen bottle when heavy loads alternating with light ones affect internal atmospheric pressure.

Control of Materials for Use in Refractories Progresses

Some important materials for use in refractories, especially important in wartime conditions, are subject to control. This applies in particular to chrome, while magnesite for basic linings must also be imported. Where high refractory power is required, aluminum oxide, either pure or diluted, may be used and, although it is rather an expensive material, it has made progress. For resistance to slag and abrasion a fused mixture of fire clay and alumina is recommended.

Recovery of Wool Fat Proves Asset in Wartime

Tens of thousands of tons of wool grease are recovered every year from the effluents of Yorkshire woolen mills. Although several important outlets had been developed before the war, wool grease has aroused more interest now that foreign raw materials are in limited supply. In English mills wool fat is removed from the wool by dilute solutions of soap and alkali at moderate temperatures. This process, which yields an emulsion along with the dirt and organic matters associated with it, is considered to be superior to solvent extraction as practiced in other countries.

In the usual method of recovery sulfuric acid is added to the wool scourers' suds in very large tanks to "crack" the soaps present and cause precipitation and coagulation of the solid matter and grease. The separated matter is collected for the pressing process after as much water as possible has been drained away. The grease is collected as a brown oil which, after boiling in vats and settling, becomes the common wool fat called "dégras" in the United States. It usually contains 10 per cent or more of free fatty acid.

While this process is used by mills with extracting plants of their own, the Brad-

ford Corp., which treats the effluent of some 50 wool-washing and combing factories in one plant, uses a somewhat different process. The "cracked" precipitated matters are, as H. Wontner-Smith and S. G. Campbell report in an extensive paper dealing with all aspects of production and use of wool fat, settling out as a sludge which is bottled up and filter-pressed. The soaps present are split up, and solid matters and grease settle out together in huge tanks covering 13 acres. The boiled sludge is separated in 160 cotton cloth filter presses into a solid cake away from large volumes of hot water still containing small quantities of grease. The average Bradford-recovered grease contains 29 per cent free fatty acids, 37 per cent combined fatty acids, and 34 per cent unsaponifiable substances. It is this material which is mostly used for industrial purposes.

Lanolin-Resin Solution Paints Used for Aircraft

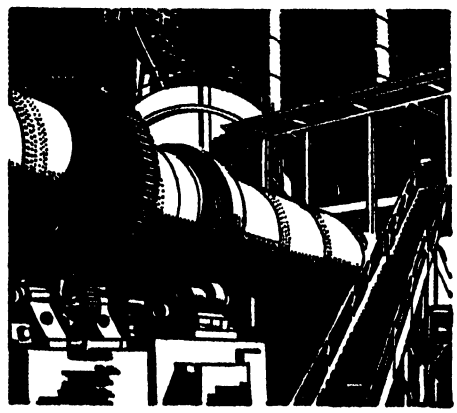
Among the many outlets for wool grease in the paint industry are pigmented lanolin-resin solution paints which have been investigated for the R. A. F. One of their special advantages is the formation of tenacious and durable protective films which can be applied in very thin coats. It was found that wool fat yields harder and tougher paints when mixed with beeswax, carnauba wax, high-melting paraffin waxes, or with resins. Drying can be accelerated by various treatments. The paints are usually applied in a solution in white spirit or solvent naphtha which, it is claimed, will give good service under the most unfavorable conditions for two or three years, even on bright steel work.

Shellac Research Develops Some Interesting New Outlets

Shortage of other materials and developments in research have attracted much attention to shellac, a material which has, for instance, been proposed for use in blackout paints. For other purposes a glossy, weather-resistant, air-drying varnish suitable for spraying can be obtained by using shellac with coal tar. The fraction of coal tar which distills between 120° and 300° C. is collected separately and combined with shellac. A simple process consists in heating the coal-tar fraction with sulfur and a vulcanization accelerator at 110° to 115° C. while passing a current of air, and mixing the product with a varnish of shellac in rectified spirit.

Another development reported by the Indian Lac Cess Committee is a process for extracting soft resin from shellac by using either single pure solvents or mixtures of solvents which alone would not have the desired effect, such as acetone and water or methyl acetate and glycol.

Blackout Experience Favors Bitumen Paints



While wool grease paints, usually of a cheaper type than the one previously described for protection of light metals and steel, have found considerable interest for blackout and camouflage painting, experience in England seems to favor bitumen paints. A solution of bitumen in solvent is dark and somewhat opaque even before incorporation of a pigment, but as the dry film is often rather brittle and prone to flaking, it is usually plasticized with linseed oil, lanolin, or stearin pitch. Manganese linoleate may be added as a drier, while clays are incorporated as matting agents. Further improvement of weather resistance can be obtained by inclusion of water-repellent greases or water-resistant resins. Gilsonite, dissolved in heavy naphtha and thinned with turpentine or white spirit, is said to be the most suitable bitumen.

Imperial Chemicals Issues Annual Report for 1941

The annual report for 1941 of Imperial Chemical Industries, Ltd., contains no details regarding production, but it is said that as a result of the pressure of the war for more production I. C. I. factories have worked to capacity throughout the year. Performance of the various plants, maintained at a high level, "testifies to the excellence of the equipment, the standard of maintenance which it is our practice to keep, and the technical control. The volume of output to meet demands has for a number of products touched new peaks."

The main manufacturing subsidiary or associated companies in the British Empire—I. C. I. of Australia and New Zealand, Canadian Industries, and African Explosives and Industries—have continued successful progress. The total gross income shown in the consolidated income statement is £19,956,000, compared with £19,016,000 in 1940, but owing to increased taxation the net consolidated income fell from £6,576,000 to £6,243,000.

Abolition of Gum Tragacanth Monopoly in Iran Is Foreseen

Abolition of the private monopoly on exportation of gum tragacanth in Iran is foreseen in reports to this country. This export is at present a monopoly held by a private organization. The plant producing the gum grows wild and is generally gathered on untilled public lands by independent workers who work when so inclined and are paid according to the sale price of the gum. There are no Iranian trade associations which have connection with the production, sale, or export of gum tragacanth, but prices are established by the monopoly.

Normal production is estimated at 4,000 metric tons, with local consumption scarcely exceeding 200 tons, in the absence of any industrial users. There are no public figures from the government, but stocks are said to be normal.

The United States, the most important purchaser, takes the better qualities of the gum, but European countries also share in the market.

U. S. Demand Aids Borax Industry of United Kingdom

Exceptionally active United States demand was listed as a factor in the profitable year enjoyed in 1941 by the United Kingdom borax industry. Profits of one of the larger companies, including subsidiary income, up to September 30, 1941, were said to have increased 17 per cent over 1940. Demand was steady throughout the year, and trade was maintained in markets of Europe and overseas that were still available, including the United States.

Sales in the domestic market are controlled to meet essential requirements and restrict nonessential uses. Prices were raised to cover increased freight and war risk insurance rates and other mounting costs.

Argentina Imports Total Calcium Carbide Needs

Argentina imports all of its annual requirements of calcium carbide, the consumption being reported as between 10,000 and 12,000 tons. Absence of local production is attributed to a lack of cheap hydroelectric power. Of 1940 imports amounting to 10,732 tons, 70 per cent were from Europe. In 1941, however, of imports amounting to 8,250 tons, the United States and Canada supplied the bulk and small amounts came from Brazil and Mexico.

Stocks of rosin and turpentine held in India in the last quarter of 1941 amounted to 1,956 and 402 tons, respectively. Production for the same period was 2,352 tons of rosin and 681 of turpentine.

Cuban Demands for Heavy Chemicals Gain

INCREASED demands for heavy chemicals for industrial use, tanning materials, sodium hydroxide, and allied products featured a more active chemical market in Cuba in 1941 as compared with 1940, according to a consular report. Although mounting textile production improved sales of dyestuffs, little gain was shown in the market for insecticides, and sales of arsenic sprays for tobacco plantations declined. Continued substitution of other materials in certain sugar production processes led to lowered sales of sulfuric acid.

Chemical Supply Short in Colombia

INABILITY of Colombian manufacturers to obtain chemicals is causing increasing uneasiness, according to local reports within the country. Shortage of soda ash in March caused a large glass manufacturer to curtail operations and lay off some workers, while the textile industry was also listed as feeling the lack of essential chemicals.

EGYPT offered a ready market for various chemicals from the United States in 1941, according to a consular report. Closing of former supply sources shifted sales to the United States, which had practically no part in the market before the war.

New Uses Devised for Tung Oil in China

CHINA, faced with curtailed foreign outlets for tung oil, one of its principal products, is putting it to new uses locally, according to a report of experiments conducted in that country. Tung oil is largely replacing kerosene in China's lamps, and factories near Chungking are reported producing a liquid fuel from this oil. It is being used for such diverse purposes as surfacing roads, in which it has been very successful, and in making oilcloth and lacquer polish.

Production and Container Costs Boost Alcohol Prices in Uruguay

HIGHER prices are in effect on alcohol for industrial, heating, and similar purposes in Uruguay incident to higher production costs and lack of tin-plate containers. Since glass demijohns are easily manufactured domestically, the price of alcohol in such containers has been below that of the same product sold in tin cylinders or drums.

Turkey Imports Dyestuffs from Great Britain, Germany

GREATER activity of Turkish textile plants, incident to decreased textile imports by the country, led to an expanded demand for dyestuffs during 1941. Great Britain and Germany supplied a total of 300 tons during the latter part of 1941, which eased a previous shortage. In the final months of the year Great Britain got over to Turkey an additional 270 tons.

Phosphates Shipped from Tunisia to Germany, Italy

TUNISIA is reported to be shipping 60,000 tons of phosphates per month to Germany and Italy. France itself has been unable to receive any from this province, at least in 1941. In that year Germany was cut off for the first five months, but thereafter monthly shipments were resumed. Shipments to Italy were made throughout the year. Of total shipments from Tunisia in 1941, amounting to 502,130 metric tons, Italy received 407,750 tons and Germany, 94,380 tons.

Sweden Turns to Norway and Germany for Fertilizer Needs

SWEDEN has been assured of a supply of fertilizers to meet the effect of several years of unfavorable weather and loss of grain supplies from abroad, according to official reports. Illustrating the difficulties encountered lately, imports of Chilean saltpeter dropped to about 1,600 metric tons in 1941, compared to an average annual import of 48,000 tons in the normal years 1935–36. Domestic apatite has been substituted in the superphosphate industry for raw phosphate, formerly imported and now unobtainable.

Sweden has drawn on the recently expanded industry of Norway for increasingly large amounts of nitrate of lime, imports of which jumped from the normal average of 60,000 metric tons to 120,000 in 1941, and has accordingly been able to maintain allotments of nitrogenous fertilizers to its farmers at peacetime levels. Use of nitrate of lime has proved successful except in cultivation of sugar beets, and the present supply of Chilean saltpeter, being reserved for that crop, is expected to meet this requirement for some time.

Potassium salts are being imported exclusively from Germany, peace-years imports averaging 80,000 metric tons but increasing to 90,000 in 1940 and dropping to 61,000 the following year. Shipments are routed by water from western Germany, and the difficulties are attributed to "severe weather" the past two years.

Output of Explosives in South Africa Expands

THE explosives industry is a leading factor in the development in South Africa of allied chemical industries, according to a report on the expanding output of explosives. The boom is due to the growing demand for fillers in bombs, grenades, small shells, and cartridges. At present production is so far in excess of domestic requirements as to make possible an export trade with other areas, especially Africa.

Monsanto Opens Phosphate Division Plant

Charles Belknap, executive vice president, Felix N. Williams, production manager, Phosphate Division, R. R. Cole, vice president and general manager, Phosphate Division, and Earl A. Tomes, Phosphate Division sales representative in the Detroit office, at the opening of Monsanto's new Phosphate Division plant in Michigan.

France Initiates New Chemical Enterprises

FORMATION in France of a new nitrogenous fertilizer company is reported from trade sources abroad. Of the 620 shares, 300 have been taken up by Kuhlman, 140 by Grande Paroisse, 100 by St. Gobain, and 60 by Produits Azotés. Most of these companies, it is said, have felt the adverse effects of shortages in raw materials and electric power and have been compelled to curtail production.

Several heavy industry firms have evolved plans for constructing extensions of by-product and fertilizer plants which, it is hoped, will provide supplies for French agriculture from chemical sources.

To make up deficiencies from loss of the potash mines of Alsace, a group is sinking a shaft in southwest France where potash deposits have been discovered. Production is scheduled to begin as soon as exploration work has been completed.

Canada Subsidizes Certain Mixed Fertilizers

CANADA is seeking increased production of foodstuffs by subsidizing certain types of mixed fertilizers used on crops of feed essentials in the eastern provinces. The object in part is said to be to relieve transportation lines of heavy shipments from the west.

Under the program fertilizers are not sold to any but bona fide farmers and cannot be resold, but must be used as directed by the local fertilizer board. The subsidy is not paid direct to the farmer. The amount of the subsidy is deducted from the invoice for the material as rendered to the farmer by the merchant. The latter is required to present proper proof of delivery, when he will be given the subsidy by the proper authorities.

PRODUCTION of nitric acid and methanol to meet domestic needs has been announced as a goal in Australia, where reports are made of plans to produce these requirements in four plants adjoining government explosive plants. Domestic needs of these two commodities are said to equal $3,200,000 annually.

ADDITIONAL Indian manufacture resulted in 1941 in a stimulated chemical industry. India, as a result of expansion of its pharmaceutical industry, is said to be remarkably self-sufficient in medical stores. Little progress was reported, however, in the dyestuffs and fertilizer industries.

SULFUR production in Guatemala has ranged from 15,527 kg. in 1938 to 12,350 in the following year and 10,775 in 1940. None was produced in 1941.

Reserve Hotel Rooms Now!

Buffalo Meeting, September 7 to 11

BECAUSE of the large demand for hotel rooms in Buffalo, it is imperative that reservations be made at the earliest possible date. Hotel Statler will be headquarters for the meeting and Hotel Lafayette for the Division of Rubber Chemistry. Official hotels and rates are listed in CHEMICAL AND ENGINEERING NEWS, June 10, page 720. Please make reservations immediately, using the form on page 725 of that issue. Location of the various hotels is shown on the map below.

POTOMAC POSTSCRIPTS

WPB Activities

Six chemicals have been placed under complete allocation control:

Order	Chemical	Date Effective
M-163	By-product ammonia and ammonium sulfate	June 1
M-164	Synthetic ammonia	June 1
M-165	Cyanamide	June 1
M-167	Capryl alcohol	July 1
M-168	Isopropyl alcohol	July 1
M-169	Methyl ethyl ketone	July 1

Orders M-163, M-164, and M-165 cover chemicals representing the principal sources of industrial and agricultural nitrogen and are likewise needed in large volume for manufacture of explosives. Capryl alcohol is used in the manufacture of certain synthetic rubber and coating materials, as an ingredient in lubricating oils, and as a fluid in hydraulic brakes. Amyl alcohol is now being substituted in brake fluids. Isopropyl alcohol is used chiefly in the manufacture of acetone, an important ingredient of explosives and plastics, though it is to provide other users with adequate supplies that Order M-168 is issued. Methyl ethyl ketone goes principally into materials which are used for protective coatings.

Certain forms are provided which must be filed with WPB, where they will be the basis for allocation. Under M-163 and M-165, Form PD-237 must be used; under M-164, Forms PD-237 and PD-504; under M-167, PD-525 and PD-526; under M-168, PD-521 and PD-522, and under M-169, PD-523 and PD-524.

Benzene goes under complete allocation control in an amendment of General Conservation Order M-137. Because of rapidly growing demand for benzene in making aviation gasoline, synthetic rubber, phenol for plastics, and aniline for the high explosive tetryl, the action was deemed necessary.

Persons seeking delivery of benzene and producers desiring to use benzene must make application on Form PD-223-A. Both producers and distributors must file Form PD-224-A.

Producers of benzene must operate their equipment to obtain the maximum quantity of two-degree benzene possible. The Director of Industry Operations may from time to time direct that maximum production of benzene of some other grade be produced. Sale is permitted of coal-tar derivative oils, petroleum oil not included, containing benzene only when the purchaser is prepared and equipped to extract the maximum amount of benzene possible. Further provisions of the order prohibit the use of benzene as a motor fuel, either pure or in mixture.

Beryllium. Complete allocation control over beryllium, alloying material used to harden copper, is ordered in M-160. Consumers must file requests for allocation on Form PD-496 by the 20th of the month preceding the month in which they wish delivery and must file a monthly report to WPB on Form PD-497. Until July 1, beryllium may be delivered without allocation to produce an article with a rating of A-1-c or higher. The bulk of the United States supply comes from Latin America.

Calcium-Silicon. General Preference Order M-20-a, which places calcium-silicon under complete allocation control, has been extended indefinitely. Calcium-silicon is a steel alloying material.

Cellophane. Use of cellophane has been further restricted by an amendment to Limitation Order L-20. The order as amended covers cellophane or other transparent cellulose sheets of 0.003 inch or less. The original order covered sheets of 0.005 inch or less. A new plastics conservation order is being drawn which will cover use of sheets over 0.003 inch in thickness. Further restrictions prohibit use of cellophane in window cartons, for carton overwraps, and for packaging animal food, rubber nipples, and candy.

Conservation of cellophane under this order is to avert a shortage of military and essential supplies, as well as to conserve some of the 50,000 tons of high alpha sulfite wood pulp, thousands of tons of sulfuric acid, large amounts of plasticizers, chlorine, glycerol, and caustic soda.

Chlorate Chemicals go under complete allocation control in General Preference Order M-171. The chlorate chemicals are used normally for making matches, fireworks, and explosives, as a weed killer, oxidizing agent, and rust preventive, and in chemical processes.

Persons requesting deliveries must file their orders with their suppliers, accompanied by Form PD-516, in the month preceding the month in which delivery is sought. Users of chlorate chemicals as a weed killer do not have to file Form PD-516 if they hold United States explosives licenses. Producers of chlorate chemicals must file Form PD-515 with WPB each month.

Coatings containing certain organic binders or pigments may not be used for coating steel containers of 2 gallons or greater capacity by the terms of General Conservation Order M-158. This order is expected to save nearly 1,000,000 pounds a year of critical oils and resins, which are needed for military purposes. Normally about 1,600,000 pounds each of critical oils and resins are used for drum coating each year.

The order divides coatings into two groups—Class A and others. Class A coatings—containing tung, oiticica, perilla, or dehydrated castor oils; alkyd, phenolic, vinyl, urea, or melamine resin; or cellulose esters or ethers—may not be used for drum coating except for export (other than Class A coatings containing tung or oiticica) or orders for the Army, Navy, Coast Guard, or Maritime Commission. No person shall apply any coating other than black, except for small areas of color for marking or legal requirements.

Cobalt-Nickel Oxide may be used in the manufacture of ground coat frit by terms of Amendment 1 to Conservation Order M-39-b. Consumption of cobalt in the manufacture of ground coat frit, an important ingredient in enameling of steel, was limited in any one quarter to 35 per cent of the amount of cobalt used in the first six months of 1941. The amendment permits use of cobalt–nickel oxide which cannot be practicably separated into cobalt and nickel and at the same time prohibits use of cobalt or compounds which can be so separated.

Laboratory Equipment. To help fill shortages in supplies of laboratory equipment and materials for its manufacture for the war effort, for private account, and for export, WPB has issued General Limitation Order L-144. For purposes of the order laboratory equipment means material, instruments, appliances, devices, parts thereof, tools, and operating supplies for laboratories or for use in connection with operations usually carried on in laboratories, not including second-hand items.

Sale, delivery, rental, purchase, and acquisition of laboratory equipment in which is used aluminum, chromium, copper, iron, magnesium, molybdenum, nickel, steel, tantalum, tin, titanium, any alloys of these metals, rubber, neoprene or other synthetic rubber, or noncellulose base synthetic plastics are forbidden, except pursuant to a purchase order or contract having certified on it a statement that terms of the order will be followed, signed manually or as provided in Priorities Regulation 7 by a duly authorized official. This certification, according to the order, shall constitute a representation to WPB and to the person with whom the purchase order or contract is placed that the subject matter of the order or contract will be used or sold in accordance with provisions of L-144. Every person concerned shall be entitled to rely on the certification,

unless he knows or has reason to believe it false.

No person shall make the certification unless the laboratory equipment is for one of the following uses:

1. Research on or production, analysis, or testing of materials.
2. Research by or for the Army, Navy, Maritime Commission, or any other department or agency of the United States Government or any foreign country entitled to deliveries under the Lend-Lease Act.
3. Training of personnel for the above agencies or government.
4. To the extent necessary for the replacement of essential existing equipment in laboratories affecting the public health and in United States government, state, county, and municipal laboratories.
5. To the extent necessary for repair parts and operating supplies for the maintenance of existing essential equipment and activities in laboratories.
6. For any use which the Director of Industry Operations, WPB, determines is necessary and appropriate in the public interest.

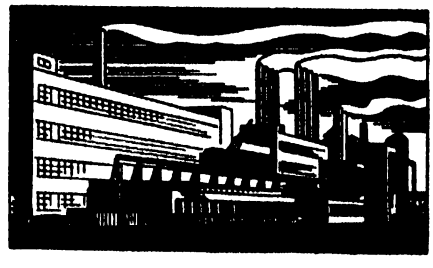
No manufacturer is to use any of the scarce materials described in the order where use of other material is practicable.

Persons to whom the order applies are to keep for not less than two years accurate and complete records concerning inventories, production, and sales, including copies of each purchase order or contract containing the certification required. Appeals may be made to WPB in cases believed working exceptional and unreasonable hardships. Communications concerning the order should be addressed to War Production Board, Safety and Technical Equipment Branch, Technical and Scientific Equipment Section, Washington, D. C., Ref: L-144.

Metals. Another step toward strict allocation of scarce materials and improved control of inventories was taken in an announcement that all but a few classes of companies requiring more than $5,000 worth of metal for the third calendar quarter of 1942 must apply for priority assistance under the Production Requirements Plan before July 1. More than 10,000 companies, including most of those handling large war contracts, will be required to operate under Production Requirements Plan by the terms of a revision of Priorities Regulation 3. About 7,000 companies are now using the plan.

It is anticipated that only the following classes of companies which will use more than $5,000 worth of metal in the third quarter will continue under existing procedures instead of under the Production Requirements Plan: producers engaged in primary production of basic metals; distributors; wholesalers; builders; companies engaged in transportation; utilities, including light, heat, water, and gas companies; mining companies and petroleum enterprises; communications, including telephone and telegraph; and companies engaged in sewage and drainage operations.

While preference ratings will be assigned under the Production Requirements Plan, the War Production Board will assign ratings only to delivery of the amount of material which it is estimated will be available during the quarter.



Platinum. WPB has taken steps to prevent Germany from getting any of the platinum she needs so badly for munitions production. All traffic in platinum except that conducted through normal, approved trade channels is halted by General Conservation Order M-162. Where transfer of platinum is permitted, the transaction, as well as inventories, must be filed with WPB on forms designated by WPB.

Platinum is a strategic material of war. That this country has adequate supplies is suggested by the 100 per cent operation of the platinum jewelry industry and the even course of platinum prices. Germany imported most of its platinum before the war, and it is now known that these sources are cut off, strengthening the belief that the German shortage is critical.

To prevent any American platinum being smuggled out of the country, or otherwise finding its way into the hands of our enemies, the present order forbids anyone to buy, sell, transfer, or otherwise dispose of any platinum (by which is meant any compound or alloy containing 1 per cent or more of platinum) except to a person known to the seller to be a dealer, distributor, processor, or consumer of platinum.

Resins. Restrictions on the use of natural resins in the manufacture of playing cards, pencils, house paint, label varnishes, toys, and farm equipment finishes are removed by an amendment to General Conservation Order M-56. The original restrictions were necessary because the demand then visible far exceeded supply. This situation is radically changed now, for restrictions placed on manufacture of many products by various other limitation and restriction orders by WPB have so far reduced general demand for natural resins that curtailment of end uses by M-56 is now considered unnecessary.

Styrene, one of the basic raw materials from which synthetic rubber is made, has been placed under complete allocation control. Producers are ordered to submit monthly delivery schedules to WPB by Order M-170. Purpose of the order is to ensure delivery of needed amounts of styrene to synthetic rubber plants without prohibiting the use of surplus styrene in the manufacture of plastics, such as combs, buttons, and certain types of electrical equipment. As styrene is not storable there is no need to restrict its use to the manufacture of synthetic rubber at present.

Tin. To provide additional tin for the urgent needs of military operations and civilian food supply, tin used in noncritical products will be cut another 10 per cent, effective July 1. This reduction plus certain others are contained in an amended version of Tin Conservation Order M-43-a.

The order as amended prohibits the manufacture and use of tin oxide except on orders carrying a rating of A-1-k or higher and restricts the amount of tin that may be used in solder and in printing plates. Certain imperative military and civilian operations were being jeopardized by restrictions in the original order. To avert an unnecessary hardship the order is changed to permit tinning of dairy implements, as defined in the order, to permit tin to be used in blasting caps for mineral extraction; babbitt for repair of certain Diesel engines; and repair and maintenance of ships for which a preference rating has been assigned by the Maritime Commission under PD-300. No restrictions in the order apply to the use of tin for implements of war (combat weapons and field service equipment) for the armed services, where such use of tin is required by service specifications.

Dyestuffs Antitrust Trial Postponed

ANTITRUST prosecutions of leading dyestuff manufacturers and their affiliates have been postponed because the trials would interfere with conduct of the war, Attorney General Biddle has announced. Secretary Stimson requested the postponement, explaining that the trial would take the time of executives and key production employees. Some of the defendants, he noted, are among the most important producers of war chemicals and other vital munitions and are operating numerous government-owned plants for chemical and explosives manufacture. This action was taken under the agreement, approved by President Roosevelt, Secretaries Stimson and Knox, and Thurman Arnold, Assistant Attorney General, that trials would be postponed if investigations showed it to be advisable.

Indictments were handed down against the dyestuffs makers in Trenton, N. J., May 14, by a federal grand jury. Corporations which will not have to stand trial are Allied Chemical & Dye Corp., E. I. du Pont de Nemours & Co., Inc., American Cyanamid Co., General Aniline and Film Corp., General Dyestuff Corp., Geigy Co., Inc., Sandoz Chemical Works, Inc., and Ciba Co., Inc.

Price Regulations

Antifreezes. Maximum prices for alcohol antifreezes will be established by the Office of Price Administration by mid-June at levels substantially below those now charged by some manufacturers, Price Administrator Henderson has announced.

As now contemplated by OPA, the regulation will hold manufacturers' prices to levels perhaps as low as 69 cents per gallon for high-cost-production alcohol antifreeze delivered by the carload in drums, container included. This ceiling would be approximately 10 cents a gallon under prices now charged by some manufacturers. The regulation also will probably set maximum retail prices at approximately 35 cents per quart for high-cost-production alcohol antifreeze and about 25 cents per quart for low-cost-production alcohol antifreeze.

The schedule will also cover ethylene glycol antifreeze solutions, prices of which have remained relatively stable at established levels.

Oleo. Uniform maximum prices for oleo stock, oleo oil, and oleostearin to all classes of buyers for any purpose are established by Amendment 4 to Revised Price Schedule 53 (Fats and Oils). Under the original provisions of the schedule, the maximums were the individual seller's highest price at which he did business on October 1, 1941, or 111 per cent of his November 26, 1941, sales price, whichever was higher. The new ceiling prices established reflect these peak levels, except that under the amendment they are to be uniform for the industry.

Specific ceiling prices set for oleo—packed in used drums or barrels, f. o. b. Chicago—in cents per pound are: extra oleo stock, 12.75; prime oleo stock, 12.50; extra oleo oil, 13.04; prime oleo oil, 12.75; and prime oleostearin, 10.61.

Copper Industry Featured by Record-Breaking Consumption

All-out aid to nations fighting aggression caused a sharper increase in demand for copper in the United States in 1941 than for almost any other large-tonnage material, according to the U. S. Bureau of Mines. Consumption, as measured by the use of primary refinery shapes, was considerably above all previous annual records. Failure of domestic production to advance in proportion to consumption and shipping restrictions foretold the need for contraction in civilian copper use.

Smelter production of primary copper from domestic sources during 1941 increased, as did total output of new refined copper.

Imports of crude and refined copper set a new annual record in 1941; exports of refined copper and primary fabricated shapes were almost the smallest of the century.

Third WPB Report Shows Increasing Scarcity of Materials

Increased momentum of the Nation's all-out war effort is reflected in the third provisional report on relative scarcity of certain materials, issued by the Conservation and Substitution Branch of WPB's Bureau of Industrial Conservation. The second report was printed in Chemical and Engineering News for May 10, page 607.

Forty additional items are listed in Groups I and II. Referring to previous lists, Harvey A. Anderson, chief of the branch, pointed out the tendency of many items to claim position in the higher brackets where demand exceeded supply. This change of position, generally due to depletion of supply through rising demands for the particular item, in some cases was brought about by the increasing deficiency of its substitutes. The third group is almost devoid of metals and chemicals. Most of its items are used with little change from the condition in which they are mined, quarried, or grown. Even where supplies are almost unlimited, certain varieties or grades have become scarce. In the case of large-tonnage items, problems of labor, manufacturing, and transportation have become increasingly important in making the materials available.

Group I. The available supply of these materials is inadequate for war and essential civilian uses and in many cases for war purposes alone

Metals

- Alloy iron
- Alloy steel
- Aluminum
- Aluminum pigments
- Cadmium
- Calcium-silicon
- Chromium
- Cobalt
- Columbium
- Copper
- Copper scrap
- Iridium
- Magnesium
- Manganese, electro
- Nickel
- Nickel scrap
- Rhodium
- Tantalum
- Tin
- Tinplate and terneplate
- Tungsten
- Tungsten carbides
- Vanadium
- Wrought iron
- Zinc, high grade

Chemicals

- Acetone
- Alkyd resins
- Alumina
- Ammonia
- Aniline
- Anthraquinone derivatives
- Benzene
- Butadiene
- Chlorinated hydrocarbon solvents
- Chlorine
- Cresols
- Diphenylamine
- Methyl methacrylate sheets
- Naphthalene
- Pentaerythritol
- Phenol
- Phenol formaldehyde resins and plastics
- Phosphates
  - Tricresyl
  - Triphenyl
- Phthalic anhydride and phthalates
- Polystyrene
- Polyvinyl chloride
- Sodium nitrate
- Sulfur chlorides
- Toluene

Miscellaneous Products

- Agar
- Asbestos, long fiber
- Babassu oil
- Burlap
- Cashew nut shell oil
- Chrome pigments
- Coconut oil
- Corundum
- Cotton
  - Duck
  - Linters
  - Raw, long staple
- Feathers and down, goose and duck
- Graphite, Madagascar flake
- Hemp
  - Agave fiber
  - Henequen
  - Manila fiber
- Hemp
  - Cordage
  - Seed
  - Sisal
- Jewel bearings
- Jute
- Kapok
- Kyanite
- Lumber, certain grades, hard and soft woods
- Mica, block
- Natural resins, except rosin
- Nylon
- Oiticica oil
- Palm oil
- Palm kernel oil
- Pig and hog bristles
- Quartz crystals
- Quinine
- Rapeseed oil
- Rayon, high tenacity
- Rubber
  - Chlorinated
  - Crude
  - Latex
  - Reclaimed
  - Synthetic
- Shearlings
- Shellac
- Silk
  - Row
  - Noils
  - Garnetted
  - Reclaimed
- Sperm oil
- Teak
- Tung oil

Group II. Materials that are essential to the war industries but the supplies of which are not so limited as those of Group I

Metals

- Aluminum scrap, No. 12, remelt
- Antimony
- Arsenic
- Bismuth
- Calcium
- Ferrosilicon
- Iron
  - Gray
  - Cast
- Iron
  - Malleable
  - Pig
  - Scrap
- Lead
- Lithium
- Manganese, ferro
- Mercury
- Molybdenum
- Palladium
- Platinum
- Ruthenium
- Silicon and alloys
- Steel
  - Bessemer
  - Carbon
  - Basic
  - Scrap
- Zinc, low grades
- Uranium

CHEMICALS

Alcohol
  Butyl
  Ethyl
  Methyl
Atebrin
Barium carbonate
Bleaching powder
Bromine
Cadmium pigments
Carbon tetrachloride
Citric acid
Formaldehyde
Glycol
Halogenated hydrocarbon refrigerants
Iodine
Lactic acid and lactates
Lithopone
Mannitol
Methyl methacrylate powder
Phosphorus
Potassium
  Perchlorate
  Permanganate
Sorbitol
Strontium salts
Tetraethyllead
Titanium pigments
Urea formaldehyde plastic
Vinylidine chloride plastic
Xylene

MISCELLANEOUS PRODUCTS

Albumin, blood
Bauxite
Castor oil
Cellophane
Cellulose nitrate, acetate, and other derivatives
Cork
Cottonseed
Cryolite
Diamonds
  Industrial
  Dies
Fish liver oils
Flax
Fluorspar
Glassine paper
Glues, animal and vegetable
Glycerol
Hides
Lead pigments
Leather
Linseed oil
Magnesite
Mercury pigments
Mica, splittings
Molasses
Natural gas
Parchment paper
Pine oil
Rayon filament, staple fiber
Rotenone
Rutile
Steatite talc
Tanning materials
Vitamin A products
Vulcanized fiber
Wood pulp
Wool
Zircon

Group III. Materials that are generally available in significant quantities as substitutes for less available materials

METALS

Gold
Indium
Osmium
Silver

CHEMICALS

Borax and boric acid
Camphor
Carbon black
Chromic acid for plating
Hydrochloric acid
Sodium metasilicate

MISCELLANEOUS PRODUCTS

Asbestos, common
Asphalt
Brick and tile
Casein
Cement, portland
Ceramics
Charcoal
Clay
Coal and coke
Coal-tar pitch
Concrete
Corn stalks
Cotton, raw, up to 1 3/8 inch
Cottonseed oil
Diatomite
Emery
Feldspar
Felt, hair
Flint
Gilsonite
Glass
Gypsum and products
Hair, cattle, calf, goat
Invert sugar
Kraft paper
Lignin plastic
Lime
Lumber and millwork
  Low grades, hard and soft woods
  All grades, gums
Mica, ground
Mineral wool
Paper, except II
Paperboard
Peanut oil
Petroleum products
  Crude oil
  Gasoline
  Lubricating oil
  Paraffin
Plywood, unrestricted binder
Pottery
Pyrethrum
Rosin and derivatives
Salt
Silica sand
Soybeans
  Oil
  Protein
Starch
Stone
  Granite
  Limestone
  Marble
  Slate
Straw
Sugar
Sulfur
Tripoli
Turpentine
Vermiculite
Wallboard
Wood and products
  Sawdust
  Wood fiber
  Wood flour
Zinc oxide, American process

Buffalo Conference on Examinations

September 5 to 6

THE success of national testing programs depends upon the joint effort of a large number of individuals and institutions, in both the construction and use of the examinations. A test must be representative of what is actually being taught; it must be of greater service to the professor using it than a test of his own construction.

In an endeavor to make the cooperative tests meet these requirements, a Conference on Testing is being sponsored by the Committee on Examinations and Tests, Division of Chemical Education, AMERICAN CHEMICAL SOCIETY. A very successful meeting of one week was held last year at the University of Chicago. This year a two-day conference, September 5 and 6, will precede the AMERICAN CHEMICAL SOCIETY meeting in Buffalo. Arrangements have been made for competent and trained leadership for each of the various groups. It is regretted that Sunday must be included but, because of the war, the time and expense involved are being reduced to a minimum. It is hoped that those interested in the national testing program or in the construction of tests in general, qualitative, organic, or physical chemistry will take advantage of this opportunity.

Chemists wishing to participate and to contribute to the actual construction of tests should select the subject of greatest interest and write to those in charge of the several groups:

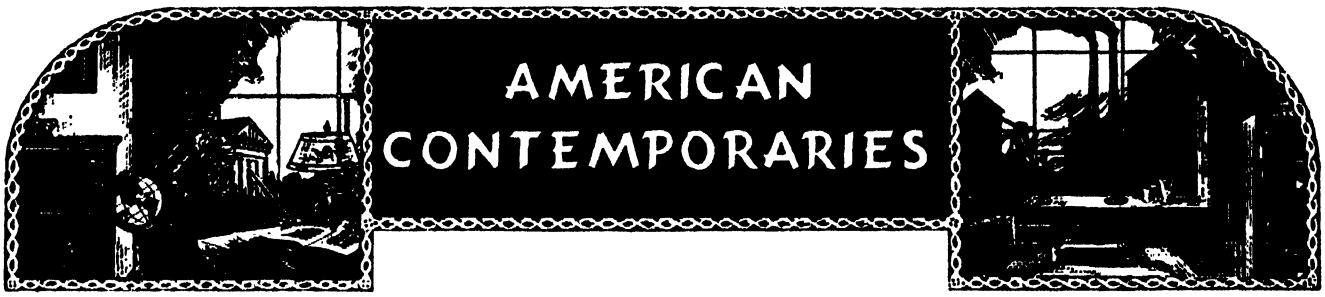
GENERAL CHEMISTRY
Application of Principles, F. D. Martin, Purdue University, Lafayette, Ind.
Scientific Method, Theodore Ashford, University of Chicago, Chicago, Ill.
Laboratory Technique, C. S. Adams, Antioch College, Yellow Springs, Ohio.
General Knowledge and Information, O. M. Smith, Stillwater, Okla.

QUALITATIVE ANALYSIS
Rufus D. Reed, State Teachers College, Upper Montclair, N. J.

ORGANIC CHEMISTRY
Ed. F. Degering, Purdue University, Lafayette, Ind.

PHYSICAL CHEMISTRY
Otto M. Smith, Oklahoma A. and M. College, Stillwater, Okla.

Haering Continues Growth



THE rapid rise of the D. W. Haering organization from one man in 1931 to a national organisation in 1942 playing a vital and substantial part in the industrial war effort is emphasized by the recent addition of several thousand feet of floor space to the Haering general offices on the 18th floor of the Engineering Building in Chicago.

Recent personnel additions include the appointment of Arthur J. Grotsma as controller, and Robert Seyl as director of service. Ilya Stephanoff, Mitchell Stanislaus Sniegowski, and Isabelle Luan, chemists, have been added to the laboratory staff.

Jack Daggett has been transferred from the laboratory to the field engineering department and John J. Meacher has been promoted to district manager of the new Cincinnati district offices.

UNIFORM containers for potassium salts are required under recent orders for control of fertilizers in the United Kingdom. Delivery of imported potash fertilizers to agriculturists is restricted to prevent unnecessary use.

A. Cressy Morrison

"MR. CHAIRMAN, who is the gentleman who seems to be the soul of dignity with whom you have conferred so often during the three days that this convention has been in session?"

"That gentleman, my friend, is Cressy Morrison, an elder statesman of the American chemical industries. He is a deep well of good council and sound judgment."

So spoke the chairman of the Executive Committee of the Organic Chemical Manufacturers Association to a new member.

It is hard for those who have known Cressy Morrison's active business life of more than three score years to think of him as having been born. His dynamic personality seems to have been here always. However, his advent into the world in the "wee hoose" in Wrentham, Mass., on December 6, 1864, was more than an ordinary occasion in the Morrison and Cressy families. Here at last was the "man child" to perpetuate their names and carry on the cherished traditions of their rugged Scotch ancestors. Abram Cressy Morrison, son of Abram Batchelder and Mary Elizabeth Morrison, has more than fulfilled the family expectations.

At a very early age Morrison exhibited the qualities of initiative, imagination, self reliance, and determination that have marked him as a leader in a wide range of activities. An older sister could hardly remember a time when he was not able to take care of himself. As a boy he was continually adventuring into new enterprises "on his own hook".

There was a family tradition that his great aunt "Jerushy", a Massachusetts farmer's wife, set out to stop a leak in a barrel into which the family pork was to be packed for the winter by filling the cracks with a concoction of applewood charcoal, ashes, sulfur, and lard. Much to her surprise she found yellow crystals in the mixture which were declared by a "Boston jeweler" to be "diamonds", but of no value because of shape and color. Inspired by the often repeated tale, 10-year-old Cressy decided to repeat the diamond experiment. After two days of persistent mixing and cooking and getting messed up from head to foot, he concluded that the family tradition was a bit unreliable.

At the age of 12 he bought for 5 cents a second-hand and dilapidated book by Robert Mudie entitled, "A Popular Guide

to the Observation of Nature", published in 1832 by J. & J. Harper. "This book", he said many years later, "was a wonderful revelation to me and I clung to it and reread it for years. It started me on a diligent and persistent inquiry into the wonders of nature and chemistry."

After a public school education and a year in business college, he secured a position with the Butler Rubber Co., Butler, N. J., where he not only became familiar with processes for manufacturing hard rubber products, but found his way of life in the field of applied chemistry. Thus began the industrial career of one of America's chief exponents of pandemic chemistry.

Although Morrison had never had a formal course in chemistry or physics he was quick to realize that the manufacturing processes with which he was working were based on them. He read everything on these subjects that he could find in the local libraries. Most of the available books dealt with the chemical aspects of physiology, nutrition, and medicine, but he found them so intensely interesting that he decided to work in those fields. He accepted a position with the Maltine Manufacturing Co. in 1888 where he made a special study of the production and use of malt extracts containing diastase, particularly their utilization as medicinals. In this work he became personally acquainted with more than 6,000 physicians. From them and extensive reading he learned much about practical medicine and its relation to the use of proprietary foods and medicinals. From them he also heard much about the Nation's dependence upon foreign-made drugs and pharmaceuticals, a matter which was to concern him much in later years. The new position gave him an opportunity to use his unusual natural talent for organization and promotion work. He liked people, trusted them, and understood them. They in turn liked and trusted him. News of his success spread rapidly. It came to the attention of Captain Fred Pabst, founder and president of the great Pabst Brewing Co. of Milwaukee, largest manufacturer of malt extracts in the country. Morrison was sent for. Would he take charge of development and publicity, not only for malt extract but also for all fermentation products including beer? What a question to ask a boy whose Puritan parents and forbears taught him that "trafficking in rum" was mortal sin and rum included everything from root beer to whisky! In fact, some straight-laced families of his boyhood community included vanilla extract which was reported to be an aphrodisiac. Morrison accepted the offer with the understanding that he was to have full responsibility and a free hand to introduce high ethical standards into the marketing of beer. It was a tough job. Established tradition in the industry presented almost insurmountable obstacles. In characteristic fashion he studied every angle of the business. He soon became familiar with the theory and practice of fermentation and an authority on the physiological characteristics and nutritional values of malt liquors and beers of various kinds. For the first time in the annals of American brewing, the public learned something of the fundamental facts that gave fermentation products real food values. The business grew by leaps and bounds. In addition to the extensive technical knowledge which he gained, 15 years in this work made him an outstanding expert in the field of public relations in industry.

Morrison has always been a prodigious worker—never satisfied with a single job. In addition to his work in the later years for Pabst, he was the executive in charge of the defense of alum baking powder during what was known as the baking powder controversy, one of the most vicious proprietary food product battles in our industrial history. It had much to do with the hastening of the pure food legislation of 1906. He originated the first

investigation of the physiological effect of the salts of aluminum on man and aided in bringing about governmental investigation of all baking powder. The two volumes of 1,100 pages each, entitled "The American Baking Powder Controversy", of which he is the author, are a monumental testimonial to his capacity to master thoroughly any task that he sets for himself.

In 1907 a young chemical company destined to become one of the giants of the American chemical industries was anxious to develop new uses for calcium carbide, its main product. Use of acetylene gas for general lighting purposes was growing but the electric light was a serious competitor. A vigorous development and public relations department was needed. Who was the man with the requisite experience, vision, initiative, and capacity for growth to head it? That the selection of Cressy Morrison by C. K. G. Billings and George O. Knapp, two of the founders of the Union Carbide Co., was a wise choice is eloquently attested by his 23 years of active service with that company.

Use of calcium carbide and acetylene by the general public involved hazards which were not understood by the layman. Morrison saw at once that if these hazards were not seriously to affect the use of these materials, regulations for their storage, transportation, and use must be put into effect. In cooperation with chemists, engineers, insurance underwriters, state and municipal authorities, and the Bureau of Explosives, he formulated the basic rules and regulations which govern the industry today, including the shipment of cargoes overseas. As a basis for these rules he investigated the physiological effects and the explosive ranges of acetylene and other hydrocarbon gases. These experiments included studies of the effect of poisonous and flammable gases encountered in coal and metal mines in connection with the use of acetylene for mine lighting. He served as secretary of the International Acetylene Association and received the Morehead Medal in recognition of his services.

The introduction and development of the oxyacetylene cutting and welding torch brought to the metal trades a new metal assembly tool and a new structural technique which rapidly increased the demands for compressed oxygen and acetylene. Widespread use of these torches in the form of mobile units necessitated the immediate formulation and adoption of strict regulations. Morrison was called to take charge of this matter for the industry at once. The basic rules and regulations which he prepared covering pressure generators, distribution in cylinders of oxygen and acetylene, design and tests of cylinders for compressed gases, and transportation and storage of the filled containers are the rules now adopted by the Interstate Commerce Commission.

In recognition of his outstanding accomplishments in this field he was elected president of the Compressed Gas Manufacturers Association. Production of oxygen by liquefying air and separating the component gases by fractional distillation was not so simple as it seemed. There were problems. They excited the inventive streak in Morrison's practical imagination. A study of the physical properties of oxygen and nitrogen led him to believe that their separation could be improved by carrying out the distillation in a strong magnetic field. Tests by the National Bureau of Standards confirmed this belief with the result that a basic patent was issued on the process.

The introduction of new chemical products for general public use often brings to the fore hazards which, if not understood and anticipated, create serious marketing difficulties. The organization of the Electro-Metallurgical Co. as a unit of the Union Carbide Co. brought forward the necessity of understanding the production and uses of ferroalloys, such as ferrochromium, ferrosilicon, ferromolybdenum, ferrotungsten, and others. Ferrosilicon in particular required special attention since gases injurious to human health emanated from certain grades during shipment and storage. Extensive studies of the physiological effects of these gases enabled Morrison to formulate the safety rules used today.

Production of a wide range of carbon products was a natural adjunct to the business of making acetylene, metals, and alloys. The National Carbon Co., another vigorous young member of the Union Carbide family, was extending its business in many directions. The proper guiding of its development needed a competent sales engineer to stand at the contact point between production and consumption. Morrison's long experience in similar critical positions enabled him to accept the new appointment with a full understanding of its responsibilities. Six months intensive study with competent experts gave him the necessary knowledge of the characteristics of carbon and the applied chemistry required to manufacture electrodes for illumination and electric furnaces, for the production of brushes adapted to the individual characteristics of motors, and for the manufacture of carbon and graphite for electric cells and lubricants. This work brought him in immediate contact with different kinds of industrial and public relation problems which were handled with the characteristic Morrison diplomatic finesse. His ability to step into new situations, acquire at once the basic and practical knowledge necessary to sense and understand the scientific, economic, social, political, and industrial trends, both domestic and international, that must be considered in the formulation and operation of sound production and merchandising policies for new developments in an industry as complex as that of the chemical industry, requires a vibrant and self-starting mind with a scope of comprehension that is possessed by few men. With the addition of Morrison's patience and strong sense of the responsibility to maintain high ideals in public and business morals, these are the requisite qualifications of the person who must stand as a buffer in charge of the control gates where the orderly rushing streams of scientific developments flow into the meandering sluggish rivers of society, lest they overflow their banks, to the detriment of the common good. Perhaps one of the reasons for the farsightedness that has been characteristic of Morrison's work has been his firm belief that laboratories engaged in fundamental research are the best "listening posts" for reliable information concerning the future course of industrial developments. For this reason he is also a staunch advocate of the necessity of membership in scientific and professional societies which support publications devoted to reporting researches in both pure and applied science.

In the early part of the first World War, Morrison discovered the British demand for helium. Through his interest in the production of compressed gases he was familiar with the pioneer work of Cady and MacFarland at Kansas University in the separation of the rare gases from midcontinental natural gas. He at once set in motion investigations which led to practical methods for the production of helium in this country. For this he was made a fellow in the New York Academy of Sciences.

Busy as Morrison's professional and business life has been, he has found time for public service activities. If he has an obsession, it is his unalterable belief that the future of the American Nation as the outstanding stronghold of democracy in this world depends upon free enterprise and a broad benevolent national policy for the development of industry. Accordingly he has been an ardent advocate of reasonable protective tariffs. His interest in the protective tariff dates from 1882 when the head master of a business school sent him to a course of lectures on free trade. He came out believing ardently in the vital necessity of an adequate tariff protection for American industry. He brought about the reorganization of the American Tariff League and became chairman of the executive committee, holding that position for 10 years.

In 1921 he organized and raised funds for the American Valuation Association which sought to have the values of imported articles on which tariff duties are collected based on the American values under United States jurisdiction rather than on the alleged wholesale values to be ascertained by our customs agents in the alleged country of origin. In this effort he succeeded in the House of Representatives which passed the necessary amendments to the Tariff Law, but the Senate cut out all but the present American valuation

requirements covering the coal tar paragraphs (27 and 28) where it has not only proved workable but without which much of our synthetic organic chemical industry could not have been built up or sustained. His work in revising and extending the chemical paragraphs has proved of primary importance to the United States and has become a foundation on which the synthetic chemical industry as a whole now rests. In view of the chaos ahead of us, with no foreign currency values and possibly forced labor, this work will continue to bear surprising relation to the continued success of the chemical industry if not torn down by impractical theorists.

He has frequently been called upon to serve on important government committees. During the years he was a member and particularly through the eight years he was chairman of the Chemical Advisory Committee of the United States Department of Commerce he rendered outstanding service.

One of the tenets of Morrison's credo is the conviction that the solution of many of the troublesome problems that bedevil mankind will be found in the discovery and understanding of natural laws. This means research. To stimulate fundamental investigation in the various branches of natural science he established in 1922 the A. Cressy Morrison Prize Competitions to be administered by the New York Academy of Sciences. Thirty awards have been made to date, totaling approximately $10,000. The papers selected for the awards, many of them by distinguished American scientists in astronomy, botany, chemistry, physics, biology, geology, zoology, etc., constitute important contributions to the understanding of fundamental laws in these fields. In recognition of his interest in research he was made a member of the executive committee of the National Research Council and president of the New York Academy of Sciences.

To his friends Cressy Morrison is a marvel of perennial youth and efficiency. They are astonished by the catholicity of his interests. How he ever found time, in addition to his other duties, during the Milwaukee years to collect and assemble the material for his large three-volume Encyclopedia of Superstitution is a mystery. It is the most complete work of its kind in the English language. Hobbies like this have had an important place in his life. His fondness for outdoor sports in the late 80's and early 90's made him an energetic cycling enthusiast, so much so that he became a distance racer who finished "within the money" in several 100-mile contests. He served two years as vice president of the American Wheelman's Association, an organization with 107,000 members. This led him to support a good road movement which was then being initiated. He introduced into the Wisconsin legislature the constitutional amendment which authorized the state to contribute to road improvements.

Since his retirement in 1930 from active duties with the Union Carbide and Carbon Corp. as executive in charge of public relations he has given his services generously to support scientific, civic, benevolent, and patriotic organizations. Under his presidency the New York Academy of Sciences expanded its activities and increased its membership greatly. While serving as its president he rejuvenated the old Institute of the City of New York. During the leanest years of the depression the fine work of The Chemists and Chemical Engineers Unemployment Committee could not have been continued without his generous support. In 1935 as chairman of the Finance Committee of the American Chemical Industries Tercentenary Celebration of the AMERICAN CHEMICAL SOCIETY in New York, he performed the Herculean task of raising the large budget requirements almost single handed. An outgrowth of his interest in this great celebration is the excellent memorial book, "Man in a Chemical World", prepared by him under the direction of the executive committee of the Tercentenary and distributed throughout the world. It was reprinted for the English Scientific Book Club, was translated into Polish as a textbook in Poland and into Portuguese for use in Brazil. A recent public service of much importance to the State of Maine, where he has a summer home, was his assistance in arranging for the construction of the $1,000,000 suspension bridge connecting Deer Isle with the mainland. Because of its unusual design, the local inhabitants refer to it with pride as "Morrison's hump".

Cressy, as his intimate friends know him, has had the good fortune to have at his side a tower of strength in the person of Mrs. Morrison, the former Marguerite Snow of New York, whose charming manner, sound advice, and sympathetic encouragement have contributed much to his success. Those who have had the rare good fortune to know them in the intimacy of their home where the simple graces of life abound have enjoyed unexcelled hospitality. To know Cressy at his best one must be invited to Spruce Harbor, his delightful summer home on Deer Isle, for a day's fishing with him in the sunlit waters of the coast of Maine. Then freely doth flow the charm of the true spirit of friendship from the soul of a free man ennobled by rich human experiences and by an abiding faith in his fellowman, his country, and his God.

Today in his 78th year, vigorous in mind and body with sense of humor undimmed, he goes daily to his office with a lilt in his step to work on the agenda of a program that will take several years to complete.

Such have been the achievements of an elder statesman of the American chemical industries and the course of life of a Massachusetts boy whose imagination was fired by his "Aunt Jerushy's" pork barrel experiment and who found time in a busy life to stroll in the pastures of wonder with pleasure and profit.

ARTHUR W. HIXSON

Paul W. Bachman has been appointed assistant research director of the Commercial Solvents Corp., Terre Haute, Ind. He was formerly manager of research and technical supervisor of phosphates for the General Chemical Co.

Paul W. Bachman

John G. Beach has been named a research engineer on the technical staff of Battelle Memorial Institute, Columbus, Ohio, where he has been assigned to the division of electrochemistry. Prior to joining the Battelle staff he was associated with the Sherwin-Williams Corp., Detroit, Mich.

Richard F. Bergmann has been appointed chief engineer for the Link-Belt Co., Chicago, Ill., and **William W. Sayers** has been appointed consulting engineer.

L. P. Biefeld has resigned his position as assistant professor in the Department of Chemistry, Purdue University, Lafayette, Ind., and is now associated with the Chemical Engineering Laboratory of the Owens-Corning Fiberglas Corp., Newark, Ohio.

William H. Browne has been named a research engineer on the technical staff of Battelle Memorial Institute, Columbus, Ohio, and assigned to the division of fuel research.

Ralph E. Burroughs, formerly director of

research of the Ingram Richardson Manufacturing Co., Frankfort, Ind., has been appointed assistant chief chemist of the Aluminum Co. of America plant at Lafayette, Ind.

John O. Burton has been appointed chief of research for the Minnesota and Ontario Paper Co., International Falls, Minn. Dr. Burton joined the company's staff in 1938 as research engineer.

Laurence H. Chase has been named a research engineer on the technical staff of Battelle Memorial Institute, Columbus, Ohio, and assigned to the division of organic chemistry.

Frank B. Cooper, formerly research chemist of the Western Pennsylvania Hospital Institute of Pathology, has joined The Zemmer Co., Pittsburgh, Penna., as director of research and control.

Frank Cowen, who will be a graduate assistant in chemistry at Purdue University next year, has been granted the Senior Award of a year's membership in the AMERICAN CHEMICAL SOCIETY by the Ohio Wesleyan Chemistry Department.

Appointment of **Reginald S. Dean,** chief of the Metallurgical Division, U. S. Bureau of Mines, to the post of assistant director of the bureau has been announced coincident with a streamlining of the bureau's administrative organization. The reorganization is aimed to make possible the utilization of newly developed processes to the fullest extent with a minimum loss of time.

George F. Kroha and **George C. Calvert** have been elected members of the board of directors of The Pfaudler Co. Both have been identified with the company many years.

John S. McAbee

John S. McAbee, divisional sales manager of the J. T. Baker Chemical Co., Phillipsburg, N. J., has joined the Naval Reserve as a lieutenant (j. g.).

Henry J. Masson

Henry J. Masson, professor of chemical engineering and chairman of the Department of Chemical Engineering at New York University, has been appointed assistant dean of the College of Engineering. Dr. Masson, also director of the college's Graduate and Evening Divisions, is an authority on petroleum, lubrication, explosive mixtures, and food technology.

Captain Harry Price, Infantry Reserve, a patent lawyer located at 420 Lexington Ave., New York, N. Y., has been called to active duty and is at present assigned to the Office of Chief of Ordnance, Research and Engineering, Social Security Building, Washington, D. C.

Rebecca Shapiro has resigned her position with the New York City Department of Health to head the Bacteriological Department of Foster D. Snell, Inc., Brooklyn. **S. S. Epstein,** who previously held the position, becomes vice president of Kirsch's Beverages, Inc., but will serve in a consulting and advisory capacity.

W. S. Shipley, chairman of the board of the York Ice Machinery Corp., York, Penna., was invited to be a member of the Honorary Advisory Committee on the occasion of the dedication of the new Technological Institute of Northwestern University on June 15 and 16.

James S. Strong, who previous to April 6 was the du Pont postdoctoral fellow at the University of Pennsylvania under Ralph Connor, is now at the Naval Research Laboratory in Washington, D. C.

Nathan Sugarman, Atlanta, Ga., majoring in cellulose chemistry, was the first to receive the doctor of philosophy degree from the Virginia Polytechnic Institute.

Frank M. Tiller, at present on the chemical engineering staff at the University of Cincinnati, will assume duties as assistant professor of chemical engineering at Vanderbilt University, Nashville, Tenn., in September.

Harlan L. Trumbull has been chosen by the B. F. Goodrich Co. to head a research project to study the present sources of rubber in North America and hunt for new materials.

Roger F. Varney received his Ph.D. in biochemistry at the University of Chicago and since the first of April has been employed as a staff chemist in the Biological Development and Control Laboratory, Biological Laboratories, E. R. Squibb & Sons, New Brunswick, N. J.

Robert R. Williams, chemical director of the Bell Telephone Laboratories, and **Roger J. Williams,** professor of chemistry at the University of Texas, received honorary degrees of doctor of science at the 188th commencement of Columbia University on June 2. In conferring the degrees Robert Williams was cited for "early taking a leading part in research in various fields including submarine cable insulation as well as the structure and synthesis of the antineuritic vitamin" and "a long record of accomplishment and distinction in an exceptionally helpful field of scientific inquiry", and Dr. Roger J. Williams for "giving nearly 20 years of scientific service to two institutions in the State of Oregon, winning distinction by most important contributions in the field of biochemistry, particularly by research as to vitamins with results which have great importance in medical chemistry".

BLACKSTONE

W. P. Yant

W. P. Yant, Director of Research and Development, Mine Safety Appliances Co., Pittsburgh, Penna., received an honorary degree of doctor of science from Wooster College on May 5. Dr. Yant graduated from Wooster College in 1918 and has since distinguished himself in the field of industrial safety and toxicology and has done much to eliminate hazards from gases, vapors, and dusts.

New Members Elected May 1 to June 1, 1942

Total Membership as of June 1—30,909

Akron Section. Grover Duke[1], Judson A. Fisher, Vincent W. Irle[1], Clyde H. Jones[1], William H. Parry, Jr.[1], Robert F. Thome[1].

Alabama Section. Carl Bordenca, Homer Carder, Malcolm W. Ellison, Jr.[1], Allen G. Erdman, Eugene Johnson, Eugenia Olivia Philabert[1].

Baton Rouge Section. Ralph T. Overman[1], S. D. Sumerford.

California Section. Elmer A. Anderson, Orvil Bolduan[1], C. P. Butler, Maxey F. Cobb, Matthew K. Fountain[1], T. H. Geballe[1], George Herbert Guenther[1], Elmer Huber, Jr.[1], Edwin L. Mitchell, Edward N. Squire[1].

Central Pennsylvania Section. A. S. Bewsard[1], Harold Hart[1], James Edward Holland[1], Samuel Kaufman[1], Laurence L. Layton[1], Robert A. Matteson[1], Max S. Peters[1], Adolf Von Hake[1].

Chicago Section. Harry A. Barron[1], Heins R. Berlt, Frederick W. Boebel[1], George E. F. Brewer, Juel Taylor Chapman, Francis G. Ginder, Jr.[1], Sherwin I. Ginsberg, Howard Wendell Hall, Sam S. Levin[1], Edward D. Mintzer, Peter J. Ronchetti, Herbert F. Schwarz, William P. Simmons[1], Charles V. Snell, Collins Veatch, Robert P. Zelinski[1].

Cincinnati Section. William J. Corbett, Jr.[1], Samuel G. Dent, Jr.[1], Albin H. Twardowicz.

Cleveland Section. Frank W. Buck, Claus Andrew Harwick, Robert C. Muhlhauser[1], Adelbert O. Tischler[1], Walter C. Warner[1].

Colorado Section. The Gates Rubber Co., Albert Optican[1].

Columbus Section. Frank L. Davison[1], Morris D. Farbman[1].

Connecticut Valley Section. Lucas P. Hart, Jr.

Cornell Section. Kimball P. Hall[1], Fredric W. Hill[1], James A. Robertson[1].

Dallas–Ft. Worth Section. J. W. Bartlett, W. E. Garrison[1].

Dayton Section. Harold W. Bell.

Delaware Section. Linus M. Ellis, Godfrey W. Wilbert.

Detroit Section. Thomas W. Baker, Donald L. Bishop, William H. Bishop, Benjamin B. Davis, Joseph Epel[1], R. V. Harris, C. Paul Huard[1], Charles A. Kumins, A. S. Miceli, Margaret L. Rosenberg, John M. Stewart[1], William J. Weisenburg, Albert W. Wilson[1].

East Tennessee Section. Aubrey R. McKinney.

Eastern New York Section. Andrew Aylies.

Erie Section. Don Martin Alstadt[1], Jerome N. Haimsohn[1].

Florida Section. John H. Gross[1], Charles R. Picker.

Georgia Section. Thomas S. Boggess, Jr., Moses E. Howell, C. Harris White.

Indiana Section. Steve Bunish[1], Charles L. Crump, Cornelius Gable[1], Paul R. Honan, Jr.[1], Leon L. O'Dell[1], Roger B. Smith, Paul W. Vogel[1].

Iowa Section. Harold A. Hoppens[1], Walter T. Howe[1], George Mahfous[1], Hubert C. Sullivan[1], Charles J. Thelen[1], Norman G. White[1].

Kanawha Valley Section. J. W. Mohlman, James W. Rimmer[1].

Kansas City Section. Louis J. Comaschi, Harry G. Fair[1], Carl E. Johnson[1], Ronald Pankrats[1], William M. Proudfit.

Lehigh Valley Section. Walter J. McCoy, Robert W. Noll[1], Ralph M. Yeager[1], Robert S. Yost[1].

Louisiana Section. Lawrence E. Brown[1], Reuben O. Feuge[1].

Louisville Section. Robert Neiman.

Maryland Section. Nis Hansen Skau.

Memphis Section. Norman Ellis, Edw. F. Smith[1], John D. Tucker, Jr.[1].

Michigan State College Section. Aubrey M. Bacot, James Goodrich Renno, Jr.[1], William H. Willert[1], Merle M. Woodward.

Mid-Hudson Section. Leon Donn.

Midland Section. Fred Andriessen, Raymond H. Rigterink[1].

Milwaukee Section. Roland O. Bartels.

Minnesota Section. David M. Libera[1], Robert Nordgren, Alton V. Oberholtzer, John F. Zalar.

Montana Section. Charles N. Caughlan.

Nebraska Section. Andy Isaac Jordan[1], Fred W. Staton[1].

New Haven Section. Edward N. Case[1], Bernard Kipperman[1].

New York Section. Sidney Braverman, Sarkis M. Casparian[1], Samuel A. Coleman, Colgate Craig, Marie M. Daly[1], Leonard Fine[1], Daniel E. Finkel, Leonard J. Fliedner, Leslie B. Gillie, Herbert D. Gray[1], Murray Guttenplan[1], Howard C. Haas[1], William H. Hoffman, J. Laurence Hutton, Jr.[1], Irving H. Kosofsky[1], S. Morris Kupchan[1], Victor Levine[1], Harry Linkletter, Robert T. Loughran, Justin J. McCarthy, William E. Manring, Herbert Meltser[1], Martin Murray[1], Herbert J. Passino, Monroe B. Petersen, Isidore Pollack[1], Martin H. Quell, Jerome L. Rosenberg[1], Stanley S. Rosner[1], Abraham I. Sawelson[1], Robert S. Sellers, R. E. Thrush, Christian Weaver, Arthur W. Wells.

North Carolina Section. James Scotten[1], David M. Weatherly[1].

North Jersey Section. George W. Apsey, Jackson J. Ayo, Jr., Forrest M. Batson, Robert E. Clayton, Jr., Harry H. Dooley, Jr., Walter S. Konwiser, Albert E. Merwin[1], Vincent F. Mistretta, Thomas W. Newell, Purity Drug Co., Inc., John W. Wilson.

Northeast Tennessee Section. Hugh J. Hagemeyer, Jr., Forrest D. Pilgrim.

Northeastern Section. Nikolai N. Belaef, Rowland S. Bevans[1], Marron W. Fort, Vlasios Georgian[1], Jerome G. Kuderna, Jr.[1], Harry O. Kulberg, Rufus Lumry[1], Albert B. Meservey[1], Alan M. Milman[1], Ralph T. Nassaro, Elaine Spencer[1], John J. Tyner, Jr.[1], Wilfred K. Wilson, Milton Yusem[1].

Northwestern Utah Section. Farrin L. Mangelson.

Oklahoma Section. D. Robert Brown[1], Virginia Joosten[1], Charles S. Moore, Howard R. Sailors[1].

Oregon Section. William H. Evans[1].

Panhandle Plains Section. Paul H. Wilhelm[1].

Pennsylvania–New York Western Border Section. Forrest Cummings, Peter V. Straub[1].

Peoria Section. Lawrence E. Glendenin[1].

Philadelphia Section. William B. Brooks, Joseph A. Dixon[1], Samuel Heiman, John F. McKinney, Jr.[1], Vernon J. Patterson[1], Richard F. Pierce-Ruhland[1], Albert B. Sample, Murray Louis Schwartz[1], Samuel Sirott[1], Robert E. Slack[1], Leonard J. Wissow[1], William J. Zelnick.

Pittsburgh Section. Paul V. Bardsil[1], Donald J. Cassidy[1], Clair C. Catherman, Charles S. Cole, Jr., Wilder D. Foster, Sister Miriam Grace, James L. Herbertson[1], Jonathan R. Learn[1], David L. G. Locke, George P. O'Donnell[1], Mae H. Oettinger[1], Raymond C. Provost, Jr.[1], Edward O. Tabor, Jr.[1], James E. Watson, Jr.[1], Zane O. Wilson[1].

Puget Sound Section. Norman L. Armstrong, J. Bayard DesCamp[1].

Purdue Section. Robert O. Bolt[1], Paul L. Breyfogle[1], Marjorie Rogers.

Rhode Island Section. R. M. Hainer[1].

Rochester Section. Charles W. Conrose, Ival Otis Salyer[1].

St. Louis Section. Donald B. Alnutt, Vincent R. Ameiss[1], Otto H. Eble, Clarence M. Hyslop, Isadore Kowarsky, Elly T. Margolis, Harold F. Ory, Harry U. Rhoads[1], Hartien S. Ritter, Laurence P. Russe, Krsta Tchossitch, Ralph G. Verdieck[1], John William Vogt, Ralph Wehrmann[1], W. Wayne Wheelhouse.

San Diego Section. William N. Drew.

South Carolina Section. T. G. Crawford.

South Jersey Section. Raymond A. Dunphy, Mack F. Fuller[1], Robert M. Girdler, William A. Hodes, Bernard Moss, Leslie A. Robb, Al. B. Wester, Jr.[1], S. Carroll Young[1].

Southeast Kansas Section. Robert A. Ewing.

Southeastern Pennsylvania Section. Malcolm Finlayson[1], Joseph Gliksman[1].

Southeastern Texas Section. Kenneth E. Coulter[1], Ethyl-Dow Chemical Co., Texas Division, Forrest G. Houston[1].

Southern California Section. Richard Bledsoe[1], Homer Jacobson[1], John R. Pownall, Roger T. Robinson, Herbert G. Sturz, R. W. Sutton.

University of Illinois Section. Harry Cade[1], James A. Robertson[1], Bernard H. Velsen[1].

University of Michigan Section. Nydia B. Goetz[1], Malcolm Smith Katz[1], Farrand D. Parker, Tudor L. Thomas[1].

Virginia Blue Ridge Section. James A. Beckett[1], Lewis E. Thomas, Jr.

Washington Section. Daniel Frishman[1], J. Halmer Hayner, Henry M. Pauley, Jr., Somers H. Smith, Jr.[1], Samuel Soloveichik, Edward Walton[1].

Western Connecticut Section. John A Mojcher[1].

Western Maryland Section. John A. Pursley[1].

Western New York Section. Dean DeForest Crandell, Robert C. Haring, F. Noel Hopper, Bernard Kopelman[1], Stephen N. J. Rubach, Curt Rupe[1], Arthur T. Schramm.

Western Vermont Section. Ellen F. Birchall[1].

Wisconsin Section. A. J. Krombholz, E. H. LeMense, Carl Piper.

No Section. Albert P. Centolella, Premo Chiotti, Comite Special du Katanga, Ramon A. Gadea, Jr.[1], Walter L. Gardner, Marcus J. Graham, William F. Griffin, Jr.[1], Orieda Horn[1], Frederick A. Krone[1], Angelo F. Lucadamo[1], Robert C. McGlenn, Louis Nagel, Raymond B. Purdum, Albert William Reed, Russell F. E. Schwetye[1], Carroll F. Shukers, George L. Somer[1], Robert L. Van Voorhies, Janet Vernon, W. H. Welch[1].

[1] Junior member

Cooperative Search for Substitute Retread

THE tire committee of the automotive and rubber industries has announced hope in its search for a substitute chemical material suitable for retreading work tire casings. The committee is an offshoot of the War Engineering Board of the Society of Automotive Engineers, and its membership includes representatives of automobile, rubber, and chemical companies: James Zeder, chairman, Chrysler Corp., Charles F. Kettering, General Motors Corp., and James M. Zeder, Chrysler Corp., representing the National Inventors Council; J. M. Crawford, Chevrolet, R. H. McCarroll and E. F. Wait, Ford, W. M. Phillips, General Motors Research, W. J. McCourtney, Chrysler, E. B. Babcock, Firestone, S. M. Cadwell, U. S. Rubber, R. P. Dinsmore, Goodyear, and Howard E. Fritz, Goodrich, as well as representatives of the Dunlop Rubber Co., Seiberling, General Tire, Hercules Powder, du Pont, Monsanto, Union Carbide & Carbon, Standard Oil of New Jersey, Dow, and Thiokol.

The committee has studied many chemical materials and narrowed the field of possibilities. A preliminary report has been prepared, and a complete report on available materials will soon be made to the Government. The cooperating companies have laid bare their secrets and many suggestions have been received from both technical and nontechnical men on how to solve the tire shortage.

WIDE WORLD PHOTOS, INC.

Goodyear Opens Chemigum Addition

The first batch of Chemigum, synthetic rubber made by Goodyear Tire & Rubber Co., rolls from the intricate maze of reactors and tanks in the new government-sponsored addition to the Goodyear plant. The addition started operation May 20, with still another government-sponsored addition scheduled for completion later this year.

Chemists Flash at "Flash of Genius"

INSPIRED by Thomas Cifelli's article "'Flash of Genius' Patent Doctrine and the Chemist", published on page 523 of CHEMICAL AND ENGINEERING NEWS for April 25, are these comments to the Editor. E. Ward Tillotson, assistant director of Mellon Institute, Pittsburgh, sends a clipping from a Kansas newspaper:

The following is from the transcript of a patent-law case given to the St. John Capital by Frank Richey, a patent attorney, who handled the case.

Question: How did you happen to invent your wrench?

Answer: Well, a Dago fellow reported to me that the nut on the second cut-off in the third slit was stuck. I tried a monkey wrench and it broke. I then tried a gas wrench and the teeth tore out. I then lashed a pipe onto the nut and two Negroes and this Dago strained on it until they busted the pipe. I tried to drive some grease between the threads with a high-pressure grease gun, but the grease recoiled and curled up on the top of the nut. I then tried to drill the nut loose, but the drill broke. It was then half-past eleven at night, so I went home, had me a double rye highball with a beer chaser and then sat down and invented my wrench.

P. J. Gaylor, 1094 Battle Hill Terrace, Union, N. J., writes:

There has been some criticism that the present courts favor the "flash in the pan" genius. It is very impressive to show that the inventor suddenly awoke in the middle of the night, dashed down into the cellar in his pajamas (almost breaking his leg by tripping over the wine barrel), put the frying pan over the old gas stove, and then and there melted down the four ingredients in the correct proportions to concoct his new and novel radiotherascopic alloy. On the other hand, if a recognized scientific worker in a large research organization had in mind making something of that sort and then proceeded methodically to melt up first A and B, then A, B and C, and finally A, B, C and D on the basis of his previous findings and logical deductions, then it is obvious that anyone skilled in the art could have done it.

Such a viewpoint, of course, could be reduced to somewhat of an absurdity. One can argue that there are merely about 40 readily available metals in existence, all known. If one required a metal for a particular purpose, all he need do is to start with aluminum and follow through to zirconium. If none of these gave the required effect, he could then begin on combinations of these, and test each one so that eventually, and without the exercise of any unusual skill, he would be bound to find the right combination, if there is one. Thus, one can conclude that there would be no invention in developing a specific alloy for any purpose.

From Jerome Alexander, 50 East 41st St., New York:

I emulated Edison,
And tried a thousand ways.
They failed—I tried a thousand more,
But still was in a haze.

My money went, my health went, too,
But research held me fast,
Till test eleven forty four
Brought me success at last.

I sued to stop infringers
Of my patent, dearly won.
The court said: "All you did was *work;*
Your patent's no good, son.

"If you had only gnashed your teeth,
Like Hitler, gnawed the rug;
Or pulled some psychiatric stuff
To prove that you're a 'bug',

"Or thrown a fit, or done a deed
That left your comrades pallid—
We'd see a *flash of genius*—and
Your patent would be valid."

Oil Company Denies Opposition to Rubber from Alcohol

THE report that petroleum companies have been fighting the making of tires from grain alcohol so that they can have the synthetic rubber field to themselves is denounced in a statement issued by Edward G. Seubert, president of Standard Oil Co. (Indiana).

Standard of Indiana has taken no such position and does not believe that other companies have done so, Mr. Seubert said. He added that at government request his company is preparing to produce material from petroleum for the manufacture of butadiene, one of the raw materials from which synthetic rubber can be made, as well as to help manufacture the butadiene itself.

"We do a great deal of our business with farmers", Mr. Seubert pointed out. "We should like to see them having a hand in supplying the raw materials for rubber. More rubber will make it more possible that civilian automobiles can be kept running. And the more they can be kept running the better business will be for the oil companies. It just does not make sense that the oil companies should oppose any kind of manufacture of rubber. Whatever the difficulties about manufacture of rubber from alcohol may be, monopolistic designs by oil companies are not among them."

Summer Course in Photoelasticity

THE Department of Mechanical Engineering, Massachusetts Institute of Technology, Cambridge, Mass., is offering a summer course in photoelasticity from July 27 to August 7, 1942. Inquiries should be addressed to W. M. Murray, Room 1-321.

Who Makes It?

SOURCES of the following chemicals are wanted by the National Registry of Rare Chemicals, Armour Research Foundation, 33rd, Federal, and Dearborn Sts., Chicago, Ill.: ethylbenzoyl formate, phosphorylcholin, diallyl acetic acid, guaiacol glyceryl ester, and sodium iodoplatinate.

The Columbia University Organic Laboratories are seeking a source of 100 to 500 grams of erythrose. Replies should be addressed to Marston T. Bogert, Belgrade Lakes, Maine.

Northwestern's Technological Institute Dedicated

(For photographs see pages 808 and 809)

WITH the world turning to technology more than ever before, Northwestern University dedicated its new $6,735,000 Technological Institute June 15 and 16. Extensive research and training for the war effort are already going on within the new building.

Engineering during the war and afterward was the theme of the dedicatory ceremonies. Principal speakers included Alfred H. White, president, Society for the Promotion of Engineering Education; Roger Adams, chairman, Department of Chemistry, University of Illinois; Henry T. Heald, president, Illinois Institute of Technology; William S. Knudson, advisory, War Production Board; Donald M. Nelson, War Production Board; Charles F. Kettering, president, General Motors Research Corp.; Robert C. Disque, acting president, Drexel Institute of Technology; William F. G. Swann, director, Bartol Research Foundation of the Franklin Institute; George O. Curme, Jr., vice president and director of research, Carbide and Carbon Chemicals Corp.; Karl T. Compton, president, Massachusetts Institute of Technology; and Jesse H. Jones, Secretary of Commerce. Kenneth F. Burgess, president of the Board of Trustees of Northwestern, presented the keys of the building to Ovid W. Eshbach, dean of the new institute.

Created through a gift from Walter P. Murphy, the institute was opened in 1939 and moved into its new building last fall. Cost of the structure was $5,000,000, and more than $1,000,000 worth of equipment is in use. When fully under way, the institute will have an enrollment of 800 men in a five-year cooperative course which calls for alternating three-month periods of study at the institute and work in industry.

Wheelco . . .

PROPORTIONING TEMPERATURE CONTROL

can be combined with any "Radio Principle" Controller

Proportioning Control, incorporated in one of the famous Wheelco "Radio Principle" Potentiometer, Pyrometer, or Thermometer Controllers, shown at right, gives you the closest temperature control possible with any of these types of instruments, regardless of price.

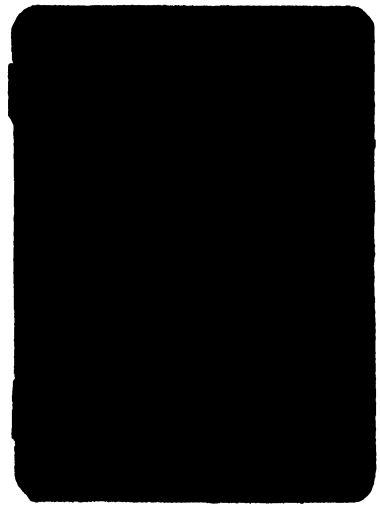
Wheelco Proportioning Control is an electrical device which provides continuously variable fuel input to maintain constant temperature. It eliminates the complicated and expensive balancing equipment usually required for "hair-line" control.

The unique superiority of this Proportioning Control System is available for a small addition to the low initial cost of a Wheelco Controller.

Complete description of Proportioning Control is given in Bulletin No. D2, which also describes the Wheelco Capacitrol. Write for your copy, TODAY!

Potentio-trols

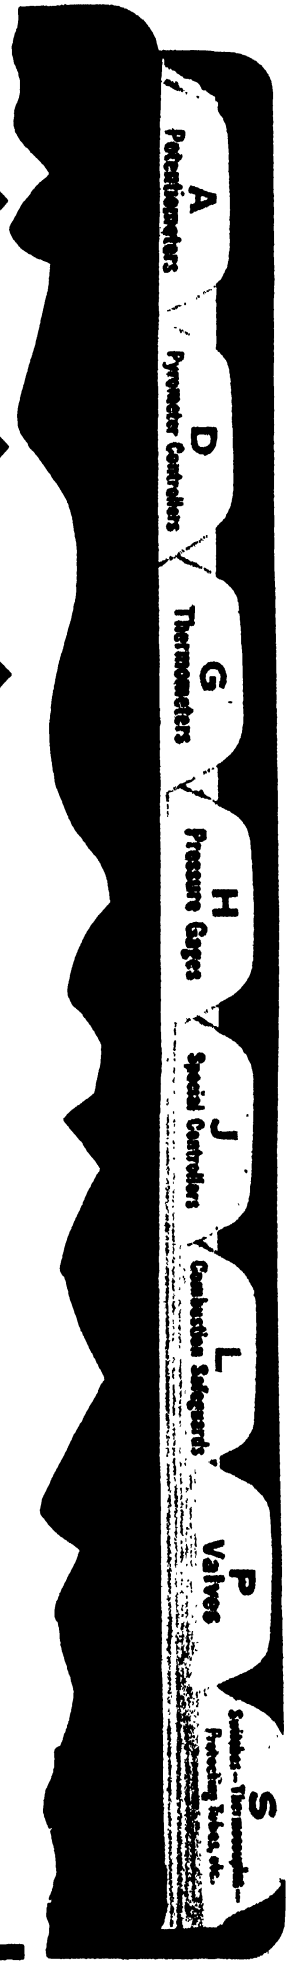
Wheelco POTENTIO-TROL



—is the ultimate in temperature control—combining the unexcelled sensitivity of the "Radio Principle" Control System with the time-proved accuracy of the potentiometric method of temperature measurement. Request Bulletin A2 for complete details.

Capacitrols

Wheelco CAPACITROL



This millivoltmeter type, Indicating Pyrometer, combined with the "Radio Principle" Control System, provides close, instantaneous temperature measurement and control. Capacitrols are fully described in Bulletin D2.

Recording Therm-otrols

Recording THERM-OTROL

—combines an extremely accurate recording thermometer with the "Radio Principle" Control System. This measuring, recording and controlling instrument is available for all ranges between 0 and 1000° F. or equivalent ° C. Write for Bulletin G502-2.

Wheelco Instruments Co.

TECHNICAL ASSOCIATION OF THE PULP AND PAPER INDUSTRY. Hotel Statler, Boston, Mass., September 29 to October 1.

[1] The list of the SOCIETY's National Officers and Directors, Editors, members of Council, Divisional and Local Section Officers, Committees, and Chapters of Student Affiliates appears in CHEMICAL AND ENGINEERING NEWS three times a year—usually February 10, May 10, and October 10. The latest list is printed on page 601 of the May 10 issue.

Procurement Problems Discussed

A DESCRIPTION of the urgency of the U. S. Army in procuring chemicals was summed up in one statement by Major S. N. Cummings, chief of Chemical Procurement, at a recent War Production Conference in Newark, N. J., when he said, "Anything we order, we needed yesterday."

Major Cummings was a speaker in the Panel on Substitute Materials, Chemical Equipment, and Plant Safety, and addressed his remarks mainly to the chemical manufacturers in explaining the workings of the chemical procurement group and the particular problems involved in purchasing and letting contracts for chemicals.

"When the Procurement Office asks for a quotation, please be prepared to give it to us", he said. "We are working under pressure and need all the speed and cooperation that can be given us. Remember also", he continued, "that no man in the chemical procurement is an industrial misfit, but rather the chief of the service has chosen each man for his ability and because he knows his special field thoroughly."

The Chemical Procurement Division has the power to raise or lower prices, Major Cummings said, according to the status of the profit made by the manufacturer from the contract. Contracts are granted commensurate with the financial responsibility of the company.

The Chemical Warfare Service works very closely with the Labor Department. If necessary, a branch office of the Labor Bureau will be set up in the plant of any manufacturer with a view to solving labor problems that may arise. If the company is falling behind in its contracts with the Army, a specialist from the labor board will investigate and install necessary corrective measures to speed up the productive output.

In conclusion Major Cummings said that he did not know "of any industry that has cooperated so unselfishly and so wholeheartedly as the chemical industry, but the new program for the chemical industry will make the efforts of the past seem infinitesimal."

On the same program Captain W. F. Plank, C. W. S., spoke on "Safety Precautions in Handling Pyrotechnics". Captain Plank reviewed briefly the many technical precautions that are taken as a mat-

Coal Research at Battelle

IMPROVED equipment for the utilization of bituminous coal for comfort heating, for metallurgical applications, for the locomotive, and for power generation is foreseen by fuel engineers who addressed 140 representatives of the bituminous coal industry, May 28, at an all-day conference and exhibit on bituminous coal research, sponsored by Bituminous Coal Research, Inc., at the Battelle Memorial Institute, Columbus, Ohio. Smokeless space heaters and service water heaters, completely automatic residential stokers, chemical treatment of coal to render it dustless, an industrial forge furnace which utilizes pulverized coal, and other new developments which will increase the markets for coal were demonstrated and discussed.

Coal is sprayed and tested for dustiness on a laboratory scale at Battelle.

ASPHALT SPECIALTIES IMMEDIATELY AVAILABLE!

With these experimental asphalt blowing stills and muffle furnace, Wishnick-Tumpeer's technicians determine the exact manufacturing conditions needed to produce asphalt for specific purposes.

Asphalt specialties, compounded to meet your requirements, can be delivered to you *promptly* from Wishnick-Tumpeer's two conveniently located plants!

Pioneer Asphalt Compounds are produced from carefully chosen raw materials . . . selectively blended and processed to exact specification . . . subjected to rigid laboratory inspection. These asphalts have been serving the nation's industries for 42 years, in the manufacture of such diversified products as rubber, paint, paper, insulating and waterproofing compounds. Today they are playing an even more vital role in the manufacture of submarine batteries . . . in the construction of underground hangars . . . in paving for airport runways, roads and streets . . . in protective coatings for shipping airplane parts . . . in electrical equipment and rubber products essential to victory. And skilled research technologists in Wishnick-Tumpeer's research laboratories are constantly at work developing new compounds for many other purposes.

If *you* need asphalt specialties—and need them in a hurry—bring your problem to us. We are ready to assist you in selecting or creating specifications for an asphalt that exactly meets your requirements—that can be delivered to you without delay—that will assure uninterrupted production in your plant. A complete line of asphalt paints is also available. Write for information.

ter of course in protecting plants working on explosive mixtures. Police protection is provided by the Army, not the FBI, Captain Plant revealed, this responsibility having only recently been taken over from the federal bureau.

Safety in the plants has several broad outlines. Dispersion of manufacturing operations is one of them. All procedures must be isolated in small compact units, built usually with three sturdy walls of reinforced concrete, and with the remaining wall constructed to fracture easily. Dust must be controlled, as it is one of the means of propagating explosions. All mixing is done by remote control and equipment is sparkproof nonferrous construction. Floors are conductive and nonsparking and are usually made with layers of concrete, mastic, copper plate or sheeting, and finally conductive rubber. They are used frequently where dust hazards are extreme. Static potentials on belts are prevented through use of a colloidal graphite dressing. Captain Plant stated that humidity is also controlled as most explosions occur when the humidity falls below 40 per cent relative. Explosions, it has also been noted, he said, happen most frequently when the barometer is falling.

Other speakers briefly outlined the uses of plastics, glass, hard rubber, and protective coatings in the war effort. They were Robert J. Moore, Carbide & Carbon Chemical Co.; J. T. Thompson, Corning Glass Works; Donald Wilkins, American Hard Rubber Co.; Francis Scofield, National Paint and Lacquer Association.

CONSTRUCTION of a Swedish factory to extract turpentine oil and by-products from tree stumps, under government control, is reported from that country.

Army Begins Chemical Plant Visitations

General Paul X. English, chief of Industrial Service of the Chemical Warfare Service, and Colonel Harry A. Kuhn, chief of the New York Procurement District, attending the Army Visitation Exercises at Hooker Electrochemical Co., Niagara Falls, N. Y.

THE first of a series of Army visitations to war production plants in Niagara Falls was held at the main plant of the Hooker Electrochemical Co. on May 26. A large group of enlisted men, soon to move on to one of our fighting fronts, spent two hours going through the various departments and talking with the chemical plant operators individually. Out of these informal discussions, both soldiers and operators gained a clearer understanding of the others' part in the war effort.

General Paul X. English, chief of Industrial Service of the Chemical Warfare Service, headed the staff of officers which included Colonel Harry A. Kuhn, chief of the New York C. W. S. District; Colonel Floyd D. Carlock, commanding officer of Fort Niagara; Lieutenant-Colonel Frank R. Johnson, head of the Niagara Falls Chemical Warfare Division; and Lieutenant-Colonel Leslie Sutherland and Major Cummings, both of the New York Chemical Warfare District Office. General English was accompanied by Major William Brooks from Washington, and Captain Cleveland J. Bishop, also of Washington, represented General Sommervell of the Service of Supply.

Harry M. Hooker, president of the company, and Edwin R. Bartlett, executive vice president, joined the Plant Service Committee as hosts to the Army visitors. Refreshments were furnished in the plant restaurant.

When the tour of the Hooker plant had been completed, the soldiers, officers, and workmen moved out into the plaza in front of the Administration Building to hear a talk by General English, who developed the theme that "the work of you chemical plant operators is just as

STEAM JET EVACTORS
AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

Do you use ammonium salts?

maybe you should consider

ammonium thiocyanate

(Ammonium Sulfocyanide)

Here is a newly-available ammonium salt with interesting possibilities introduced by the thiocyanate group.

If you are now using an ammonium salt in your processes . . . such as chloride, acetate, oxalate, carbonate or nitrate . . . perhaps you will discover valuable modifications by substituting ammonium thiocyanate.

It is worth testing in your laboratory.

Ammonium thiocyanate has a behavior similar to other ammonium salts, but it also brings you all the variations of the thiocyanate group.

This group is remarkably stable and, in many reactions, resembles the halogens.

Koppers has recently placed in operation a large commercial plant for the production of ammonium thiocyanate crystals and can now offer this chemical in quantity at substantial savings over former costs. Koppers can supply ammonium thiocyanate in crystal form having a minimum purity of 95%.

Test samples, quotations and other information sent on request.

Army Begins Chemical Plant Visitations

CONTINUED FROM PAGE 812

necessary as the work of the man behind the gun".

His address in condensed form follows:

I speak to you today as a soldier. Every man, woman, and child in the United States wants to know what he can do to help win the war. Those able to bear arms who are not in the Army often have the uncomfortable feeling that they are not serving as fully as they should. Those who cannot bear arms, often feel that their efforts are weak and ineffectual, compared to the total problem. I will tell you how the Army feels about these matters.

This is a new kind of war. It is a war of both machines and men. The armies over which the Nazis rolled were not composed of weaklings or cowards. The Dutch, Jugo-Slavs, French, Belgians, Poles, Greeks, and all the other brave peoples who are enslaved by the Nazi terror wished to defend their homelands, but with what? No amount of bravery, love of country, willingness to do or die could long stand up against armored force, without armored force with which to counter. That is why we in the Army consider the workers as soldiers of production in this war.

Your work is as necessary as the work of the man with the gun. Without it, there can be no gun—and then—no man. The soldier faces hopeless odds, unless you keep him supplied. War has become so mechanized that against the 8 or 10 workmen it took to enable a soldier to pull the trigger in the first World War, it now takes 20 or more workmen.

This is not only a war of machines, it is also a war of chemicals. The steel and metal which the machine makes need to be filled with chemicals. Chemicals must treat a host of materials to protect them against war damage. Chemicals are vital in the course of almost every industrial process to make munitions. Incendiary bombs are filled with chemical materials. These are being used on every hand.

General Doolittle told the Chemical Warfare Service, and the fact was published by the War Department, that he was highly impressed by the workmanship and action of the incendiary bombs he and his heroic fellow soldiers dropped on Tokyo. Inflammable Tokyo was your target as well as General Doolittle's and his men. It was your military objective, as much as the Army's.

The Japs are reported to have used war gas in China. Such gases are chemicals, and chemicals are vitally needed as well for protection against war gases. Prime Minister Churchill warns that Germany may use gas. We must be prepared for all these contingencies. The people know that the best defense against war gas is retaliation.

Chemicals are not alone important to our fighting men, they are just as essential for the protection of our loved ones at home. Chemicals are materials of war, just as vital as guns and tanks and planes.

In this war our preparations and our actions must be complete. There can be no flaws in our armor; no hole through which the enemy can drive a wedge. One such hole, no matter how small, may well prove fatal. We are engaged in a titanic struggle with powerful enemies, but no enemy is greater than ourselves. Complacency and overconfidence can defeat us as they defeated France. Selfish internal bickering and discontent are as effective as bombs and bullets. The factory where time is lost is a factory half bombed. Every minute of idleness or of an idle machine adds to the length of the war.

Americans are used to playing as a team. You and the Army and Navy are a team. You are the passers, we the receivers. You give us the ball, and we will carry it. It takes a very poor judge of the game not to recognize the equal importance of the passers and the receivers. Americans are too adept at games not to see that clearly.

No matter how tough the task is, how uninteresting it may seem, and how many hours you have to put into it, just bear in mind that somewhere, someone in uniform is waiting for what you turn out. If it doesn't arrive on schedule, it may mean the difference between life and death to him. And that person may be a father, or a brother, or a young fellow from this very plant.

You are fortunate in being able to do your particular job in surroundings such as these. You don't have to dodge bombs and bullets in stinking swamps, or on blazing desert sands. You have regular hours. You can wash up and go home at night to loved ones, and enjoy the comforts of your own home. The soldier can't. He doesn't punch a time clock, and his wartime pay check is much smaller than yours. He is fighting for his country under many more disadvantages than you have. He is bearing a very heavy pack, but he does not envy you your modest comforts; he wants you to enjoy them if you will but roll the material out to him in the field.

The godless and inflated egotist Hitler has boasted that a free people can't produce. He has challenged the democracy of free men with a drab collectivism of slogan-chanting robots, but Americans are from Missouri, and he will have to show us! Each of us—workers and soldiers alike—will see to that. Your work clothes are your uniform, as dignified and as important as that of a combat soldier. We, the soldiers, tell you that.

The Army recognizes the importance of your work. The War Department is arranging to award suitable recognition to workers and to plants that distinguish themselves in production. Plants will receive the Army Pennant which will bear an "A" similar in purpose to the "E" flags now awarded by the Navy. Workers will receive a companion button which will honor the individual worker who has earned it by merit.

Every minute of your working day remember the men who are waiting for what you make—in the desert under the blazing sun, in the northland in ice and snow, on the sea, in the forest, on the field and cramped in forts—and grimly and realistically under fire.

As General Sommervell has pointed out, these men are too busy protecting this job of yours to think of the quitting whistle or profits, or wages, or overtime, or vacations. Take as yours the motto of the Chemical Warfare Service:

"The difficult we do promptly; the impossible takes a little longer."

There is no time for bombast and blueprints. These are the tools of too little and too late.

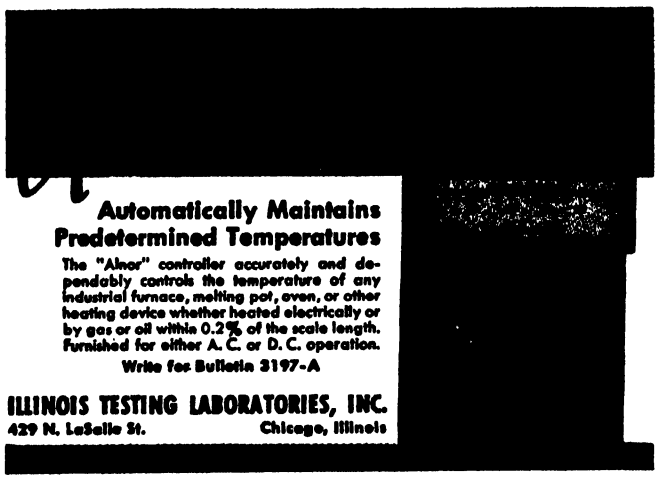
General Porter, chief of the Chemical Warfare Service, has said: "This is a war of production. Whichever side produces the most will eventually win." There is time only for toil. This means sweat and sacrifice on your part today, to prevent unnecessary bloodshed and death on the soldier's part tomorrow. It means unstinting contribution by both labor and management to a degree never before attained, but which must be reached if we are going to win.

You will, I know, cheerfully deny yourselves many a peacetime privilege in order that the men at the front may carry on, and in addition to this, you will work like demons to see that they have the materials with which to win. Our country is like that. Every crisis makes it more determined to gain the victory, and this time it will be satisfied with no patchwork victory—only with a conclusive one—for this

CONCLUDED ON PAGE 816

"WHICH WAY FROM HERE, BROTHER?"

The short and easy way, Mr. Fish . . . the Sharples way. Your trip to the consumer has been a vastly different one since the adoption of the Sharples Process for Fish Oil Recovery.



A many-hour gravity settling job with its accompanying degradation of oil quality is now done in five to ten minutes with the Sharples Super-Centrifuge or Nozljector . . . the original light-color and low acidity of oil retained.

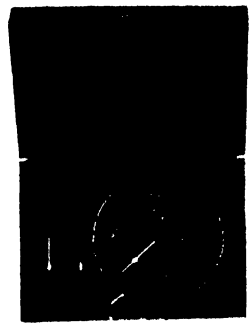
The loss of oil as based on water discharge is cut from up to 5% to about 0.25%.

The condition of the fish or its diet in the past are no longer serious considerations.

These are a few facts . . . there are many more . . . and all of them illustrate a typical example of Sharples progress in increasing the efficiency of industrial processes throughout the world.

THE SHARPLES CORPORATION

Automatically Maintains Predetermined Temperatures



The "Almor" controller accurately and dependably controls the temperature of any industrial furnace, melting pot, oven, or other heating device whether heated electrically or by gas or oil within 0.2% of the scale length. Furnished for either A. C. or D. C. operation.

is no war among nations, it is a world showdown between free men and slaves.

"We shall keep the soldier's faith", promised General MacArthur.

Here and now we dedicate ourselves again that we *will*, you the workers, and we the soldiers.

As part of the general exercises, the entire assemblage sang the following new industrial version of "Over There". Its suitability for general use in similar exercises justifies its reproduction here:

Over Here and Over There

Over there! Over there!
On the land—on the sea—in the air!
While the Navy's gunning—the Army's coming,
Our Leathernecks are everywhere.

Over here! Over here!
We will fight for the right—never fear!
Guns are booming—our plants are zooming,
We will help them win by working over here!

Over here! Over there!
Let's unite—let's be right—don't despair—
While our boys are winging—let's keep them singing,
Let's stand behind them everywhere—

Bob is here! Bill is there!
Hookerites—scaling heights—over there!
We are with them—let's help to give them
All the things they'll need till it's over—over there!

R. Lindley Murray, vice president in charge of development of the Hooker Co., presided at a dinner given to the visiting officers at the Niagara Falls Country Club with the executives of all the principal chemical plants of Niagara Falls. General English and other officers were introduced and spoke briefly.

Power and Mechanical Engineering Exposition

THE Advisory Committee for the 15th National Exposition of Power and Mechanical Engineering, to be held in New York November 30 to December 5, 1942, again has Irving E. Moultrop as chairman with John H. Lawrence vice chairman. Other members include Comfort A. Adams, E. G. Budd Mfg. Co.; Homer Addams, past president, American Society of Heating and Ventilating Engineers; J. T. Barron, Public Service Electric & Gas Co.; R. E. Dillon, Boston Edison Co.; E. O. Eastwood, president, American Society of Heating and Ventilating Engineers; A. C. Fieldner, U. S. Bureau of Mines; N. E. Funk, Philadelphia Electric Co.; Wm. R. Hainsworth, president, American Society of Refrigerating Engineers; David Moffatt Myers, consulting engineer; Joseph Pope, Stone & Webster Engineering Corp.; Arthur L. Rice, *Power Plant Engineering;* Charles F. Roth, manager, exposition; A. Bowman Snavely, Hershey Chocolate Corp.; E. K. Stevens, associate manager, exposition; Philip W. Swain, *Power;* Alfred Vaksdal, Corning Glass Works; and Horace W. Wilds, past national president, National Association of Power Engineers.

One hundred and twenty-five companies have engaged space, and exhibitors are planning displays that will help the war production program by showing how to get more out of existing equipment and ways and means of preventing shutdowns and ensuring continuous operation.

As in the case of previous Power Shows, the forthcoming event is under the management of International Exposition Co. Permanent headquarters are at Grand Central Palace, New York.

3 CHLORINATED ORGANIC CHEMICALS *developed by* PENN SALT RESEARCH

Hand in hand with manufacturing, Penn Salt carries on unremitting research... seeking new compounds, improvements in present products and better production methods.

Now from our Research Laboratories come three chlorinated organic chemicals with interesting properties and possibilities. One or more of them may aid you in replacing restricted essential materials, help you in developing new products, or suggest important changes in your present processes.

2, 2, 3, TRICHLOROBUTYRIC ACID*

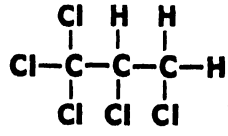
$CH_3 \cdot CHCl \cdot CCl_2 \cdot COOH$

PHYSICAL PROPERTIES:

Appearance—white crystalline solid.
Molecular Weight—191.5.
Melting Point—60° C.
Boiling Point—236° C. with only slight decomposition at the boiling point.
Hygroscopic.
A slightly stronger acid than trichloroacetic acid.
Mild odor.
Soluble in water.
Soluble in organic solvents.

*Available as a white crystalline solid, in 60% aqueous solution, or in other strengths.

SUGGESTED USES:



Its similarity to trichloroacetic acid suggests its application where a rather strong organic acid is needed. It appears to have possibilities as a tanning assistant. As an intermediate, it enters into the usual acid reactions forming salts and esters, and in addition it contains reactive halogens greatly increasing its value for the synthesis of further useful compounds.

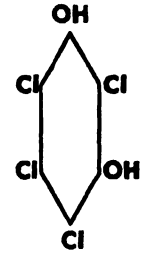
A full series of aliphatic and other esters have been prepared in our Research Laboratories and are available in research quantities.

Many of these esters are characterized by a fine odor which suggests the possible use of the lower members of the series in soaps, perfumes, and other articles in which fragrance is desirable. The higher aliphatic and polyhydric alcohol esters such as the glycol esters, on the other hand, being practically without odor, but of high viscosity, are potential plasticizers. Formulators will be interested in the penetrant and solvent properties of many of these new materials. Leather, textiles, and paper are a few of the fields suggested for possible use.

1, 1, 1, 2, 3, PENTACHLOROPROPANE

$CCl_3 \cdot CHCl \cdot CH_2Cl$

PHYSICAL PROPERTIES:

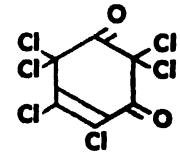


White crystalline solid.
Melting not lower than 178° C. for pure grade, 140° C. for technical grade.
Sublimes.
Has odor of camphor.
Soluble in organic solvents.
Insoluble in water.

SUGGESTED USES:

Its odor suggests its use as an insect repellent. Its compatibility with nitrocellulose and other plastics indicates possible plasticizer value. As an intermediate, it can be dehalogenated, dehydrohalogenated, and enter into other organic halide reactions, producing additional interesting compounds.

TETRACHLORORESORCINOL



$C_6Cl_4(OH)_2$

PHYSICAL PROPERTIES:

White crystalline solid.
Melting point—141° C.
Faint pleasantly phenolic odor.
Soluble in organic liquids, hot water or dilute alkali—sparingly soluble in cold water.

CHEMICALLY, it is a mild reducing agent, and with chlorine yields* hexachlorocyclohexene-1-dione, 3-5, a quinone of interesting possibilities:

*Beilstein, Vol. VI page 820

SUGGESTED USES:

Condensation of this resorcinol for the preparation of eosin-type derivatives should lead to a series of compounds of possible dyestuff interest. Its antiseptic use is indicated as of probable practical value. In these days of need for phenolics, this compound will probably receive careful evaluation as to uses.

We shall be glad to send samples for investigation and to cooperate with you in working out applications. Probable prices of commercial quantities, when available, supplied on request. Write Dept. CEN.

Specify Florite Desiccant

For Efficient Dehydration of GASES and LIQUIDS

FLORITE, the new granular drying agent, is now being used successfully for dehydrating natural gas, propane, gasoline, air, nitrogen, carbon dioxide and other gases and liquids where high drying efficiency is required.
It selectively adsorbs 4 to 20% of its weight in water, depending upon the particular application, and is regenerated by heating to 300–350°F. FLORITE is hard, stable, non-corrosive, non-poisonous, and is available in a variety of particle size classifications.

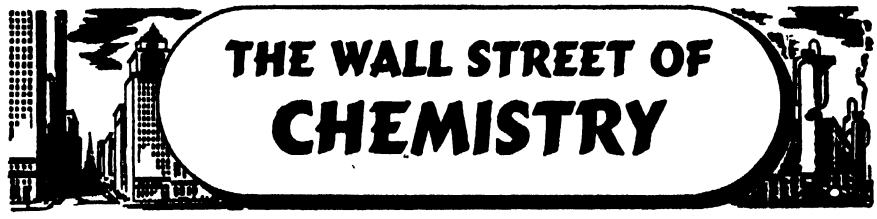
The L. S. O. G. Exchange

Edited by A. A. Ashdown, Ed. F. Degering, J. E. Hawkins, and S. L. Redman

Send Items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

ACTIVITY in the North Carolina Section enters in the considerable number of universities and colleges within approximately 20 miles of Durham. Although this area embraces the highest concentration of chemists in North Carolina, it actually includes only about half the total membership of the section. The others are scattered from Henderson to Wilmington, roughly 300 miles, singly and in small groups. The section is thus acutely involved in the problem of a scattered membership, many of whom are unable to attend any of the meetings.



The senior members who are within range of the section's activities are preponderantly teachers who feel that one of the section's most important functions is to present distinguished chemists to several hundred students of chemistry and chemical engineering and thus promote a professional interest in chemistry and the activities of the AMERICAN CHEMICAL SOCIETY.

The affairs of the section are in charge of an executive committee of eight. Included are the chairman, vice chairman, secretary, three immediately past chairmen, and the two councilors. A committee member is usually incumbent for several years and continuity of purpose in section affairs is thus assured.

The North Carolina Section has no local dues and is consequently entirely dependent on the national apportionment for the maintenance of its program. These funds are occasionally augmented by those contributed by other scientific societies for joint meetings. Some of the meetings are also partly underwritten by one of the universities. The budget usually permits six or seven speakers per year, in addition to a joint meeting with the North Carolina Academy of Science at which the members of the section present papers on research subjects. This section has not often called on its own members for lectures.

A highly successful membership drive, under the direction of a capable committee, increased the section's membership from 133 as of December 1940 to its present 162. The committee found a general publicity campaign highly effective. The increase is mostly in junior membership. The section has made the students within range aware of the activity and purpose of the SOCIETY.

Attendance at meetings has suffered somewhat this season in consequence of the national emergency. A considerable number of North Carolina chemists are actively engaged in research on military projects and in teaching courses under the E.S.M.D.T. All in all, the North Carolina Section seems to be performing its functions in a satisfactory manner. It is a going concern and growing.—SHERMAN E. SMITH, *Secretary, North Carolina Section.*

Commercial Alcohols, Ltd., for the fiscal year ended March 31, 1942, reports net profit of $90,111 after depreciation, interest, taxes, etc., equal after preferred dividends to 35 cents a share on common. This compares with $73,515 or 28 cents a share in the preceding year.

For nine months ended March 31, 1942, **E. R. Squibb & Sons** and subsidiaries report net profit of $1,801,516 after federal income taxes and extraordinary reserves of $207,457, equal after dividend requirements on $5.00 preferred stock to $3.71 a share on common. This compares with net profit of $1,347,353 or $2.40 a share on common for the nine months ended March 31, 1941.

For nine months ended March 31, 1942, the **Vick Chemical Co.** and subsidiaries report net profit of $2,458,752 after depreciation, provision for federal and foreign income and excess profits taxes, etc. This is equal to $3.61 a share on common and compares with $2,576,887 or $3.78 a share in the nine months ended March 31, 1941.

The **West Virginia Pulp & Paper Co.** and subsidiaries, reporting for six months ended April 30, 1942, show net profit of $2,513,629 after depreciation, depletion, interest, amortization, and provision for federal and excess profits taxes. This is equal, after dividend requirements on 6 per cent preferred, to $2.27 a share on common, and compares with $2,206,428 or $1.92 a share for the six months ended April 30, 1941.

The **York Ice Machinery Corp.** reports that earnings for the six months ended March 31, 1942, are estimated to be $784,000 (before income and excess profits taxes, surplus charges, and other reserves customarily established at the year end), compared to a $70,000 loss in the same period of the preceding year. Uncompleted orders not reflected in earnings at March 31, 1942, amounted to $14,659,256, or an increase of 104.4 per cent over the same date a year earlier. In view of rising costs and price ceilings it is not likely that the same degree of earnings improvement can be expected to continue. The U. S. District Court has decided the suit to enjoin its plan of merger and recapitalisation in its favor in all respects.

Small Pumps for Pilot Plant, Experimental or General Laboratory Use

Eastern Husky Midget Pumps speed up operations, meeting almost any problem of laboratory pumping. Their light weight permits quick, easy moving from one job to the next. They are made in several alloys for all liquids, corrosive or non-corrosive.

It may take anywhere from five to fifteen years for a new chemical to advance from test tube to tank car—from the laboratory into volume production for commercial use.

Post-war conditions are likely to call for widespread utilization of chemical products that now are still in the test tube stage. Because of this, research at

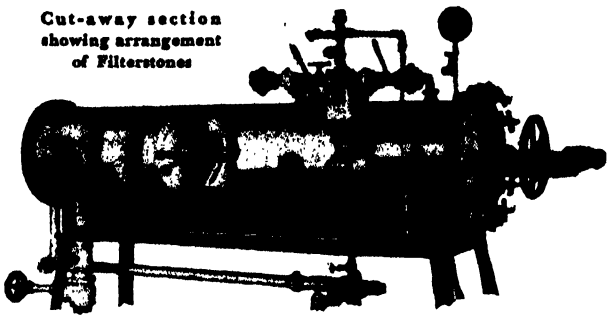
New Rubber Reclaiming Process Developed



A method of reclaiming used rubber which is said to increase the capacity of certain existing equipment by 60 per cent has been developed by the United States Rubber Co., Rockefeller Center, New York, N. Y. The processing cycle is reduced from 16 to 9.5 hours, and the quality of the finished reclaim is improved because of a change and a reduction in the chemicals used in the process, according to W. G. Kirby, manager of reclaim development of Naugatuck Chemical Division, which operates the reclaim plant for the company.

If present plans for scrap rubber collection are successful and used rubber is made available in large quantities, Mr. Kirby said, this process along with other developments of this kind may be valuable for increasing present reclaim capacities without construction of additional plant facilities.

In reclaiming used rubber, he pointed out, it is necessary to remove or dissolve any fabrics which the used rubber may contain. The scrap is also treated to soften or plasticize the rubber and convert it to a physical state similar to unvulcanized rubber. According to former processes, a digester was charged with scrap rubber, caustic soda, pine tar oils, and water, Mr. Kirby explained, and the mass was heated by steam under pressure and agitated for 16 or more hours. With the new method, air is introduced into the chamber with the scrap, the steam pressure is increased to raise the temperature, the amount of pine tar oils is reduced, and the mixture is agitated for a much shorter time.

One of the most important nitrate plants of Chile has been reopened. This plant, Rica Aventura, was scheduled to resume operations in March, after 12 years of inactivity, and will employ about 1,000 workers.

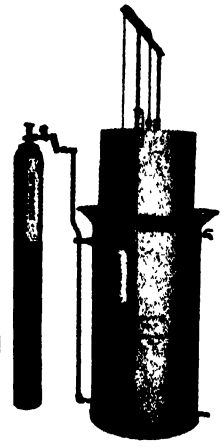
THE OHIO GASOMETER



For Industrial...Educational... Commercial...Laboratory Work

THE plus value of the Ohio Gasometer makes gas storage in the laboratory no longer a problem.

In addition to all the worth-while features of previous types of storage equipment, the Ohio Gasometer presents a "plus value" because of these and other definite, tangible improvements:

★ Gas Leakage minimized
★ Loss of sealing fluid due to splashing over, prevented
★ Sealing fluid cannot get into line

THE MODERN WAY

The CAULFIELD PIPETTOR has overcome the old way of pipetting with the mouth. It brings a clean, sanitary and safe technique. No more serious accidents — no contamination. The PIPETTOR is light and convenient to hold. It provides hair-line accuracy. The entire length of pipette is visible when drawing up and measuring off. The PIPETTOR is made to be used with any size pipette.

ACCURATE!
SANITARY!
SAFE!

The CAULFIELD PIPETTOR consists of a rubber bulb over a cleverly devised valve, with an extremely sensitive valve control at the top. It will draw up any desired quantity of fluid and accurately discharge to less than $1^{1}/_{100}$ of a c.c.

Laboratory Supplies and Chemicals

161 Sixth Avenue — New York, N. Y.

Chemical Engineering Plant Design. *Frank C. Vilbrandt.* 2nd ed. 452 pages. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1942. Price, $5.00.

THE new edition of this book represents a physical expansion of about one third, compared with the original edition which appeared in 1934. Pages have increased from 327 to 452, tables from 103 to 133, and illustrations from 53 to 67. The descriptive text of the earlier edition has not been greatly changed, although numerous significant additions of timely material have been made.

A notable improvement is a rearrangement of chapters, which enables a more logical development of the subject in the following order: Introduction, Foundations, Drainage, Piping Installation, Pumps and Pumping, The Building, Power and Power Transmission, Development of the Design Project, Flow Diagrams, Selection of Process Equipment, Plant Layout and Elevation, Preconstruction Cost Accounting, and Locating the Chemical Plant.

The increased number of tables and figures, which accounts for most of the expansion in the new edition adds greatly to the genuine utility of the book as a source of information. Outstanding additions are tables on Fire Hazard Properties of Certain Flammable Liquids, Gases, and Solids, Recommendations for Nonmetallic Materials of Construction, Chemical Raw Material Sources, and expansion of the section giving typical cost data. The scope of the author's treatment is further widened by a much greater use of literature citations, particularly to recent pertinent material and to lengthy lists of suggested collateral reading following many chapters.

The design of plants in the processing industries involves so many related problems that years of experience would be required to develop first-hand knowledge of many of the factors which must be considered in order to arrive at a satisfactory conclusion. This book can provide the practicing engineer with a wealth of essential information regarding details of both design and cost estimation. At the same time its logical treatment can guide the development of the design project from the initial laboratory stage to the proposal and plans for a large commercial plant. It will be of particular value to the young engineer who, lacking experience, must supplement his theoretical training with an appreciation of the practical details that determine the success or failure of an actual project.

Since its introduction this has been a popular text for a design course often given to senior chemical engineering students. The new arrangement and greater factual content make it even more desirable for such use.

HOWARD S. GARDNER

Liebig and after Liebig. A Century of Progress in Agricultural Chemistry. Publication No. 16 of the American Association for the Advancement of Science. Edited by *Forest R. Moulton.* xii + 111 pages, 19 × 26 cm., 11 figures, 8 portraits. The American Association for the Advancement of Science, Washington, D. C., 1942. Price, $2.00.

THIS volume contains the papers presented before the Sections of Chemistry and Agriculture of the American Association for the Advancement of Science in a Symposium at the Philadelphia meeting December 1940. One hundred years earlier Justus von Liebig's "Organic Chemistry in Its Application to Agriculture and Physiology" had been published and, since it had such a profound effect in directing scientific thought toward agricultural problems, the centenary of its appearance was made the occasion of this symposium.

Following an introductory chapter by Charles A. Browne on Justus von Liebig—Man and Teacher, the volume is divided into two sections. Section I, "Organic Chemistry, Enzymes and Nutrition", contains papers by H. R. Kraybill, "Liebig's Influence in the Promotion of Agricultural Chemical Research"; H. B. Vickery, "Liebig and the Chemistry of Proteins"; A. K. Balls, "Liebig and the

SARGENT
SCIENTIFIC
LABORATORY SUPPLIES

Beyond the Flyleaf

CONTINUED FROM PAGE 822

Chemistry of Enzymes and Fermentation"; and Paul E. Howe "Liebig and the Chemistry of Animal Nutrition". Section II, "Soils, Fertilizers, and the Mineral Requirements of Plants" contains papers by R. Bradfield, "Liebig and the Chemistry of the Soil"; S. A. Waksman, "Liebig—The Humus Theory and the Role of Humus in Plant Nutrition"; H. A. Curtis, "Liebig and the Chemistry of Mineral Fertilizers"; C. A. Browne, "Liebig and the Law of the Minimum"; and B. E. Livingston, "Liebig and the Mineral Requirements of Plants as Indicated by Means of Solution Cultures".

The authors of the various chapters alone would attest to the excellence and thoroughness with which the topics are discussed. Each and every one of the authors has given evidence in his chapter of a profound study of Liebig's views and scientific contributions, and has shown how these have influenced later workers. The story each tells is fascinating, and most of the chapters sweep the reader along the stream of scientific achievement with an almost endless view of scientific landmarks.

A hundred years later is perhaps the best advantage point from which to view the accomplishments of any individual. That which remains has been stripped from the dross and appears as true gold. Liebig left much gold behind and it is brought out in this volume in all of its brilliance. Too often we forget to look behind our present knowledge for the sources from which our science arose. Every student of chemistry, and especially those interested in agricultural chemistry or in biochemistry, should read this volume. They not only would acquire a historical perspective of how their science came to be but they should get some appreciation of the thrill which is associated with a new discovery or the formulation of a new scientific theory—a discovery or a theory which may profoundly affect the thinking of future generations.

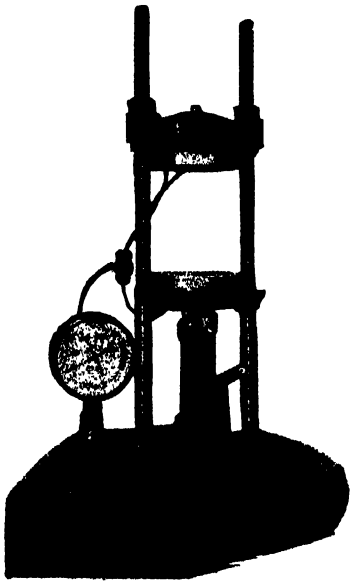
To review adequately any chapter would be to quote it in its entirety. Essentially each paragraph is pertinent. This volume should become a classic in the field of chemical history. It will bear reading and re-reading as the years go by.

Ross Aiken Gortner

Equilibrium and Kinetics of Gas Reactions. An Introduction to the Quantum-Statistical Treatment of Chemical Processes. *Robert N. Pease.* 1st ed. 236 pages. Princeton University Press, Princeton, N. J., 1942. Price, $3.75.

This is a textbook designed for students well grounded in the principles of chemistry and mathematics. It is written in a refreshing style, the author always letting the reader in on what he is going to discuss next. It abounds in practical illustrations, so that a chemist or chemical engineer who has not been in a classroom for years will find much of profitable interest.

Part I consists of three chapters devoted to chemical equilibrium. The first and second chapters contain an excellent review of the contributions of thermodynamics to this subject. In Chapter III is given a survey of the quantum-statistical method of calculating free energies and equilibrium constants. A number of examples shows that equilibrium constants may be calculated from data entirely independent of chemical measurements of equilibria.



The second and largest part of the book deals with the kinetics of gas reactions. It begins with a brief résumé of a rate equation based on a statistical treatment and on the assumption of the existence of an activated complex in equilibrium with the reactant molecules. Then follow several chapters in which various types of reaction are taken up and discussed in the light of this theory.

The book is sufficiently different from others pertaining to the subject to warrant careful study by all chemists interested in the field. It should prove to be very useful as a text and reference in courses of about the first-year graduate level.

FRED S. CARVER
HYDRAULIC EQUIPMENT
347A HUDSON ST., NEW YORK

The Electron Microscope. *E. F. Burton* and *W. H. Kohl.* 233 pages. Reinhold Publishing Corp., 330 West 42nd St., New York, N. Y., 1942. Price, $3.85.

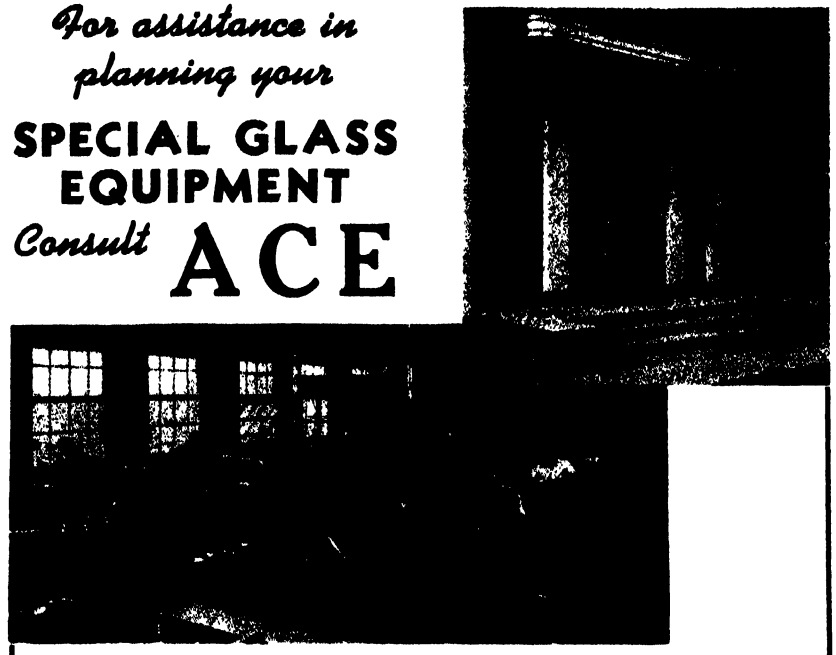
THE reviewer has often been asked to act as critic at amateur theatrical performances because he "represented the audience's viewpoint", as one director put it. It was in this spirit that he agreed to review this book, fearing that courses in quantum mechanics and matrix algebra would be necessary as rudimentary background.

In this respect the book proves to be a pleasant surprise. It is technical and discusses in detail the theory necessary and sufficient for an intelligent understanding of the electron microscope; but it builds up the background so carefully and from such elementary beginnings that the reader can follow quite easily the later chapters dealing explicitly with this extraordinary instrument, especially where the concept of electron lenses is treated. In fact, the introductory chapters provide about the best presentation that the reviewer has seen of the rival wave and corpuscular theories of radiation, reconciled (on paper at least) by the wave concept of electrons. The authors also do an excellent job in explaining the resolving power of optical systems.

The book is hardly to be recommended to the specialist or to one technically trained in the theory and practice of electron lens systems. To the average chemist, however, who wishes to learn in general how the instrument works, what its limitations are, and how its results may be interpreted, the book should prove a valuable addition to his library.

The price seems rather high, but this is doubtless accounted for by the large number of drawings and cuts. For the average chemist and physicist about 25 per cent of the drawings are probably superfluous as being too elementary; the halftones, however, are well chosen and striking and as well reproduced as could be expected on the paper used. The latter is naturally a compromise between poor reproduction on one hand and extremely expensive paper on the other. On the whole, this compromise works out satisfactorily for the authors' purpose and the publishers are to be congratulated on the results.

FRANCIS W. POWER, S. J.



The Spectrum of Hydrogen. *William Mayo Venable,* author and publisher, Blaw-Knox Co., Pittsburgh, Penna., 1942. 184 pages. Price, $2.00.

THIS book summarizes a considerable amount of painstaking effort, on the part of the author, to classify all the lines of hydrogen in one scheme. The treatment is, however, at variance with that accepted

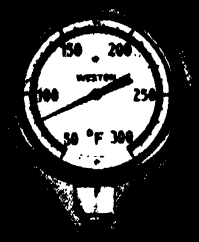
ALFRED LEE SKLAR

Metallurgical and Industrial Radiology. *Kenneth S. Low.* 88 pages. Sir Isaac Pitman & Sons, Ltd., London, 1940. Price, $2.50.

THIS small book has for its principal object "consideration of metallurgical examinations from a practical rather than an academic or research aspect". It contains a good discussion of apparatus and equipment, radiographic technique, and interpretation of radiographs. There are about 25 radiographs of various defective aluminum, magnesium, and iron-base castings.



Chapters on industrial fluoroscopy, radiological examination of welds, and x-ray stereoscopy are included. The book should be of interest chiefly to technicians or executives interested in the preparation or interpretation of radiological reports.

A. C. S. Members Prominent in Borden Awards

MEMBERS of the AMERICAN CHEMICAL SOCIETY have figured prominently in the awards made by the Borden Co. through scientific organizations, described in a 12-page mimeographed "Report on the Borden Awards" that has recently been made available.

AMERICAN CHEMICAL SOCIETY Award, in recognition of outstanding research in the chemistry of milk: 1939, Leroy S. Palmer, University of Minnesota; 1941, Claude S. Hudson, U. S. Public Health Service; 1942, George E. Holm, U. S. Department of Agriculture.

American Dairy Science Association, or meritorious scientific contributions or discoveries pertaining to dairy production or dairy manufacturing, or invention of a plan, process, or device useful, valuable, or significant in the theory and practice of dairy production of dairy manufacturing: Dairy Manufacturing Research Award, 1938, Kenneth G. Weckel, University of Wisconsin, for research in the field of milk irradiation, which resulted in the development of apparatus making the irradiation of milk commercially possible; 1941, Paul F. Sharp, Cornell University, for research on the lipolytic activity of milk in relation to flavor, vitamin C, oxidized flavor in milk, physical state of milk fat, and deaeration of milk. Dairy Production Research Award, 1941, Edwin Bret Hart, University of Wisconsin, for research on the determination of phosphorus in feeds, the effect of phosphorus in animal nutrition, the ripening of cheese, the use of iodine in the prevention of goiter, the grass-juice factor, etc.

American Home Economics Association, for papers dealing with the feeding of dairy products to human subjects, or to research on laboratory animals that has a direct bearing on problems of human nutrition: 1939, Icie Macy Hoobler, Children's Fund of Michigan, for studies over a period of years of the diets of average-health children, in which the effect of milk, the metabolic variations attributable to various kinds of milk, and their effect upon gastrointestinal motility, received study; 1940, Henry C. Sherman, Columbia University, for extensive studies on all phases of the nutritive qualities of milk and its place in the diet; 1941, Julia Outhouse, University of Illinois, for studies and investigations dealing with the role of milk in the diet, demonstrating that the human system utilizes the calcium found in milk more fully than the calcium found in other foods.

Poultry Science Association, for distinctive contributions to poultry science advancement: 1938, Leo C. Norris, Cornell University, for research on the importance of vitamin G in hatchability and chick growth, necessary levels of manganese in poultry rations, and cause, prevention, and cure of perosis among poultry; 1941,

Roland M. Bethke, Ohio Agricultural Experiment Station, for research on poultry nutrition generally, primarily with protein quality, minerals, and vitamins.

Endeavour

VOLUME 1, Nos. 1 and 2, of *Endeavour*, a quarterly review designed to record the progress of the sciences in the service of mankind and published by the Imperial Chemical Industries, London, S. W. 1, England, has just reached this office. Its name is taken from the vessel commanded by Captain Cook, sent out by the British Admiralty nearly two centuries ago for the purpose of carrying out exploration and research in the interests of science. The present purpose is briefly stated—"to enable men of science, and particularly British men of science, to speak to the world in an hour when not only nations but the internationalism of the sciences are threatened by a recrudescence of barbarism in its grossest and most destructive manifestation".

The publication is very attractively put together, with excellent illustrations. In addition to book reviews, articles of particular interest to chemists include "Science in the U. S. S. R.", "Manufacture and Use of Vitamins", "Prospects for Soil Conservation", "Significance of Metal Single Crystals", "Textile Fibres under the X-Rays", "Action of X-Rays on Living Cells", "Phthalocyanines", and "Vegetable Drugs of Britain". The price is five shillings.

Mathieson Issues Anniversary Booklet

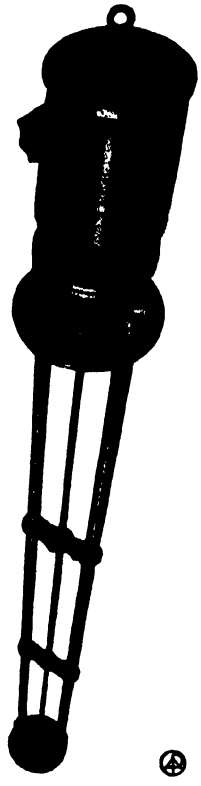
THE founding in 1892 of the Mathieson Alkali Works, 60 East 42nd St., New York, is commemorated in the recently published 46-page booklet "Fifty Years of Chemical Progress". Although 50 years is a relatively brief time in the history of the American chemical industry as a whole, Mathieson ranks as a pioneer in its field—first the manufacture of alkali and bleach and later of liquid chlorine, ammonia, and numerous related products. The development and expansion of the company in this span of years is described in this illustrated and attractively compiled publication. To friends of Mathieson, the company has also sent bronze anniversary medallions.

Synthetic Resins

THE Bakelite Review for April 1942 includes articles on resin-bonded plywood, synthetic resins for coatings, plastics in surgery, designing molded plastic parts, flexible molding plastics, synthetic resin-base protective coatings, and flame-priming steel for painting. Copies are available on request from the Bakelite Corp., 30 East 42nd St., New York, N. Y.

No "Rule of Thumb" Here in Selecting Construction Materials for Pumps . . . .

Fortunately for users of Amsco-Nagle Industrial Material Handling Pumps, the selection and production of "water end" metal most suitable for a given set of corrosive or abrasive conditions are no problems for Amsco. The Amsco division has for years produced heat and corrosion resistant alloy castings for many industries, including, in fact, manufacturers of pumps for the chemical and process industries; 13% manganese steel for users and makers of pumps handling abrasive materials; and other divisions of the company make almost any ferrous or non-ferrous metal likely to be required.



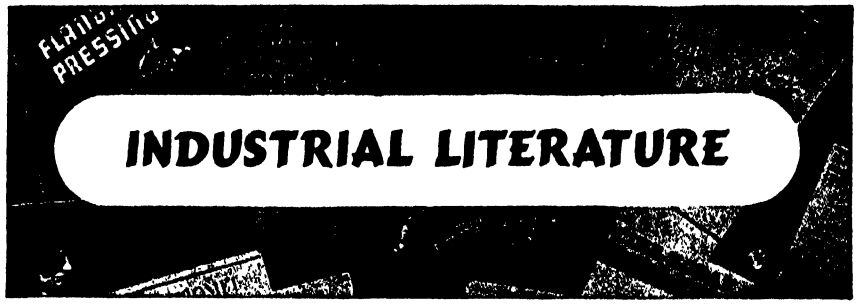
In addition to the chemical and physical testing laboratory and 400,000 volt X-ray inspection equipment maintained at our Chicago Heights plant, we participate in the activities and share in the "findings" of the extensively equipped Mahwah (N. J.) Metallurgical and Physical Research Laboratories.

Starting with a thorough knowledge of the correct alloy for the application, we produce the cast parts in our own plants and can, consequently, control the alloy analysis, as well as foundry practices, so as to insure sound pump castings.

When a purchaser specifies an Amsco-Nagle Pump, he has the advantage of single-company responsibility, from the production of drawings to the finished unit ready to put on the line. Our responsibility does not stop when we have recommended a certain grade of alloy, nor are we confined to a limited range of construction materials. Water ends, for example, may be of an alloy selected to resist a highly active acid, whereas the other parts may be of simpler alloys or ordinary cast iron.

Our long contact with the process industries in making heat, corrosion and abrasion resistant castings for cement mills, pulp mills, petroleum refineries, ore roasters and other operations has given us an insight into their pumping problems; and we may be able to work with you to our common advantage.

Bulletin 940 describes design details of Amsco-Nagle Pumps, and gives specifications and operating characteristic curves.



Amsco-Nagle 2" Type "SW" Frame 10D Vertical Shaft Wet Pit Pumps with Muntz metal and monel fittings made for a chemical manufacturer. Note inverted inlet to eliminate air and gas binding and to take advantage of hydraulic thrust in counterbalancing weight of revolving parts. Immersed bearings lubricated through tubular structural member at right.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Agitators—Clarifiers—Thickeners. This 16-page booklet covers general operating characteristics of the three types of equipment. Important construction features are illustrated, correct application of the different types of equipment to industrial problems is discussed, and data tables show the material handled, feed rates, and capacity information on typical operations. *Bulletin 31-C CEN.* HARDINGE CO., INC., York, Penna.

Blackout Ventilation. This bulletin discusses a line of power roof ventilators. Line drawings and photographs indicate the way in which these ventilators can be equipped with blackout hoods to prevent light from showing. *Bulletin 304 CEN.* ILG ELECTRIC VENTILATING CO., 2850 North Crawford Ave., Chicago, Ill.

Centrifugal Pumps. This 4-page data sheet lists the standard features of this line of single-stage pumps with capacities up to 200 gallons per minute and heads up to 300 feet. In addition to a general description of the line, the bulletin carries dimension tables and also a table of capacities, heads, and speeds. *Bulletin W-312-B2C CEN.* WORTHINGTON PUMP AND MACHINERY CORP., Harrison, N. J.

Compressors. Single horizontal, single-stage compressors with 9-, 11-, and 13-inch stroke, available in both motor- and steam-driven types, are described in this bulletin. Sectional views give the purchaser a good idea of the construction details, and a general data table lists sizes, dimensions, and capacities. *Specification L-640-S2 CEN.* WORTHINGTON PUMP AND MACHINERY CORP., Harrison, N. J.

Diesel-Electric Switcher. A 16-page booklet, profusely illustrated, describes a 25-ton Diesel-electric locomotive designed for use in industrial plants and said to embody many features found in railway-type switchers. *GEA Publication 3756 CEN.* GENERAL ELECTRIC CO., Schenectady, N. Y.

Electronic Photometer. The apparatus discussed in this bulletin is designed for the measurement of low light values and is a self-contained unit, built into a portable case. It is operated from the power line, without the use of batteries, and the amplifier circuit is stabilized so as not to be affected by line voltage variations. Phototubes for this photometer, available in a variety of spectral response, can be furnished with high sensitivity in the red and infrared as well as in the blue and near-ultraviolet. *Photovolt Electronic Photometer Bulletin CEN.* PHOTOVOLT CORP., 95 Madison Ave., New York, N. Y.

Heat Exchangers. This illustrated bulletin describes the A. P. V. plate-type heat exchanger designed for use with all types of liquids. In addition to ordinary heat transfer use, this equipment can be employed for the complete pasteurization of liquids, sirups, or oils by continuous process operation under sterile conditions. The essential working unit of the heat exchanger is an assembly of polished die-pressed stainless steel, or other suitable metal, plates with grooves on both sides, which when pressed together form a closed passage for the product and heating or cooling mediums. The ease with which additional plates may be added gives this heat exchanger unit a very high flexibility, permitting its adaptation to a variety of heat transfer jobs. *Heat Exchangers Bulletin CEN.* WALKER-WALLACE, INC., 14 West Utica St., Buffalo, N. Y.

Homogeneous Lead Coatings. This booklet discusses the facilities for applying and the products given homogeneous lead coatings. The equipment described ranges from lead-lined drums to impellers for high-speed agitators. An interesting series of photographs shows the preparation of work for lead coatings. *Bulletin 1700 CEN.* THE UNITED STATES STONEWARE CO., Akron, Ohio.

Liquid Density Recorders. Instruments for the automatic measurement and recording of densities of process liquids are described and illustrated in *Bulletin A-264 CEN.* THE FOXBORO CO., Foxboro, Mass.

Open Steel Flooring and Steps. A folder concisely describes patterns of gratings and their applications, and includes a tabulation of safe loads for various sizes, weights, and lengths of this type of flooring, details of constructions, and methods of installation, with photographs of typical installations. *Folder CEN.* KERLOW STEEL FLOORING CO., 21 Mallory Ave., Jersey City, N. J.

Research Chemicals. A 4-page booklet lists fine organic chemicals, including several rare bile acids, for research workers in the medical sciences. *Bulletin CEN.* GEORGE A. BREON & CO., INC., Kansas City, Mo.

Taste and Odor Control in Water Purification. This booklet, textbook in character, discusses developments in water-supply handling, sources of pollution, and the applications of activated carbon to reach a wide variety of conditions. It includes a description of granular carbon filters and other methods of odor control. *Taste and Odor Control in Water Purification Booklet CEN.* INDUSTRIAL CHEMICAL SALES DIVISION, WEST VIRGINIA PULP AND PAPER CO., 230 Park Ave., New York, N. Y.

Temperature and Pressure Controllers. This 36-page booklet gives information on the controllers themselves, as well as a series of photographs showing their actual application to industrial work. Two new instruments described are a non-indicating controller for temperature or pressure (No. 42) and a self-operating temperature controller which is said to find wide use where compressed air or electricity are not available. *Catalog 900E CEN.* C. J. TAGLIABUE MFG. CO., Park and Nostrand Aves., Brooklyn, N. Y.

Thermometers and Hydrometers. This 28-page catalog gives data on the working values in this line of instruments. In addition to detailed description and recommendations for application, the authors have included some valuable tables for conversion of specific gravity readings into pounds per gallon. Suggestions are given for using a hydrometer to get correct readings, and a handy selection chart lists hydrometers especially calibrated for more than 50 products. *Catalog C-40 CEN.* GEORGE RUEHFEL CO., INC., 103–105 Menahan St., Brooklyn, N. Y.

Vacuum Pumps. Problems of vacuum processing and installation of vacuum equipment are discussed in this 32-page illustrated catalog. Sound use of the equipment in high vacuum practice is covered. A line of Stokes high vacuum pumps described in this booklet ranges from 10 to 225 cubic feet in capacity. A new Devaporizer, designed to remove and recover low-boiling point solvents and other volatiles and prevent loss of vacuum in the system, is discussed, as well as new type portable high-vacuum gages, to meet the need for faster, more accurate readings in high-vacuum practice. *Catalog 38-P CEN.* F. J. STOKES MACHINE CO., Tabor Road, Olney P. O., Philadelphia, Penna.

Vent Valves and Flame Arrestors. This booklet, of particular interest to engineers whose plants must handle and store considerable quantities of volatile liquids and explosive gases, describes equipment designed to make containers gas-tight and prevent flame from entering the tank if vapors vented from it should become ignited. The flame arrestors described range from 2- to 10-inch sizes. *Catalog V-50 CEN.* OCECO DIVISION, THE JOHNSTON & JENNINGS CO., Cleveland, Ohio.

Vibrating Equipment for feeding, conveying, sifting, packing, cooling, and drying is covered in an 8-page illustrated bulletin. *Booklet 42 CEN.* W. RICHARD WITTE & CO., 220 Broadway, New York, N. Y.

"We Read Water in the Bottling Department" is the title of a 6-page pamphlet on bottling water problems. *Pamphlet CEN.* D. W. HAERING & CO., INC., Chicago, Ill.

Hammering Rivets by Radio

One of the most recent instruments is the "radio hammer" which is being used to accelerate certain phases of airplane construction and is described in an RCA publication. The rivets are adapted specifically to the fastening of metal plates accessible from only one side and it is expected that they will find much wider applications. In the cavity of the rivet shank is a small charge of TNT or other high explosive. When the rivet is heated to a critical temperature the charge is exploded, expanding the shank to fasten the metal sheets firmly. The size of the charge is controlled to such a fine degree that the expansions may be held within a range of 0.01 inch. The heat is applied by a short-wave coil known as a radio bombarder. Held against the head of the rivet it heats the rivet in two or three seconds and the explosion results.

Dehydrated Meat

The American Meat Institute has reported processes that will permit the dehydration of meat and reduce the amount of space required for shipping to the armed forces in foreign lands and to Lend-Lease recipients. These involve grinding, precooking, and drying in air dryers or vacuum, and are the result of intensive work by research laboratories of meat-packing companies, the American Meat Institute, and the U. S. Department of Agriculture.

Walnut Shells in Insecticide

Using an orchard waste as part of a protector for orchards, Forrest M. McLane of Montebello, Calif., has developed an insecticide in which walnut-shell flour is a carrier for rotenone. To the rotenone-impregnated shell powder is added a certain quantity of a nonvolatile, nondrying oil as an emulsifier, together with some diatomaceous earth as a filler. The whole is suspended in water and used as a spray. Patent 2,283,275 covers this mixture.

Bottle Crowns from Tin Cans

In an effort to increase its supply of crowns for bottles, the Pepsi-Cola Co. has collected about 10,000-old tin cans for experimental purposes and is building machinery to cut them at the seams and wash them. It is estimated that, if successful, the company will be able to stamp about 40 crowns from a No. 10 can.

Sidney P. Gottfried, assistant chemist in charge of the Division of Biochemistry of the Jewish Hospital of Brooklyn and connected with the hospital for seven years, has accepted a commission as first lieutenant in the Sanitary Corps of the U. S. Army.

Another Beckman pH Development . . .

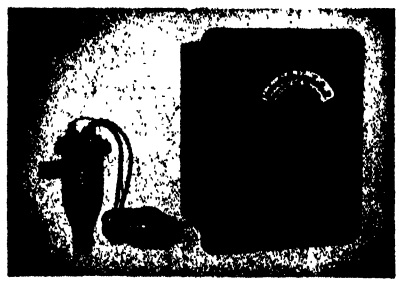
NEW X-9 GLASS ELECTRODE
Further Simplifies pH Control!

Withstands Severe Abrasion in Flow Lines, Vats, Tanks, etc., Insuring Longer Life, Lower Maintenance, Better pH Control!

Again another important "first" in the pH field is pioneered by Beckman research! Since Beckman pioneered the first rugged type glass electrode . . . an electrode that could be used directly in vats, tanks, flow lines, and even pushed into moist earths and semi-solids without injury . . . modern pH control has spread to more and more industrial applications where operating conditions are severe.

Now, Beckman research has developed a new, even *more* rugged electrode that withstands unusually severe operating conditions — high abrasion, shock, direct pressure — without damage. This new electrode . . . *the Beckman X9 Glass Electrode* . . . makes possible economical and convenient pH control under even the most difficult operating conditions in chemical and industrial processes. . . .

HIGH ABRASION RESISTANCE! The walls of the X-9 electrode are much thicker than those of ordinary glass electrodes . . . stand up under the severe abrasion of continuous operation in abrasive-laden fluids, flow lines, pulps, pastes and similar difficult applications.



UNUSUAL RUGGEDNESS! To withstand rough plant usage, this X-9 electrode has a ruggedness far above ANY glass electrode heretofore available. *It will withstand a direct push of more than 100 pounds without damage.* That means long life in even the roughest operations!

The X-9 Electrode can be used with all Beckman pH instruments — both automatic and manual. Get the full details from your dealer . . . or write direct!

America's most advanced pH equipment

No other make or type of pH equipment available today offers as many far-reaching advancements as BECKMAN ● It is the only glass electrode pH equipment that can be used for continuous operation on boiling liquids ● It is the only glass electrode pH equipment that can be used in highly alkaline solutions, even in the presence of sodium ions ● It is the *only* glass electrode pH equipment providing a multiple electrode switch, by means of which an accurate pH record of as many as SIX electrode stations can be maintained — *automatically and continuously* — by ONE pH instrument. These are only a few of the outstanding pH developments available in Beckman equipment exclusively!

Illustrated at left is the Beckman Automatic pH Indicator — the ideal instrument for modern industrial process operations. Operates continuously from 115 V A.C. mains (no batteries!) and can be installed to give not only continuous *Indication* of pH but also a written Record and completely automatic Control over the pH in your plant operations. Ask for Bulletin 16 which gives complete details on this outstanding instrument!

WORLD'S LARGEST MANUFACTURER OF GLASS ELECTRODE pH EQUIPMENT!

NATIONAL TECHNICAL LABORATORIES • SOUTH PASADENA, CALIF.

Beckman THE LEADING NAME IN pH

Second Edition ready July 6th

CHEMICAL REFINING OF PETROLEUM

by **VLADIMIR A. KALICHEVSKY**

Research and Development Laboratories, Socony-Vacuum Corpn.
Author of "Modern Methods of Refining Lubricating Oils"

and BERT ALLEN STAGNER, Ph.D.

Consulting and Research Chemist; Member, American Institute of Chemical Engineers;
Formerly: Supervisor Chemical Research, Union Oil Company of California;
Research Fellow, Mellon Institute of Industrial Research

American Chemical Society Monograph, No. 63
550 Pages. Illustrated. $7.50
Second Edition, Revised and Enlarged

THE rapid development of petroleum technology has necessitated a revision of the original volume published in 1933. The newest practice in regard to treatment with sulfuric acid, tetraethyl lead, octane rating, etc., is described in detail. The present emphasis on all phases of this vitally important subject makes this book a particularly timely one, especially since the petroleum problem today is rather one of refining capacity than of crude production. For this reason technical improvements are of the utmost importance for the pressing problems of national defense.

CHAPTERS

Prefaces
Composition of Petroleum
Treatment with Sulfuric Acid
Sulfuric Acid Sludge and Hydrogen Sulfide; Recovery and Manufacture of Sulfuric Acid
Treatment with Alkaline Reagents
Sweetening Operations, Elimination of Elemental Sulfur, and Reduction of Total Sulfur in Light Distillates
Chemical Refining of Petroleum
Refining by Adsorption
Refining with Solvents
Detonation and Antidetonants
Inhibitors of Atmospheric Oxidation of Petroleum Products. Antioxygens
Gums and Cracked Petroleum Products
Deterioration of Lubricating and Similar Oils. Additional Agents
Supplementary List of United States Patents on Petroleum Refining
Appendix. Special Tables
Patent, Author, Subject Indices

REINHOLD PUBLISHING CORPORATION, 330 W. 42nd Street, New York, N. Y.

H-VW-M Adds to Plant

THE Hanson-Van Winkle-Munning Co., Matawan, N. J., is building an addition to its electrical department, in order to improve the storage and loading facilities for large electrical and mechanical equipment used in war production installations. This extension has been necessitated by the increased production demanded by the war program under which the electrical department has gone on a 7-day, 24-hour, 168-hour per week basis.

Plastic Highway Reflectors

NIGHT automobile accidents are reduced 20 to 25 per cent on Michigan highways marked by plastic reflectors molded of Lucite methyl methacrylate resin, the State Highway Department has reported after a four-year survey. The delineators are the nearest approach to highway illumination without the use of expensive direct lighting that has yet been attained, the report says.

Each delineator is formed of three plastic disks, molded of Lucite, made by the du Pont Company, Wilmington, Del., and set in a vertical line in a metal housing atop a three-foot post. The reflectors are shatter-resistant lenses with many facets. The delineators are spaced at intervals of 100 feet along the highway. They are placed 8 feet from the pavement edge in rural areas and 4 feet in urban areas where the road surface is bordered by a curb.

Radiation Pyrometer

A RADIATION pyrometer known as the Pyrovac has been developed by The Bristol Co., Waterbury, Conn. The new instrument is designed for recording, indicating, or automatically controlling temperatures in furnaces and kilns above 900° F. The temperature-sensitive unit or radiation head is mounted on the outside of the furnace out of the hot zone where it picks up heat rays emitted from the object under measurement, thus registering its surface temperature. The pyrometer is intended for use in measuring and automatically controlling high temperatures out of the range of the thermocouple; temperatures for which rare-metal thermocouples are used; surface temperatures; and those where the object is moving, is inaccessible, or there are space limitations.

The new line is described in Bulletin P1102, available from the company.

Design Assistance on Wood Water Towers

SINCE a War Production Board decision declines priorities for steel to be used in the construction of water towers, the Timber Engineering Co., Washington, D. C., offers aid in designing wood towers for water tanks. It also has in preparation a design for a 100-foot tower to carry a 100,000-gallon wood tank.

Megohm Bridge

TO MEET the growing demand for industrial resistance measurements of the order of ohms $\times 10^{12}$ specific resistance, with simplicity, accuracy, and economy, Industrial Instruments, Inc., 156 Culver Ave., Jersey City, N. J., announce the new Model MB-8-L megohm bridge. Although specifically designed for studies of Stoddard type cleaning fluids, with measurements obtained at low direct current voltage, eliminating fire hazard when working with flammable materials, this bridge will find other uses, particularly in organic chemistry.

Blackout and Shatter Screen

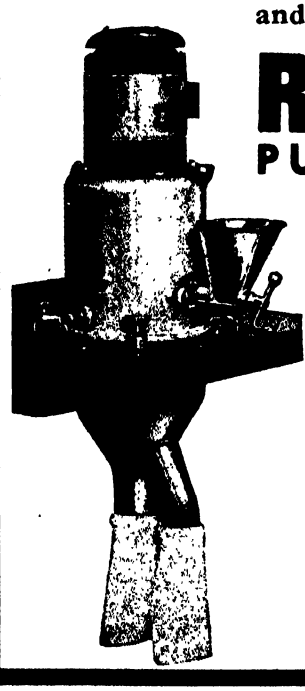
FLYING glass has been the principal cause of casualties in bombed areas, declare English air raid wardens.

The Research Products Corp., Madison, Wis., has developed a research blackout and shatter screen which successfully passed repeated explosion tests. The screen is a porous blanket made up of 16 layers of black flameproof expanded fiber and 4 layers of light-colored flameproof expanded fiber, mounted in a light wooden frame.

Test Separations

can be quickly made on fine particle size products to any desired degree of classification with the Raymond

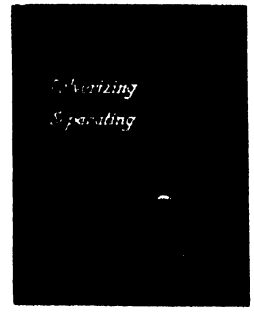
LABORATORY AIR SEPARATOR



It is useful for the separation of chemical powders, food products, cement specimens, ceramic materials, or, for that matter, any finely divided material whether in the natural or manufactured products field.

The machine is particularly well adapted for experimental work such as engaged in by Chemical and Industrial Laboratories, Government Testing Stations, Universities and Research Institutions.

This compact motor driven unit comes mounted on a metal base and includes a hand operated feeder.



Complete set of whizzers and fans furnished for regulating the fineness of the finished material. Separator is easy to take apart for cleaning and to make adjustments for changing fineness.

The full line of Raymond Laboratory Mills and Separators is described in the Bulletin.

Elastic Stop Gang Channel Nuts

ELASTIC stop gang channel nuts, widely applied in the aircraft industry, are offered by the Elastic Stop Nut Corp., 2332 Vauxhall Road, Union, N. J., for testing in general industry where a multiple, self-locking, bolted fastening is required. These strips of self-locking nuts have the approval of the military and civil air authorities and are used on all American-built military and transport aircraft, on fuselage and wing structures, engine cowlings, cover and inspection plates, around windows and doors, and at other points where a series of fastenings is required.

The strips are factory-assembled, and it is necessary only to rivet or otherwise fasten them to the structure where they are to be used.

Cold Room Air Conditioner

COLD room air conditioners providing constant temperature as low as −50° to −80° F. are available for manufacturers required to test or normalize parts, materials, and machinery at such temperatures, and for experimental laboratories.

It consists of coolers operated in stages, the first stage reducing to temperature just above the freezing point of water and removing humidity; the second stage using the Niagara no-frost method to remove the balance of the moisture; and the third stage producing and holding the required final temperature.

Moisture is removed from the air below 32° F. without causing formation of ice on coolers by employing a special nonfreezing liquid continuously reconcentrated in a concentrator designed especially for this duty. The equipment is manufactured by the Niagara Blower Co., 6 East 45th St., New York, N. Y.

Extruded Synthetic Glass Sealer

THE Presstite Engineering Co., St. Louis, Mo., has developed a sealing compound especially designed to seal joints and seams in aluminum construction and to provide good adhesion to synthetic glass.

Joints sealed with this compound are tight for air, water (salt), 100-octane gasoline, aircraft fuel, and motor oil. It will remain flexible and not lose its adhesion at extremely low temperatures.

Insecticide Concentrate

A NEW insecticide concentrate for contact sprays for which there is a large domestic source of supply is announced by the Naval Stores Department of Hercules Powder Co., Wilmington, Del. The concentrate, known as "Thanite", is effective in low dilutions and requires no other toxic agent or activator for fly sprays, the company says.

The material, a derivative of the southern pine, which assures a dependable supply, is the thiocyanoacetate of a secondary terpene alcohol.

Arc-Welding Electrode

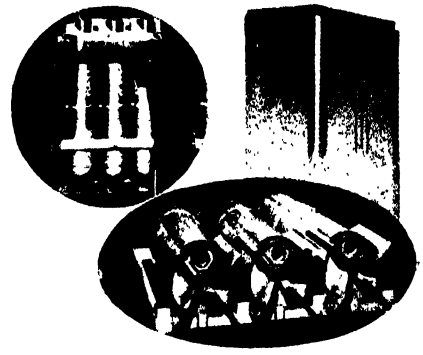
AN ALL-POSITION, high-quality alternating-current electrode, Type W-26, extending the advantages and convenience of high-quality alternating-current welding to both vertical and overhead positions, has been announced by the General Electric Co., Schenectady, N. Y.

Alternating-current arc welding has already demonstrated its advantages for work in the horizontal and flat positions. The W-26, developed after intensive research, fulfills a long-felt need for a vertical and overhead alternating-current welding electrode.

Oil Tank Sealing Compound

A ZINC chromate fuel and oil tank sealing compound has been developed by the Presstite Engineering Co., St. Louis, Mo., and is furnished in extruded form in various thicknesses and widths. The sealer is said to be highly adhesive to metal surfaces, even in the presence of liquid hydrocarbon, to have extreme resistance to drying and evaporation, and to be non-oxidizing and nonpolymerizing.

Reichhold Chemicals Awarded Treasury Flag



REICHHOLD CHEMICALS, INC., Ferndale, Detroit, has been awarded the Treasury Department certificate and flag which signify that over 90 per cent of its employees are buying United States war bonds through the company's pay roll savings plan.

Employees at two of the factories, Detroit and Elizabeth, N. J., are 100 per cent on the pay roll savings plan, and pay roll deductions for the purchase of war bonds amount to approximately 10 per cent of the company's monthly pay roll.

Conductivity Checkup

INCREASED wartime production coupled with a growing shortage of trained manpower is being met in large part by the electrical conductivity checkup of solutions, condensates, and processes. Industrial Instruments, Inc., 156 Culver Ave., Jersey City, N. J., has developed several electronic instruments which bring accuracy in the form of rugged instrumentation to the average factory worker.

Three Simultaneous Brazes

THE problem of brazing a 0.75-inch threaded flange into a completely closed 20-gauge sheet steel container was solved by the Induction Heating Corp., 389 Lafayette St., New York, N. Y. Inductors, energized from a Model 1070 thermonic induction generator, were placed directly over the flange and caused heating of the flange and a small area of the sheet steel container. With this process it was possible to perform three brazes simultaneously in 35 seconds. A preplaced ring of silver-alloy melted and flowed to form a perfect, air-tight joint.

WANTED

CHEMISTS AND CHEMICAL ENGINEERS

To Register in the Employment Clearing House

Time—September 6-11, 1942 ***Place—Buffalo, New York***

Open only to members and paid student affiliates of the American Chemical Society registered at the meeting. Request forms from the AMERICAN CHEMICAL SOCIETY, 1155-16th Street, N. W., Washington, D. C.

For further details, see CHEMICAL AND ENGINEERING NEWS, June 10, page 724.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $3.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

RUBBER CHEMIST, experienced in compounding rubber, wanted for research on sealing materials used for hermetic closures. Good opportunity for young, aggressive, well qualified chemist. Middlewestern location. In reply give full particulars of training and experience, draft status, and salary desired.
Box 50-T-5, Ind. & Eng. Chem., Easton, Pa.

PACIFIC COAST college has an instructorship or assistant professorship for a man with physical and analytical training. Ph.D. preferred.. Genuine interest in teaching, and in the aims of Christian education in a liberal arts college demanded. Give full details of training and experience, and state minimum acceptable salary.
Box 80-T-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: Well trained young chemist, Ph.D., for work largely in analysis and standardisation of new drugs. Salary commensurate with qualifications. Give details of education, experience, references, etc.
Box 21-NP-6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, draftsman, experienced in Ethyl Alcohol plant work, to assist in laying out plans and in erecting new plant. Later to continue in production supervision. Write full details and submit photograph.
Box 25-N-6, Ind. & Eng. Chem., Easton, Pa.

METALLURGICAL CHEMIST: Recent graduate or several years' experience in sheet steel fabrication and drawing. Company engaged in both vital defense and non-defense activity. Excellent opportunity to establish and develop production control and research. Eastern location.
Box 29-NP-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, either woman or draft-deferred man wanted for industrial fellowship in dairy products research in Eastern public research institution. Salary $2100 per year. Give age, education, experience, nationality, photograph and references.
Box 31-T-6, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST: Research Department heavy chemicals plant Detroit area. Draft exempt man or woman. Industrial experience or advanced degree preferred. Adaptability varied work; development new methods required. Mention training in specialized analytical techniques. Enclose photograph. Salary commensurate with qualifications.
Box 35-T-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST: Recent organic Ph.D., preferably with some background and interest in cellulose, papermaking or synthetic resins. Permanent opportunity with large chemical research laboratory for man with ability and initiative. Send photograph.
Box 40-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER INORGANIC FIBRE FIELD

A leading manufacturer in Eastern Pennsylvania has opening for Chemical Engineer, B.S., M.S. or Ph.D. 28 to 42 years of age with several years of research and development experience preferably in inorganic fibre field. Excellent salary.

Box 34-TP-6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEERING instruction and research: new position; teaching includes Engineering Materials (chiefly Metallography) and other courses of interest; research on important defense problems as well as long-range attack on fundamentals. Reply with qualifications, personal data, and snapshot. A. P. Colburn, Professor of Chemical Engineering, University of Delaware, Newark, Delaware.

ASSISTANT and FELLOW in Chemical Engineering. Duties include assistance in laboratories and in special research projects; pay, $642 for 10 months; graduate work stressed include unit operations and plastics. Reply with qualifications, personal data, and snapshot. A. P. Colburn, Professor of Chemical Engineering, University of Delaware, Newark, Delaware.

RESEARCH CHEMIST. We have an opening in our research laboratories for an organic chemist of proven creative ability. A substantial salary will be paid to a man with the necessary qualities.
Box 46-TP-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer. Preferably with some industrial experience, for research and development in laboratory of midwest concern manufacturing feeds and other agricultural products. Farm background desirable but not essential. Salary determined by ability and experience. State qualifications fully.
Box 48-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, organic and analytical, wanted by well-known midwestern company engaged in manufacturing cosmetics and specialties, for routine control and research. Woman or draft deferred man under thirty-five to replace man entering service. Salary commensurate with ability and experience.
Box 53-T-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST. Excellent opportunity for a chemist who has had several years experience in actual formulation of thermosetting and thermoplastic resins for laminated products and also in paints and coatings. One having had experience with paper products preferred but not essential. Should be creative and capable of going ahead with assigned work. Correspondence held strictly confidential.
Box 75-TP-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST having had varied experience in thermosetting and thermoplastic resins. One familiar with synthetic lamination of sheets preferred. Creative work appreciated. Splendid opportunity. Correspondence confidential.
Box 76-T-6, Ind. & Eng. Chem., Easton, Pa.

ENGINEERS
FEMALE

Mechanical and Electrical Engineers needed by well known large manufacturer of radio and communication apparatus. Fine opportunity in established engineering group for qualified candidates. Openings in physical and electrical laboratories on technical and special engineering tests, work on filters, equalizers, amplifiers and test set designs requiring good knowledge of fundamental circuits and electronics; also planning for manufacture of product, analysis of parts, machine and tool facilities, and preparation of manufacturing layouts.

Require engineering graduates of high standing from accredited engineering colleges; also will consider outstanding candidates with A.B. Degree in mathematics and physics. Experience desirable but not necessary if recent graduate.

Write stating age, education, experience, place of birth, attach snapshot (not returnable). Box 681, Suite 1800, Times Building, New York.

WANTED: INORGANIC Chemist, M.Sc. required; and Physical Chemist, M.Sc. required, Ph.D. preferred. Rank and salary dependent upon qualifications. State full qualifications, and salary expected. Write G. C. Brous, Chairman, Department of Chemistry, Hofstra College, Hempstead, New York.

FELLOWSHIP AVAILABLE to organic-physical chemistry candidate for Ph.D., who is qualified to make physical measurements on products of the wet milling industry, as thesis requirement. Carry, 6 hrs. course work. Pay, $60.00 per month. Apply to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Indiana.

Technical Market Analyst

Well-established company is in need of a technically-trained man familiar with industrial products and their manufacture to make surveys and prepare reports on uses and markets for chemical products, metals and equipment for processing them. Send all information, including experience record, age, marital status, etc.

Box 90-T-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH DIRECTOR, Los Angeles independent commercial research laboratory. Ph.D. broad experience, training in biological chemistry particularly foods, nutrition and pharmaceuticals. Good character and personality essential. Married man or mature woman. Give training, experience, nationality, draft status, age and personal data, also recent photo.
Box 94-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEERS Positions open in defense industry. One opening for graduate chemical engineer with crystallization and evaporation experience; explosive or munition plant experience; preferred age limits 30 to 45. Three openings for graduate chemical, mechanical, or electrical engineers with plant experience; age limits 25 to 35. Two openings for junior graduates (2 years college) of chemical engineering or applied chemistry; age 20 to 25. Write us giving brief outline of education, experience, and salary acceptable. Enclose photo. Nebraska Defense Corporation, Nebraska Ordnance Plant, Mead, Nebraska.

(Continued on page 834)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

UNUSUAL IMMEDIATE opportunity for capable, energetic, recent Ph.D. in Organic Chemistry with keen interest in Pharmaceutical research. Opening chemical concern Metropolitan New York area. Give full particulars in first reply, including details academic training, industrial experience if any, salary expected and draft status.
Box 101-TP-6, Ind. & Eng. Chem., Easton, Pa.

Opportunity

WITH Manufacturing Chemists, in Eastern Penna. for wide awake Chemist with experience and new ideas for developing new products for textile and allied trades. State age, draft status, nationality, religion, experience, present employment, references.

Box 102-TP-6, Ind. & Eng. Chem., Easton, Pa.

DYESTUFF CHEMIST

An old established dyestuff manufacturing company wants a chemist with practical vat dye experience, especially vats used for Government Khaki. Do not apply unless you have practical vat experience. Reply should give full details and be held in strict confidence.

Box 103-TP-6, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SPECIAL LIBRARIES ASSOCIATION will recommend trained chemical and technical men and women librarians at no cost to employer or member. Competent persons are now available. Write to the Executive Office, 31 East Tenth Street, New York, New York, for additional information.

CHEMIST PHARMACEUTICAL Organic, training in Pathology and Physiology. Graduate work 4 years, Research assistant 3 years, now operating own successful organic synthetic lab. 2 yrs. Wide experience in analysis, research, production, and sales. Honor societies, publications.
Box 26-T-5, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL RESEARCH, development position wanted by Ph.D., physical chemistry, 1941 Doctoral research in precision calorimetry. Publications. Year experience in plastics. Phi Beta Kappa, Sigma Xi. Age 25. Married. 3-A draft classification. Willing locate anywhere.
Box 54-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Cornell, B.Chem. 1939, Ch.E. 1940, single 23. Two years' experience development work on organic chemicals, methanol, ammonia. Any location, available immediately. Defense work preferred; principally interested in process development, improvement of existing processes; production if defense industry.
Box 66-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S. in Physics. Two years' production experience in chlorine, caustic, chlorinated hydrocarbons. One year in refinery pilot plant. Now analytical chemist in aircraft plant. Desires position where his abilities can be utilized fully. Married, Protestant. Middle West preferred but not essential.
Box 12-N-6, Ind. & Eng. Chem., Easton, Pa.

YOUNG CHEMICAL engineer, B.S.Ch.E. '42, desires position connected with defense. Part time and summer work in food, wax paper, and plastic coatings. Undergraduate thesis in petroleum research. High scholastic standing. Available June 2.
Box 17-N-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, Ph.D. leading Midwest University. Major organic and minor physical chemistry. Held teaching fellowship four years, full time instructor in organic chemistry. One year at large midwest university. One year industrial research experience. Married, 28, Protestant, favorable draft status; member several scientific fraternities. Available on short notice.
Box 33-N-6, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST M.S. Michigan. Single, 41. Twelve years' experience in explosives, rubber, steel, chemicals, paper. One year government explosives inspector. Had charge of two laboratories. Eastern U.S.A. wanted but will consider other locations. Performed research on inorganic problem. Prefer war work.
Box 38-N-6, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL PHYSICAL organic chemist, Ph.D., May 1942. Thorough undergraduate training in organic, inorganic, physical chemistry. Graduate work in pharmaceutical chemistry. Teaching assistant, graduate fellowships. Desires teaching or industrial research. Publications. Phi Beta Kappa, Sigma Xi. Age 25, single, draft deferred, available immediately.
Box 48-N-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. 1942. Minnesota. Biochemistry major, organic chemistry and bacteriology minors. Has had intensified course in production and handling of explosives and interested in employment in this field. Personal qualifications and references of high quality. Single, Protestant, age 22. Temporary deferment 2-A. Read chemical German. Location immaterial.
Box 50-N-6, Ind. & Eng. Chem., Easton, Pa.

PRODUCTION CHEMICAL Engineer, experienced in directing manufacture of inorganic and organic chemicals. Development background. Familiar with process equipment, costs, maintenance, record keeping. Age 36.
Box 53-N-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, Ph.D. Pharmaceutical, analytical, portland cement. Seven years' diversified experience in American Medical Association Chemical Laboratory; industrial experience in amino acids manufacture, as pharmaceutical control chemist, and in research in portland cement laboratory. Five years' university teaching. Minors, organic chemistry and physics. Married, dependents.
Box 56-N-6, Ind. & Eng. Chem., Easton, Pa.

PROFESSORSHIP, RESEARCH, director, woman, Sc.D. Johns Hopkins; M.S. Chicago. 14 years' teaching experience, biochemistry, organic, food, colloids, physical. 6 years as director. Excell in ability to create interest.
Box 10-T-6, Ind. & Eng. Chem., Easton, Pa.

PETROLEUM CHEMIST and Technologist, Ph.D. 1931, now employed, available reasonable notice. Age 40, married, two children. Ten years' experience mainly on lubricants; less on gas reactions and motor fuels. Publications. Prefer research and development work.
Box 15-T-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Teaching and 3 years' industrial research and development experience (pharmaceuticals), desires permanent position in the East. Employed but available within reasonable notice.
Box 16-T-6, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, 5 yrs. extensive research experience on surface and colloid chemistry of pigment materials in addition to photochemical and solid-gas reaction investigations. M.S. degree, draft deferred, 28 yrs. old.
Box 17-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S., M.S. Want research or analytical work. Three years' experience in Viscose Rayon production. Prefer cellulose industry. Age 37, married, 3A selective service classification.
Box 19-T-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1935, age 30, draft 3-A, desires research or development position. Five years' experience in synthetic resins and plastics. References. Location immaterial.
Box 21-T-6, Ind. & Eng. Chem., Easton, Pa.

INORGANIC CHEMIST, Ph.D. Interested in research, industrial or teaching position. Age 42. Married. Honor societies and publications. Over 20 years' college teaching experience, chiefly inorganic and analytical. Consulting, research, analytical and administrative experience. Immediately available.
Box 22-T-6, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D., 1939, Hormones. One year post-graduate fellowship, two years' research pharmaceutical specialties with small house, now employed. Desires research position with opportunity for increasing responsibility. Age 29, married, two children.
Box 23-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D. Unusual varied and sound background. Research, new product development, productions. Now employed. Available on reasonable notice.
Box 24-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, BIOCHEMIST, M.A., Sc.D., assistant professor of biochemistry, now employed, wishes research, teaching, or responsible industrial position, reasonably permanent. 10 years of laboratory research and teaching in biochemistry, nutrition. 37 publications. Married, age 36. Status 3-A. Member four national professional societies.
Box 26-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST. Eight years' experience in food, water, fermentation especially brewing fields. Expert analyst. Know all phases of laboratory design and control. Draft deferred. Now employed, seeking more promising position.
Box 28-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D. Ten years' experience in development and control in foods, drugs and cosmetics. Now in good institutional position with limited advancement prospect. Draft class 3-A. Salary minimum $4000-$6000 depending location.
Box 29-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, university graduate, twenty years excellent record in research, development, service and sales; publications, patents, sales and advertising literature, new products and new uses; desires active and responsible position; references from all employers; listed in American Men of Science; 3-A draft classification.
Box 30-T-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. June 1941. Age 28, American. At present engaged in industrial research work. Desires new research or development position, preferably in essential defense industry. References and personal history on request. Available July 1st.
Box 33-T-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.Ch., A.C.S., accredited university with undergraduate training in biochemistry, 5 years' experience in industrial catalytic cracking research. Patents. Supervisory experience in plant operation. Age 32, married, employed, draft 2A. Desires employment west of Mississippi, preferably in the Rocky Mountain States.
Box 36-T-6, Ind. & Eng. Chem., Easton, Pa.

Here is an ORGANIC CHEMIST, well trained in research, development, and general production, who desires a change to a position where his abilities could be more fully utilized! Has degrees in engineering and chemistry in addition to a very diversified experience of over a six year period. Can you offer this man an opportunity which would prove mutually beneficial?
Box 37-T-6, Ind. & Eng. Chem., Easton, Pa.

ASSISTANT PROFESSORSHIP in chemistry wanted by chemist, Ph.D., now holding responsible post in industry but who prefers teaching with chance for independent research. Experienced teacher. Well trained in organic, physical and analytical chemistry. Many publications and patents. Sigma Xi. Age 35, married.
Box 38-T-6, Ind. & Eng. Chem., Easton, Pa.

EXECUTIVE, CHEMIST, Engineer. Experienced research, process development, plant supervision, purchasing, patents. Desires position of laboratory or plant executive or technical assistant to general executive. Age 49 years. American Citizen. Married. Knowledge of French, German and Russian languages. Location immaterial. Presently employed. Prefers defense work.
Box 39-T-6, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., desires industrial research, or teaching in institution offering opportunity for research. Doctorate in electrochemistry, strong background in physics. Publication. Sigma Xi, Phi Lambda Upsilon. Now university research associate; available September. Age 28, married, dependents.
Box 41-T-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.A., 1941, A. C. S. accredited university. Employed for past year doing successful research and development for civilian concern. Desire change to research or production work for a defense industry. Location immaterial. Single, 24, draft 2-A.
Box 42-T-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and DEVELOPMENT chemist with outstanding training and experience in producing, refining and every kind of treating of vegetable and animal oils and fats, and in all the industries based upon the use of oils. Reducing refining losses. Solving unusual problems.
Box 47-T-6, Ind. & Eng. Chem., Easton, Pa.

RECENT GRADUATE, B.S. Chemistry, Catholic university. Organic chemistry work preferred but will try anything. Not yet registered for army draft, available immediately for service in any part of the country, Washington, D. C., area preferred.
Box 49-T-6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH or TEACHING position wanted by organic and physical chemist Ph.D. Extensive experience in research and teaching at prominent university (Ass't Professor) and research institutes teaching graduate courses and directing Ph.D. researches. Numerous publications in physical and organic chemistry. Research involves absorption and emission spectra, fluorescence, Raman spectra, polarography, optical activity, calorimetry, etc., and their application to organic and biological problems. Organic synthesis, qualitative and quantitative organic microanalysis. Administrative ability. First citizenship papers, age 42, married. Available September 1. Location immaterial.
Box 50-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. Technical administrator. Top graduate, top school. 12 years' experience chemical engineering all phases, petroleum, ethyl alcohol. 7 years' as executive, technical administrator, manager above fields. Successful record of accomplishments. Good appearance. Best references. Available immediately. Age 33. Married.
Box 51-T-6, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D. summer 1942. Research on overvoltage, minor theoretical physics, desires industrial research position. Available mid July. Single, 22. Belgian native, American citizen. French, German. Twice deferred in the draft. Sigma Xi. Phi Lambda Upsilon. Location immaterial.
Box 52-T-6, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 835)

(Situations Wanted Continued)

CHEMIST, M.S., one year industrial experience. Desires position in research, production, or development, preferably organic. Eastern location, particularly New Jersey, preferred. Age 27, single, draft deferred. Available immediately.
Box 56–T–6, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, PH.D. 1942. Leading midwestern university. Broad basic training in science. Excellent background in biology and physiological, organic, and analytical chemistry; also 5 years of research experience with plant pigments. Specialized courses in nutrition, vitamins, sterols, carotenoids, enzymes, and physiology of humans, plants and bacteria. Interested in biochemical research. Age 27, married, draft 3A. Sigma Xi, Gamma Alpha. Available immediately.
Box 57–T–6, Ind. & Eng. Chem., Easton, Pa.

TEACHER, PH.D. Well qualified in physical, analytical, inorganic and industrial chemistry, chemical microscopy, etc. Thirty years' experience, half teaching, half industrial research, consulting, testing. Many publications. Employed. Available summer or fall.
Box 58–T–6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. Desires research position. Experience: development of pharmaceuticals, research on sterols, amino-acids, synthesis of phenols diazo-compounds. Familiar with organic micro-technique, microbiological work, pH control, electro-spectrophotometry. Draft deferred, dependency.
Box 61–T–6, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC Chemist B.A. chemistry, M.S. zoology, eastern university. 16 months' experience in analytical control (60% control, 40% research and development) in petroleum synthetics. Age, 24, responsible. Desires position preferably in production or research. Now employed.
Box 63–T–6, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, B.S., Columbia. Fellowship study at University of London. Doctorate in pharmaceutical chemistry. Excellent industrial and federal experience, 2½ years. Control, research, formulation, professional literature writing, laboratory direction. Knowledge production. Age 29. Sigma Xi. Publication. Now employed. Draft 2-B. Desire position having future with company contributing to war effort.
Box 64–T–6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, 29, Columbia graduate, 1937. Graduate organic medicinal chemistry in England. 1½ years' with pharmaceutical manufacturer. Year in U. S. government laboratory. Industrial experience in research, control, direction, professional writing. Knowledge unit processes in organic synthesis. Honor societies. Publication. Now employed. Draft deferred. Prefer responsible position in essential industry.
Box 65–T–6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST: 30, married. Ten years' research, analytical, and plant experience chiefly in the manufacture of pharmaceuticals and aromatics. Desire employment as a defense worker at any nominal salary.
Box 77–T–6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH, DEVELOPMENT and production chemist, M.S. degree, desires making change. Well versed in development, production and sales of special adhesives. 15 years' experience. Locality not essential.
Box 78–T–6, Ind. & Eng. Chem., Easton, Pa.

APPLIED RESEARCH. New trade products for 11 years; developed in food, biological and pharmaceutical laboratory investigations. Experimental process pilots for vitamins, hormones and amino acids also published scientific reports. By-product and food chemicals for market formulae. Control and sales requirements with clinical applications of infant food preparations Trained (M.S., Ph.D.) and experienced manager seeks active post associated with food institute or industry in New York area. Age 37. Family, 3-A, service waiver not granted.
Box 80–T–6, Ind. & Eng. Chem., Easton, Pa.

PETROLEUM CHEMIST. Broad experience in the development and manufacture of petroleum specialties, such as soluble cutting oils, metal soaps, sulfurised oils, and naphthenic acids.
Box 83–T–6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER B.S. 4 years' experience in process development and survey. Desire similar position or giving technical assistance to production department. Primary consideration is to be of optimum value to the war effort and, therefore, would be willing to consider a temporary position in production. Location and conditions immaterial. Salary commensurate with responsibilities. Single. Now 2-B.
Box 85–T–6, Ind. & Eng. Chem., Easton, Pa.

INORGANIC CHEMIST, M.S. This summer available immediately. Research on boron compounds. Thorough knowledge of inorganic, organic and chemical engineering. Some experience. Location immaterial.
Box 87–T–6, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. 1942. Excellent background in physiological chemistry, organic chemistry and physiology. Courses in toxicology, bioassays, spectroscopy and microanalysis. Research experience in fats, oils and fatty acids. Interested in organic or biochemical research. Age 27, single, draft 2A. Sigma Xi, Phi Lambda Upsilon.
Box 91–T–6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. 1940, industrial experience with wide responsibilities. Desires position, preferably research, in organic field, with company contributing to war effort. Favorable draft classification. Age 24. Employed.
Box 95–T–6, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. 1936, wishes teaching or research position in college or university. Graduate major, biochemistry; minors, general chemistry, bacteriology, physiology. B.S. degree in pharmacy. Five years teaching in medical school. Agr. Exp. Station experience. Publications on metabolism of minerals, and of amino acids, clinical chemistry. Married, age 31. Draft Class 3.
Box 99–T–6, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

CHEMICAL ENGINEER, eight years' experience in research, development, specification, applications of vinyl type resins and coatings. Interested in plastics and synthetic rubber. B.Ch.E., M.Sc., age 31, married, class 3-A, Protestant, employed non-defense.
Box 119–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 25 years' experience, plant layout and operation, organic. Research, Coal coke, petroleum coke, toluol, naphthaline, tar acids, intermediates, dyes, dry colors, aniline oil, synthetic coatings, varnish, carbon black. Protestant. American.
Box 61–N–6, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, M.S. organic, research fluorene series. Two years' experience in small plant where responsibility for vitamin and hormone ampoule production, limited facilities demand skillful technique, rigid control; encourage familiarity with pertinent problems of research, processing and development not common to routine large-scale production. Twice deferred, present work nonetheless non-essential. Who needs such a man more than the army?
Box 11–T–6, Ind. & Eng. Chem., Easton Pa.

CHEMICAL ENGINEER, Ph.D., with 4 years' successful development experience in synthetic organic field and in cereal foods industry desires to contact organization requiring man with imagination and broad practical knowledge in addition to sound technical training, for either development or production work. Especially interested in synthetic rubber and petroleum fields. Tau Beta Pi, Sigma Xi, married, 3-A, now employed.
Box 12–T–6, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL RESEARCH chemist, 10 years' experience in development work. Now successfully employed, but desires more responsible position with pharmaceutical or similar firm offering good future. Married, 2 children. American, Protestant, 34 years, 3-A draft rating.
Box 13–T–6, Ind. & Eng. Chem., Easton, Pa.

MECHANICAL ENGINEER. Five years' development work, large chemical company. Experience includes many types chemical plant equipment in corrosion resistant materials. Honor graduate leading Eastern university. Age 28, member A.S.M.E., married, draft class 3-A, U. S. citizen. Prefer location East of Rockies.
Box 25–T–6, Ind. & Eng. Chem., Easton, Pa.

FERMENTATION CHEMIST, B.S., 10 years' control labs., research and production; now in third year as production manager, 33, native, married, 3-A.
Box 27–T–6, Ind. & Eng. Chem., Easton, Pa.

PHYSICIST, Ph.D. Johns Hopkins 1941, Research experience: Electronoptics, X-rays, Physical chemistry. Considerable teaching experience with under-graduates and in defense courses. 4 years' in U. S. A., first citizenship papers. Draft deferred, dependency. Age 28. Sigma Xi. Preferred teaching position with research possibilities.
Box 43–T–6, Ind. & Eng. Chem., Easton, Pa.

DEVELOPMENT and RESEARCH chemist. B.S. Excellent training and experience. Ability to initiate and direct research. Four years' diversified experience on plastics, synthetic resins, organic chemicals and pigments. Draft deferred. Location immaterial. Available immediately.
Box 55–T–6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. 1941. Physical background, colloid and analytical experience. Desires position in Middle West. Industrial research or development, or academic position. Draft deferred, married. Available on short notice.
Box 62–T–6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. Experienced in organic and biochemical research, development, analysis, and supervision of plant operations. Will consider moderate salary if good opportunity. Good references. Citizen, deferred. Married Immediately available. Any location.
Box 66–T–6, Ind. & Eng. Chem., Easton, Pa.

ASPHALT TECHNICIAN, 29, B.S. (Ch.E.) 1935. Two years' production and three years' research on heavy oil products with major oil company. Nearly two years now doing research and development work on asphalt roofing, flooring, etc., with large building products firm. Desire change to midwest or south. 3-A, two children. Protestant.
Box 74–T–6, Ind. & Eng. Chem., Easton, Pa.

EXECUTIVE CHEMICAL engineer, B.E., with outstanding record in increasing production through administrative and technical improvements. Successful patent prosecutions. Member A.I.Ch.E. Position must be permanent. Age 34. Employed. 3-A draft.
Box 79–T–6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 12 years' experience in design, installation, operation synthetic organic chemical plants. Distillation, catalytic dehydrogenation, hydrogenation, development, process design, project engineering, including intimate knowledge of process for butadiene from alcohol. Desire permanent position in production, plant engineering, or design. Employed. Married. Draft 3-A.
Box 81–T–6, Ind. & Eng. Chem., Easton, Pa.

ANALYST SPECTROGRAPHIC: White, male, just completed 16 weeks ESMDT Spectroscopy course, U.S.C., no experience, married, 56, B.S. '09. Location immaterial for war industry. Salary your schedule.
Box 82–T–6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, over thirty years' experience developing modern Gutsert method, colloid chemistry of gelatine, dipyridyls, neonicotine (anabasine), nornicotine, nicotine bentonite, and now coordinated nicotine double salts—insecticides of the future—described in patents and publications. Student of Kastle, Stuglits, and Nef.
Box 84–T–6 Ind. & Eng. Chem., Easton, Pa.

B.A. MAJOR in Chemistry, University of Virginia 1942, seeks position in laboratory or plant. Eager to learn, readily adaptable. References. Available immediately.
Box 92–T–6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER MIT 1939. Wants industrial chemical research or development. Prefer metropolitan New York area. 2-B Draft classification will consider college laboratory work with opportunity for further study. Salary unimportant.
Box 98–T–6, Ind. & Eng. Chem., Easton, Pa.

Synthetic Industrial Gloves

A NEW synthetic "7" rubberized fabric glove is announced by the Edmont Manufacturing Co., 552 Orange St., Coshocton, Ohio. These gloves, through actual work tests, have proved two to four times longer wearing than latex-coated gloves and more flexible than natural rubber and other synthetics. They are said to be highly resistant to oils, greases, solvents, acids, caustics, corrosives, and severe abrasives.

Flexible Coating

A COATING designed to meet insulation requirements of metals, wood, fabric, and compositions is known as Resiflex. This is manufactured by the David C. Brown Co., Detroit, Mich., and is said to be fire-resistant, waterproof, oilproof, resistant to mineral acids, and to have unusual flexibility.

Photoelectric Burglar Alarm

A LONG-RANGE photoelectric burglar alarm control has been developed by Photoswitch, Inc., 21 Chestnut St., Cambridge, Mass. The light source projects a practically invisible light beam for distances of 350 to 700 feet.

THE Wheelco Instrument Co., Chicago, Ill., has appointed the Pasol Engineering Co. as Iowa and Nebraska representative. Fitzgerald, Inc., Wichita, has been assigned the Kansas territory.

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

For Sale
CRESYLIC ACID
William D. Neuberg Company
420 Lexington Ave. New York, N. Y.
Telephone LE 2-3324

FOR SALE at sacrifice: Food testing service laboratory, specializing in cereal products including flour milling and baking equipment, specialized instruments, apparatus, and chemicals, formulas, etc. Middle west. Opportunity for energetic chemical technologist.
Box 14-T-6, Ind. & Eng. Chem., Easton, Pa.

ABBE TYPE Refractometer Bausch and Lomb, complete, see E. H. Sargent No. 72035, as new. Used only twice, reasonable discount, immediate delivery.
Box 32-T-6, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Luminous pigments for Blackout and display, Ultra Violet lamp $18.00, Germanium, Gallium, Indium, Potassium, Tantalum, Thorium, Uranium, Zirconium metals and salts of same, also carbides of Tantalum, Titanium, Tungsten, Zirconium.
Box 60-T-6, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Subject to prior sale. Available immediate delivery. B & L Polarising microscope, Spencer Microphotographic Camera, Gaertner Spectrometer, B & L Camera Lucida, Dark Field Condensers, Vertical Illuminators, Comparison Microscope, Triple Objective Microscopes, Reichert Binocular Microscope, Zeiss Abbe Refractometer, Schmidt & Haensch Polarimeter, L & N Lummer, Brodhun Photometer, Dubosq Colorimeters, Filar Micrometer, Stage Micrometers. Spencer two objective Microscopes, etc. Write for any instruments not listed immediately. Quotations. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Drying Ovens, new. Single wall standard laboratory gravity convection type ovens i.d. 12 × 12 × 10 with Thermostatic control accurate to 1 degree, temperature range to 140 c. Constructed with asbestos walls. Cast door and frame, sturdy, built. Available for immediate delivery. Write for immediate quotations. The Laboratory Exchange, 24 E. 21st Street, N. Y. C.

FOR SALE: Available for immediate delivery. International Centrifuges, Freas Drying Ovens, Incubators, Barnstead Water Stills, Hanovia Quartz Lamps, Vacuum Ovens, Horizontal Autoclaves, Bramhall & Deane and others, Analytical balances, Torsion Scales, Pulp and General Laboratory balances, De Laval Separators, Muffle Furnaces, Multiple Unit combustion furnace, Suter Tensile Strength testing machine, Jumbo Mullen Tester hand model, Three Heat Electric Hot Plates New, Large Mortars and Pestles 12" Unglazed, Porcelain, Ball Mills, Ross Disintegrating Mills 18" Cage, Watson-Stillma Hydraulic Press, Potentiometers, Pyrometers, Sayboldt Universal Viscosimeter, Rotary and Sliding Microtomes, Etc. Subject to prior sale. Write us for all laboratory equipment. We are constantly buying and are able to furnish additional offerings daily. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Balances, Pulp enclosed types, specially priced at $27.50 while they last. We made a very timely purchase of these fine general laboratory balances. Fine Mahogany polished case with sliding front door, drawer, leveling screws, Pillar and Beam are laquered brass. Capacity 150 gr. sensitivity 1mg. All new (never used). Order as many as you wish, but hurry as they are moving very rapidly at the very low price of $27.50. No priority is required. These are all packed and ready for shipment immediately. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Hot plates. Three heat electric hot plates heavy duty type, enclosed element, steel polished top 7" at $8.75 complete with three heat switch. Heater cord, 110 volts. 550 watts. Also available in 8 inch size 750 watts. 110 volts. at $10.75. Ready packed for immediate shipment. Quantity very limited. Order promptly. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Hydraulic presses. New Labtest hydraulic presses 6 × 6 platens, Self contained hydraulic pump, Gauge, adjustable between Plattens, with or without electric hot plates, 10 ton capacity, heavy cast steel construction, precision craftsmanship. Specially priced for immediate delivery. Write for literature. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

WANTED: Volumes 28-37 incl. (1924-33) of Journal of Physical Chemistry. Please state condition and price and whether bound or unbound.
Box 18-T-6, Ind. & Eng. Chem., Easton, Pa.

WANTED: "Farbenchemie" by Fiers David & Blangey, 4th edition 1938; "Dyeing with coaltar dyestuffs" by Whittaker & Wilcock, 3rd edition 1938; "The synthetic dyestuffs & intermediate products" by Thorpe & Cain, 7th edition.
Box 20-T-6, Ind. & Eng. Chem., Easton, Pa.

WANTED: LARGE tonnage residues or other raw materials from which values can be recovered in our completely equipped plant. Give analysis containing Caesium, Scandium or Rhenium.
Box 59-T-6, Ind. & Eng. Chem., Easton, Pa.

WANTED TO BUY: Attention: We have immediate need for practically every type apparatus used in a laboratory. We are buying almost all equipment offered us. Sell us your surplus equipment you no longer need. We are paying the maximum market price. Take inventory now and offer us the equipment that you do not use. One or a thousand complete laboratories or plants which may include other equipment. Most critically needed to fill orders to firms now doing war work, Polariscopes, Microscopes, Wide Field Stereo Microscopes, Binocular type Microscopes, Photomicrographic equipment, cameras, Abbe Refractometers, Metallurgical testing equipment, Balances, Lenses, cameras, platinumware and hundreds of others too numerous to mention. We are interested in sincere offerings only do not write unless you are ready to sell immediately. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

WANTED: CHEMICAL Abstracts: Vol. I (1907) Nos. 12, 16, paying $5.-each; Nos. 2, 5, 8, 9, 13, 14, 15, Index number, paying $3.-each; Vol. 2 (1908) Nos. 1, 2, 4, 15, 17, 18, 19, paying $2.50 each; Vol. 3 (1909) Index number only, paying $4.-American Electrochemical Society, Transactions: Vols. 1-80 complete or parts.
Dr. G. H. Fransius, 201 East 82nd Street, New York, N. Y.

WANTED—ALL pieces of equipment necessary for organic research laboratory in pharmaceuticals. If you wish to sell all or part of organic laboratory not in operation write to C. M. Bundy Co., 819-821 High St., Indianapolis, Indiana.

WANTED—COMPLETE set of Chemical Abstracts covering period from 1925 to present—bound or unbound. Would consider 1930 to present if period 1925 to 1930 unavailable.
Box 97-T-6, Ind. & Eng. Chem., Easton, Pa.

WANTED—ONE used Beckman Portable PH Meter, Industrial Model or equivalent. Advise price, condition, availability, etc.
Box 100-T-6, Ind. & Eng. Chem., Easton, Pa.

Offered for Prompt and Continuous Monthly Shipments: U. S. P. CRUDE

MAGNESITE

Substantial quantities, mined in Venezuela, delivered to buyer's port.

Ask details from:

HARDING IMPEX COMPANY, INC.
ONE HUDSON ST., NEW YORK, N. Y.

WANTED AT ONCE!
Chemical Engineer Graduates

—with Refresher Explosive Course experience if possible, for position in plant with Ordnance Department contract. Good salary, travel expenses paid. Must be able to prove U. S. citizenship. Write today—give age, education, training, experience, date available and supply portrait.

War Service of Chemists and Chemical Engineers

Procedure for Deferment

THE intent of the law regarding the selective service of technically trained men has been made plain in many official circulars put out by the National Headquarters of the Selective Service System. Selective Service Memoranda (I-62) and (I-347), the former reprinted in CHEMICAL AND ENGINEERING NEWS, page 520, May 10, 1941, and the latter on page 110, January 25, 1942, point out definitely that there is a critical scarcity of chemists and chemical engineers, as well as of certain other technically trained men. This has been strongly re-emphasized in Occupational Bulletin (No. 10) reprinted in full below. It is the result of very careful study by Selective Service Headquarters and is now officially released over General Hershey's signature. This bulletin should be brought to the attention of local boards. If its recommendations are followed by the local boards, the large number of appeals now necessary to secure proper allocation will be avoided, and the heavy burden of correspondence on the Secretary's office will be lessened.

It is believed that these documents, copies of which will be sent on written or telegraphed demand to the A. C. S. Secretary's office, should impress local boards with the importance of the situation and direct their attention to the advice of Selective Service. Local boards receive so many documents that some are likely to be misfiled and forgotten. Many mistakes have been made, but I have yet to find a local board that does not wish to do its full duty; therefore, necessary information about the situation and the recommendations of Selective Service should be clearly outlined to each board.

In addition to Occupational Bulletin (No. 10) the attention of the local board should be drawn to directives which have been issued outlining the duties of local boards as to reopening questions of deferment where information was lacking. These are given in Amendment No. 60 to Selective Service Regulations, Volume III, Section XXX, Paragraphs 385 and 386, reprinted below.

If appeal must be taken—it should be taken in the case of any properly qualified chemist or chemical engineer necessary to the war effort—the method for doing so is outlined in Memorandum to All State Directors (I-398), Local Board Release (108), also reprinted below.

It is anticipated that a new memorandum applying specifically to the deferment of teachers in our colleges and universities, particularly those teaching technical subjects, shortly will.

CHARLES L. PARSONS, *Secretary*

Occupational Bulletin (No. 10)—Scientific and Specialized Personnel[1]

Part I

1. There are certain persons trained, qualified, or skilled in scientific and specialized fields who, if engaged in the practice of their respective professions, are in a position to perform a vital service in activities necessary to war production and in activities essential to the support of the war effort.

Part II

1. The National Roster of Scientific and Specialized Personnel has certified to the Director of Selective Service that in activities necessary to war production and in activities essential to the support of the war effort, there are certain "critical occupations" which for the proper discharge of the duties involved require a high degree of training, qualification, or skill in scientific and specialized fields. The critical occupations in these scientific and specialized fields, as certified to the Director of Selective Service, are listed on page 4 attached to this bulletin.

2. All of these critical occupations, as listed, require highly specialized periods of training of two years or more. The critical occupations listed on page 4 exist within the provisions of Part V, Memorandum to All State Directors (I-405).

Part III

1. The National Roster of Scientific and Specialized Personnel has certified to the Director of Selective Service that there are serious shortages of persons trained, qualified, or skilled to engage in these critical occupations in activities necessary to war production and in activities essential to the support of the war effort. These shortages exist within the provisions of Part VII, Memorandum to All State Directors (I-405), and accordingly careful consideration for occupational classification should be given to all persons trained, qualified, or skilled in these critical occupations and who are engaged in

[1] Effective June 18, 1942. Distributed to state directors, board of appeal members, local board members, and government appeal agents.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training. Future developments will be brought to the attention of our readers.

activities necessary to war production or essential to the support of the war effort.

Part IV

1. There are many registrants who are in training and preparation to acquire the qualification or skill to engage in these critical occupations. Normally the period of training and preparation to acquire the necessary qualification or skill in these scientific and specialized fields extends over a period of four academic years in a recognized academic, professional, or technical college or university. In many instances, however, it is necessary for persons to have additional study in a recognized academic, professional, or technical college or university in order to acquire the more highly specialized qualification or skill necessary for the performance of particular services in activities necessary to war production or essential to the support of the war effort. Persons engaging in further studies in addition to the four academic years normally required are referred to as graduate or postgraduate students.

2. A registrant who is in training and preparation for one of these scientific and specialized fields may not be considered for occupational classification until the close, or approximately the close, of his second or sophomore year in a recognized college or university.

3 A registrant who is in training and preparation for one of these scientific and specialized fields may be considered for occupational deferment at the close, or approximately at the close, of his second or sophomore year in a recognized college or university if he is pursuing a course of study upon the successful completion of which he will have acquired the necessary training, qualification, or skill, and if he gives promise of continuing and will be acceptable for continuing such course of study and will undertake actual further classroom work within a period of not to exceed four months from the close of his second year.

4. A registrant who is in training and preparation for one of these scientific and specialized fields shall be considered for occupational classification during his third and fourth years in a recognized college or university, provided that he gives promise of the successful completion of such course of study and the acquiring of the necessary degree of training, qualification, or skill.

5. A graduate or postgraduate student who is undertaking further studies for these scientific and specialized fields, following the completion of the normal four academic years, may be considered for occupational classification if, in addition to pursuing the additional studies, he is also acting as "graduate assistant" in a recognized college or university or is engaged in scientific research related to the war effort and which is supervised by a recognized federal agency. A graduate assistant is a student in postgraduate studies who, in addition, is engaged in the teaching and instruction of undergraduate students in these scientific and specialized fields.

6. When a registrant has completed his training and preparation in a recognized college or university and has acquired a high degree of training, qualification, or skill in one of these scientific and specialized fields, such registrant should then be given the opportunity to become engaged in the practice of his profession in an activity necessary to war production or essential to the support of the war effort. In many instances following graduation from a recognized college or university, a certain period of time will be required in the placing of trained, qualified, or skilled personnel in an essential activity. When a registrant has been deferred as a necessary man in order to complete his training and preparation, it is only logical that his deferment should continue until he has an opportunity to use his scientific and specialized training to the best interest of the Nation. Accordingly, following graduation from a recognized college or university in any of these scientific and specialized fields, a registrant should be considered for further occupational classification for a period of not to exceed 60 days in order that he may have an opportunity to engage in a critical occupation in an activity necessary to war production or essential to the support of the war effort, provided that during such period the registrant is making an honest and diligent effort to become so engaged.

LEWIS B. HERSHEY, *Director*

Critical Occupations

Accountants
Chemists
Economists
Engineers:
- Aeronautical engineers
- Automotive engineers
- Chemical engineers
- Civil engineers
- Electrical engineers
- Heating, ventilating, refrigerating, and air-conditioning engineers
- Marine engineers
- Mechanical engineers
- Mining and metallurgical engineers, including mineral technologists
- Radio engineers
- Safety engineers
- Transportation engineers—air, highway, railroad, water

Geophysicists
Industrial managers
Mathematicians
Meteorologists
Naval architects
Personnel administrators
Physicists, including astronomers
Psychologists
Statisticians

Amendments to Regulations[1]

Amendment No. 60, effective June 5, 1941, amends Volume III, Section XXX to read:

Section XXX—Reopening Classification

385. CLASSIFICATION NOT PERMANENT.

a. No classification is permanent. At any time prior to induction the case of a registrant may be reopened and his classification considered anew in the manner provided in this section.

b. Each classified registrant shall, within *10* days after it occurs, and any other person should, within *10* days after knowledge thereof, report to the local board in writing any fact that might result in such registrant being placed in a different classification.

c. The local board shall keep informed of the status of classified registrants. Registrants may be questioned or physically or mentally re-examined; employers may be required to furnish information; police officials or other agencies may be requested to make investigations; and other steps may be taken by the local board to keep currently informed concerning the status of classified registrants.

386. HOW CASE REOPENED.

a. The local board may reopen the case of a registrant on its own motion; except that, without evidence of change in registrant's status or of other new pertinent facts not contained in the record considered on appeal, no case shall be reopened in which the existing classification was determined on appeal.

b. A registrant, any person who claims to be a dependent of a registrant, or any interested party in a case involving occupational deferment, may file a request to

A.

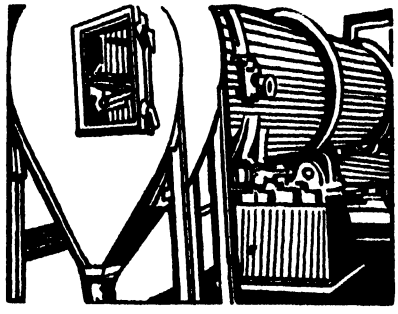
reopen a case. The request must contain or be accompanied by written statements showing a change in the registrant's status or other new pertinent facts not considered in determining his existing classification.

* * * * *

Notice to Employer of Right to Appeal, DSS Form 59 (III)[1]

National Headquarters has continually called attention to the necessity that local boards give full consideration to requests for the occupational deferment of men claimed to be necessary in war production, agriculture, or other essential civilian activities.



It should be observed that occupational deferments are made in the national interest and not for the convenience of the registrant.

There have been and are now a large number of cases in which the right to appeal on occupational grounds has been overlooked. To expedite final determination of occupational deferment cases and to eliminate the possibility of erroneous classification in such cases, through failure to take advantage of procedural rights, a new procedure has been established. It is directed that when a local board denies a request for Class II-A or Class II-B deferment in a case where there is on file Affidavit to Support Claim for Occupational Deferment, DSS Form 42A, the local board shall no longer send to any person who has signed Form 42A a Notice of Classification, DSS Form 57, but shall send a Notice to Employer of Right to Appeal, DSS Form 59.

Local boards are further directed to give particular attention to cases where neither Form 42 nor 42A has been filed but in which the Selective Service Questionnaire, DSS Form 40, indicates that occupational deferment should be considered. Efforts should be made by the local board to contact those persons who would be likely to provide additional information or affidavits which will assist the local board in determining the proper classification of the registrant.

LEWIS B. HERSHEY, *Director*

[1] Memorandum to All State Directors (I-398); Local Board Release (108); effective March 9, 1942.

American Chemical Society

Progress Report No. 6 of the Committee on the Professional Training of Chemists

THE most recent meeting of the committee, April 16 to 20, 1942, was immediately previous to and during the Memphis meeting of the AMERICAN CHEMICAL SOCIETY.

Students who receive the bachelor's degree from institutions in the appended list after fulfilling the minimum requirements adopted by the AMERICAN CHEMICAL SOCIETY for the professional training of chemists become eligible for full membership in the AMERICAN CHEMICAL SOCIETY following graduation and two years' experience in the field of chemistry or chemical engineering or in postgraduate study. Students who graduate in chemistry or chemical engineering from other colleges will be eligible only after five years. In each institution listed, the head of the Department of Chemistry will be asked after each graduation period to give the Committee on the Professional Training of Chemists the names of those students who have fulfilled the specified requirements and who will thus, in the minimum time, qualify professionally for full membership in the AMERICAN CHEMICAL SOCIETY. Students majoring in chemistry or chemical engineering and graduates without the experience requisite for full membership may join the SOCIETY as junior members with all privileges of membership except that of holding office. They thus gain seniority in the SOCIETY and are automatically transferred to full professional status on acquiring the necessary experience.

Only a small number out of several hundred institutions have yet to be given formal consideration. For several others action has been deferred, either because the committee wishes to obtain further information or because of pending changes which may alter situations within certain institutions.

It should be emphasized that the institutions on the list will be reviewed from time to time and their fitness to retain recognition examined. Any institution for which an unfavorable action has been given may, after an interval of two years following the date of notification of such action, request a review of its situation by the committee. The committee may drop an institution from the approved list (1) if it does not graduate each year at least one student who meets the requirements for attaining membership in the SOCIETY in the minimum time; (2) if changes in department's curriculum or institution's general educational policy tend to be contrary to the best interests of fundamental chemical training; (3) if the attitude and spirit of the department do not show or manifest a definite professional point of view toward student training; (4) if departmental facilities are not kept up and maintained to an adequate standard; or (5) if quality of staff is not maintained when changes occur.

The committee recognizes that one of the most important factors in assessing the quality of work in an institution is concerned with the personnel of the staff. It is felt that the staff should be adequately trained and properly qualified to teach chemistry with its latest developments. Institutions which meet merely formal requirements without at the same time having the proper personnel can scarcely be considered to do high quality work.

The committee realizes that many institutions have a very high type of instruction in the elementary chemistry courses but, either through lack of funds or insufficient size of staff, are unable to give the necessary advanced work of the bachelor's degree level or are unable to give it adequately for the professional training of chemists. The committee feels strongly that this type of institution serves a very useful purpose in the American scheme of education but that it would be unwise for such institutions to attempt professional training in the sense that the committee uses that phrase. Graduate schools and employers of chemists will continue to recognize that high quality men soundly trained in the elementary principles of chemistry may be obtained from these institutions, and it should be understood that no stigma is attached to their omission from the list of institutions the committee deems to be qualified to offer professional training for chemists.

The Council Policy Committee recommended the following motion to the Council at the Detroit meeting, September 1940, and it was unanimously passed:

Moved, that the AMERICAN CHEMICAL SOCIETY accredit for chemical engineering instruction those institutions as and when accredited by the American Institute of Chemical Engineers.

In accordance with this action, the list of institutions whose chemical engineering curricula are approved by the American Institute of Chemical Engineers as of October 30, 1941, follows:

Brooklyn Polytechnic Institute (day and eight-year evening), Brooklyn, N. Y.
California Institute of Technology (five-year course), Pasadena, Calif.
Carnegie Institute of Technology, Pittsburgh, Penna.
Case School of Applied Science, Cleveland, Ohio.
Clarkson College of Technology, Potsdam, N. Y.
Columbia University, New York, N. Y.
Cooper Union (day school), New York, N. Y.
Cornell University, Ithaca, N. Y.
Drexel Institute, Philadelphia, Penna.
Georgia School of Technology (including co-operative curriculum), Atlanta, Ga.
Illinois Institute of Technology (Armour College of Engineering), Chicago, Ill.
Iowa State College, Ames, Iowa.
Johns Hopkins University, Baltimore, Md.
Lehigh University, Bethlehem, Penna.
Louisiana State University, University, La.
Massachusetts Institute of Technology, Cambridge, Mass.

Western Reserve Reorganizes Chemistry Department

WESTERN Reserve University announces a new organization of the Department of Chemistry. The new plan is intended to distribute the duties of administration so as to interfere as little as possible with the researches of the men in charge of the department.

Harold Simmons Booth, professor of chemistry, has been appointed chairman of the department. Frank Hovorka, formerly associate professor, has been promoted to a professorship and made director of university chemistry laboratories. Herman Peter Lankelma, formerly associate professor, becomes professor of chemistry and secretary of the department, and Robert E. Burk, professor of chemistry, has been assigned to the responsibility of special departmental projects. Oliver Grummitt, instructor in chemistry, has been promoted to assistant professor. Two new members appointed to the staff are William Kieffer, who received his Ph.D. degree from Brown University, and has been for the last two years instructor in chemistry at Wooster College, and Terrell Hill from the University of California.

SKINNER & SHERMAN, INC.

Buffalo Makes the Tools for the Chemist

EMIL RAYMOND RIEGEL

Edmund Hayes Hall, University of Buffalo, Buffalo, N. Y.

MANY events and many objects have spread the name of Buffalo to all parts of the land; to the world as a whole, Buffalo means the home town of Grover Cleveland, the place where William McKinley was killed. Before those days, it meant the place (one might say village and be quite truthful) where the Erie Canal took its water from the Great Lakes in order to carry it to the Hudson and thence to the sea. Buffalo, to still other people, means the birthplace of Katherine Cornell.

To the chemist and his twin the chemical engineer, "Buffalo" means fans, pumps, blowers, made by the Buffalo Forge Co. and its subsidiaries; "Buflovak" means vacuum equipment made by the Buffalo Foundry and Machine Co., heat exchangers, and many other forms of equipment for his manufacturing plants. Other names distinct from that of the city have also carried its fame to faraway points in the form of labels and plates on equipment for the factory—"Zaremba" for evaporators, "Dopp" for kettle, "Niagara" for blowers, again "Niagara" for water meters, "Consolidated" for packing machinery, "Ross" for heaters, meaning exchangers, "Spencer" for optical instruments of all kinds and of high grade, "Globe" or "Hewitt" for belting, "Richmond" for sifters, the clever "Wilson" feeders, dust collectors, porcelain insulators—and these do not make a complete list. All have contributed to make Buffalo a synonym for chemical equipment.

The Buffalo Foundry and Machine Co. was a logical development of the city's primary industry, that of making iron and steel, and that, in turn, was due from the earliest days to its strength as a transportation center. Water transport, and soon after, rail transport, made possible the rapid growth of its iron furnaces. Foundries are numerous in the area. Many of them, such as J. H. Williams, and Vulcan, stand high in the mechanical world with their cut gears and other machined products.

The Buffalo Foundry Co. was started in 1902, and moved to its present location on February 3, 1903. The founder was Henry T. Miles, who is still the president and leader. Associated with him in the earliest period were Mr. Dunbar and Mr. Sullivan. The basic business was and still is foundry and machine-shop jobbing, but from its beginning the company built dryers, soon caustic pots and other pieces which were larger and larger, so that by 1911 a new machine shop had to be built, and again expanded in 1930. To indicate the large-sized equipment which is handled, it may be stated, for example, that the present shop has a 25-foot boring mill, and a 90-foot milling machine.

In order to build a large boring or milling machine, a large casting is necessary, and it is the pouring of these pieces, weighing as much as 115 tons, which has become one of the specialties of the firm. Recently there have been produced for a war plant the castings necessary for a 90-foot lathe.

During the war of 1914–18, the Buffalo Foundry and Machine Co. really got into chemical engineering. War equipment for nitrations, sulfonations, distillation of organic substances useful in the making of explosives, aniline stills, and many other articles were required. At the present time the plant is again doing much war work along its own specialty lines. The plant is under the supervision of police, and a visitor must obtain a pass and exchange it for a large badge with the police officer in charge before he can enter the foundry and shops.

Mr. Miles continues as the active head, but has transferred some of his duties to Charles W. Pearson, executive vice president. Known to many chemical engineers and chemists in New York City as well as in Buffalo is the vice president in charge of all engineering work, Guy Harcourt. Other men with many friends in the profession are Martin Kermer, chief engineer in charge of evaporators, Dirk J. Van Marle, chief chemical engineer in charge of dryer production, and Lambert J. Wischerath, advertising manager. The Buffalo Foundry has another distinction in its extensive and excellent research laboratory which houses, among other apparatus, a fractionating still on which any quantity of interest to chemical engineers can be measured. The laboratory is in charge of Mr. Lavett.

The several lines of business to which this firm's work means strong support are:

Drying and evaporation of foods, including baby foods, for which stainless steel evaporators, mainly double effect, are used.

The dairy industry for which, not so long ago, a two-stage drum dryer was adapted for the drying of whey. This difficult operation is performed in two separate stages, and succeeds so well that a dry, nonhygroscopic product results. The evaporators deliver 40 per cent liquor to the upper drum which drops a 70 per cent liquor to the lower drum where the liquor is seeded, and the crystals dried.

Electrolytic caustic evaporators.

Kettles of all kinds for chemical companies.

Atmospheric dryers and vacuum dryers, one of the latter for drying tannic acid recently. The latest development is a double drum vacuum dryer.

All this is in addition to the general foundry and machine-shop jobbing business mentioned before. Little wonder that the original 6 acres had to be augmented to the present 18. The plant is on the New York Central Belt Line, and has a siding run into its machine shop and into the foundry.

The Buffalo Foundry and Machine Co. sent a large exhibit to the Chemical Show of 1917 at the Grand Central Palace in New York, which caused many favorable comments. It has been an exhibitor ever since.

The Buffalo Forge Co. had its start in 1878, when William F. Wendt, an enterprising young bookkeeper, bought a half interest in a patent for the first portable forge with attached blower. Two mechanics who owned this patent had been carrying on a small, struggling business which Mr. Wendt, by hard work, began to develop. In 1880 the business was sufficient to warrant purchase of a small shop for manufacturing and orders began to come from widespread territory. In 1883 Mr. Wendt became the sole owner and began to add more products to the line until 1888, when the company entered the heating and ventilating field. At that time there was a complete line of blacksmith's forges and blowers, blacksmith's drills, punches, and shears. William's brother, Henry W. Wendt, was made a member of the firm, and business was continued as a partnership until 1900, when it was incorporated and a plant of considerable size was built at the present location.

Export business began to grow, branch offices were established, and soon after a Canadian plant was built. In 1903 the Geo. L. Squier Manufacturing Co., manufacturers of sugar, rice, and coffee machinery, and The Buffalo Steam Pump Co., now Buffalo Pumps, Inc., manufacturers of steam and centrifugal pumps, were acquired.

The growth and development of the company were the result of careful studies of markets and improvement in quality. It was natural to progress from forge blowers to blowers for other industrial applications and ventilating fans for public buildings and air-conditioning purposes; in fact, although the name "air conditioning" did not have public acceptance until nearly 20 years later, all the essentials of air conditioning for comfort were being produced and marketed by this company

beginning with about 1902. Willis H. Carrier, at that time chief engineer of the company, designed the first successful air washer, patented and applied the principles of dewpoint control, and made many industrial installations for winter and summer air conditioning, including every essential feature of the most modern system.

It was natural for a large sheet metal plant that numerous power metal-working machines were invented for its own use. A large business later developed from the sale to other companies of many of these power punches, shears, and bending rolls which were first designed for carrying out processes in the Buffalo Forge Co. plant. These lines of machines have been amplified and carried to sizes far beyond the original applications; also complete lines of drilling machines, single and multiple spindle, have been added.

Anticipating the rapid increase in the variety of applications for blowers and fans in industry, the company early adopted a policy of training young engineers, establishing branch offices, and staffing them entirely with men qualified to assist and guide all types of users in the selection and application of this equipment, thus placing the emphasis on engineering rather than selling. Continued up to the present time, this policy has been quite distinctive.

When in 1916 William F. Wendt retired, his interest was purchased by Henry W. Wendt, and the company was reorganized, some of the employees becoming stockholders, with the stock remaining comparatively closely held. In September 1941 there was a reorganization of the Buffalo Forge Co. and subsidiaries. Buffalo Pumps, Inc., and The Canadian Blower & Forge Co., Ltd., are now wholly owned by the Buffalo Forge Co.

In 1914 the company published the first edition of the handbook "Fan Engineering", which has been occasionally revised and republished and is now in the fourth edition. It was intended to supply information to engineers on the properties of air and air flow as well as on the requirements in the way of equipment for many of the typical applications. This book has long been regarded as the bible for all users of air-moving machinery. Being sold at cost, it has gone to every country in the world, making a total of many thousands of copies.

Chemical engineers in every part of the world are familiar with Buffalo ventilating and exhaust fans. The Buffalo Forge Co. pioneered in the development of rubber covering for exhaust fans handling corrosive fumes and thousands of these fans are in service in the industry. Much special equipment for the chemical industry is also manufactured at 490 Broadway.

If there has been an outstanding reason for the success of the company, it is the willingness to discard old ideas for new and better ones, and the constant emphasis on research and development.

There are about 1,500 employees in the three plants, most of whom are engaged at present in the manufacture of some type of process equipment.

To many chemists "Zaremba" is a synonym for "evaporator". This well-known firm was founded in 1909 by Edward Zaremba, a graduate in chemical engineering of Wisconsin, and Arthur Mantius, who came from Heidelberg. The evaporators built by the young firm were the first to have horizontal tubes. Later the multipass evaporator intended especially for salt-caustic work was developed. Still another special design is one which has its heating element on the outside, so that no boiling takes place in the tubes. For the caustic work, the tubes are generally nickel and the shells nickel clad; as a consequence, no incrustation forms. Zaremba evaporators are sent all over the world. The president of the firm is B. S. Hughes, who has the distinction, among others, that he was the purchaser of the first evaporator designed by Zaremba and Mantius. Among its technical experts, a figure well known to the chemical workers is that of W. H. Eggerts.

The Ross Heater and Manufacturing Co. of Buffalo provides "Ross Equipment and Engineering Service" to the industries; the chemical engineers and chemists know best the Ross heat exchangers, one of the main products of the company. A trip through the plant provides a vision of exchangers of all types, sizes, and even colors. An exchanger so small that it can be held in the hand, made of copper and brass, may be grasped over here, while over there stands a 3-foot shell many feet long, of cast iron, which the crane only can lift; or, again, an all-welded steel surface condenser several times as high as a man.

The company was started in 1915 by S. C. Ross as an independent enterprise; in 1933 it became part of the American Radiator Co. The present general manager is C. H. Currier; of the personnel, the man with most acquaintances among the chemists is T. Tinker, chief engineer. The company makes heat exchangers, steam-jet ejectors, and surface condensers of various material—steel, stainless steel, nickel, copper, Muntz metal, brass, bronze, and admiralty metal. The products are sold nationally and internationally. Ross equipment will be found in the Dutch East Indies, Rumania, Aruba, and every other part of the world. The company employs 280 men; the present plant is in process of being enlarged.

To the west of Buffalo, in Silver Creek, the firm of S. Howes Co. manufactures a line of machinery consisting of many items; among them those of greatest interest to the chemical industries are a cyclone dust collector, in single or twin type, and the "Invincible" tubular dust collector. The latter has a series of radially arranged textile tubes set in rows on a central drum. The fan-driven dust-laden air enters in the center of the drum and passes to the inside of the radial bags; the dust is retained in the bags, the clean air passes through. At each full revolution, a rubber-faced hammer strikes the spring-cushioned wooden buffer to which the outer end of each row is attached, and the dust drops to the central drum onto a small conveyor. The Eureka dust collector is especially well represented in flour mills, where it is frequently found supported from the ceiling. Eureka machinery has been made in Silver Creek since 1856.

Almost on the edge of the city also to the west, lies Blasdell, where the Exolon Co. has for many years manufactured abrasives and, especially, with regard to tools for the chemist, electromagnetic separators second to none. The newest type is a multiroll separator with high capacity, and containing special features of design found in no other similar device. The Exolon Co. manufactures also shaking tables for the dry separation of material by specific gravity, and other equipment. In the near future the plant is to be moved to North Tonawanda. Well known to the chemical trade is Mr. Ramsey, chief engineer.

In Lackawanna, just over the city line to the east, is situated the plant of the Electro Refractories & Alloys Corp., founded in 1919 by Luke Milward, who is still the president, John Edmonds, and William Farrish. One of the well-known products of this firm is the silicocarbide crucible for melting metals, made in a number of sizes, the largest holding 1,000 pounds of aluminum. Other products are bricks and shapes of certain refractories—namely, silicocarbide, crystallized alumina, magnesia, and mullite. The mullite is made in the plant by the fusion of Indian kyanite in an electric furnace. Furthermore, grinding wheels of silicocarbide, and alumina, vitrified and resinoid-bonded, are made here. The company manufactures also nonferrous alloys, among others cupro-nickel. The present executive vice president is Grant Diamond.

In nearby Lockport the Richmond Co. manufactures another well-known tool, the Richmond flour sifter.

The Lapp Insulator Co. is located in LeRoy. A line of chemical porcelain and acid- and heat-resisting equipment of special merit in various respects is made by this firm.

Buffalo is the home of Walker-Wallace, Inc., the makers of the A. P. V. (Aluminum Plant and Vessel) plate heat exchangers and the Paraflow coolers. The A. P. V. plate heat exchanger consists of cast pedestals to which are attached sliding bars, which carry the plates and the cast movable head. The plates are made of polished die-pressed stainless steel, or other

suitable metal, and have grooves on both sides. The resulting assembly has the highest possible efficiency and lowest possible radiation losses. The Paraflow cooler—for instance, the wort cooler—has grooved plates separated by flat dividing sheets. The flat plate has the effect of transforming the grooves into pipes having a series of 180 degree reversals in directions, ensuring high turbulence and, therefore, high rate of heat exchange.

Another interesting Buffalo tool for the chemist is the filter manufactured by the firm of Jacob House and Sons, especially designed for filtering sirups. All of white metal or nickeled, it has an attractive appearance and enjoys high vogue.

The Wilson Chemical Feeder Co. manufactures an almost unique device which permits the proportioning of solutions or liquids in medium, small, and extremely small amounts with a high degree of precision. These devices are chemical feeders which are driven for the most part by either motors or water meters and are rapidly becoming indispensable for proportioning liquids in the chemical, food, and allied industries. So delicate are the machines that they will chlorinate water exactly, for example, with one-tenth part of chlorine to one million parts of water. The incentive for developing these machines was the need of sterilizing drinking water on the Great Lakes freighters, as well as on boats on the Ohio and Mississippi Rivers. The chemical feature is a pulsafeeder and feeds generally small but always precise volumes of liquid by the compression of a rubber tube. At this time the company is about to move to larger quarters on Clinton Street.

The Niagara Blower Co., situated within the city limits, manufactures a line of well-known fans and blowers, distributed nationally. John Smith is one of the active and prominent engineers in this firm.

One of the important units of the Worthington Pump Co. is its plant in South Buffalo at Clinton and Roberts Streets. Originally the Snow Steam Pump Works, it became part of the Worthington interests many years ago. The Buffalo plant makes compressors of the reciprocating type. It manufactures Diesel engines, vacuum pumps also of the reciprocating type, and V-drives. The number of men employed is not far from 2,000. The Worthington Plant at Harrison, N. J., which is probably the mother plant, manufactures pumps, surface condensers, feed water heaters, and hot process water softeners.

The last of the "Makers of Tools for the Chemist" and undoubtedly the oldest, is the business established in 1857 at 462 Ellicott St., Buffalo, by H. Wm. Dopp. Mr. Dopp was a machinist and blacksmith. In those early days, soap was stirred with a crotch or crutch and this was referred to as "crotching". While developing a machine for doing this, which he patented, Mr. Dopp also invented and patented a seamless cast iron steam-jacketed kettle for use as part of this "crutcher", and thus the Dopp kettle came into being.

Upon H. Wm. Dopp's death in 1886 the business was taken over by his son, Wm. H. Dopp, who had been brought up in the business and was a chemist. Under his guidance, the firm moved to a rented wooden building at 1300 Niagara St., long since replaced, where it operated a foundry, but after several reverses its assets were taken over from the receiver in 1903 by a group of eight men headed by D. W. Sowers.

In 1910 Mr. Sowers formed the Sowers Manufacturing Co., which bought the H. W. Dopp Co., the corporate existence of which is maintained for the purpose of retaining the trade mark and name of Dopp.

In 1914, with the United States cut off from Europe as a source of supply of chemicals and equipment due to the first World War, the company's products became increasingly valuable for chemical plant use, and upon our country's entry into that war the Sowers Manufacturing Co. was called upon to produce quantities of equipment for mixing Amatol for loading shells.

With the return of peace, the company more actively turned to the manufacture of equipment for the chemical and other processing industries. It was during this time that the advantages of Dopp positive-scraping were recognized. Positive-scraping was made possible because, owing to the special process and equipment which had been developed for the kettle's manufacture, it had a perfectly true and smooth surface. Positive-scraping brought improved heat transfer, improved quality of product, etc. Today Dopp seamless kettles, mixers, vacuum and pressure pans, etc., are used in more than 90 different industries, important among which are the manufacture of chemicals, soaps, sulfonated oils, lubricating greases, glues and pastes, resins and plastics, waxes, etc.

It is possible that several additional "Makers of Tools for the Chemists" in the Buffalo area have not been included but if so the omission is unintentional. All the "Makers" feel very close to the organizations of chemists and chemical engineers and are ambitious to furnish them more and better tools; on the occasion of the coming meeting of the AMERICAN CHEMICAL SOCIETY in Buffalo, September 7 to 11, they extend, through the writer, a hearty welcome to the prospective visitors.

For pictures, see pages 864 and 865.

Seventh Unit Process Symposium

PAPERS for this Symposium on Unit Processes, under the sponsorship of the Division of Industrial and Engineering Chemistry of the A. C. S., should be sent to R. Norris Shreve, Purdue University, West Lafayette, Ind. Two copies of the title and abstract should be sent at once, followed by the full paper. This symposium will be held for one day at the Buffalo meeting of the AMERICAN CHEMICAL SOCIETY, September 7 to 11, 1942.

Travel—Buffalo Meeting

PUBLIC transportation services are burdened by a tremendous increase in traffic and a decrease in facilities available to civilians. It is *essential* that those planning to attend the fall meeting of the AMERICAN CHEMICAL SOCIETY in Buffalo the week of September 7 make reservations early and buy tickets well in advance of departure; otherwise it may be impossible to secure accommodations. Refunds will be made by the railroads for any tickets not used, provided notice of cancellation of Pullman reservations is given before departure of the train.

A large and important meeting is anticipated. You should be there. To assure this, make railroad reservations promptly.

South Dakota State College Chapter of A. C. S. Student Affiliates

Detergents from Petroleum[1]

LAWRENCE FLETT, National Aniline Division, Allied Chemical and Dye Corp., Buffalo, N. Y.

About 1930 a new era in the science of washing agents started with the introduction of the synthetic detergent. For several thousand years, in fact for practically the entire existence of civilization, soap has had a monopoly of the cleaning business. Soap was a very worthy monopolist. We should have been much less happy without it. We have a general word, "detergent", which embraces soap and other cleaning agents, but it found practically no use up to about 1930 because there was no real detergent other than soap. Today we must take out this word detergent, dust it off, and put it to use because the new cleaning agents are not soaps.

We do not now have a good name for these new washing agents. They are generally called "synthetic detergents". That is not a good name because soap is a synthetic detergent. The new agents have been called "soapless soaps", and that name is not correct because they are not soaps. Another name is "detergents" and that name is safe enough, but it includes soaps. Still more recently these new products have been referred to as "surface active agents". Although this term is broad enough to include soap and the wetting agents, it has come to have a more specific meaning. It is being applied to those agents which have an unusual surface active action. The activity of the new detergents comes from their ability to coat over surfaces with layers so thin that they do not visibly change the coated material. The material so coated no longer presents its own surface to a surrounding solution, with the result that its properties in solution are changed.

Soap has become such a common factor in our lives that we do not realize the limited conditions under which it can be used. Soap must be used in warm to hot water. The washing solution must be alkaline. Lime salts and heavy metal salts must not be present in sufficient amounts to precipitate all the soap. Such salts should preferably be absent. The water used must not be too salty. In the industrial world these conditions are not easily arranged. There are many operations preferably carried out in neutral or acid solutions, in the presence of heavy metals, or in cold water. There was real need for a powerful cleaning and dispersing agent which would be effective under any conditions.

The new detergents, which came with this new era, are detergents which would work under any and all conditions. They wash in acid as well as in alkaline solution; they clean cold; and they clean hot. They wash better in hard water than in distilled water. They wash in sea water. These detergents can be used even with the heavy metal salts in electroplating baths.

The man who dyes and finishes cloth must use cleaning agents, and he has been forced to confine his cleaning to operations which are compatible with soap. Soap precipitates in sticky curds with the lime salts and magnesium salts. The precipitated curds have a way of gathering on textile goods; and of course, a fabric spotted with lime soaps will not dye evenly. This trouble is so serious that the dyer has been willing to pay a premium to obtain a detergent which did not precipitate in sticky curds with lime salts. The new synthetic detergents were developed by companies serving the textile industry to solve the problems of the dyer and finisher. The use of these detergents soon spread until today practically every industry uses these new surface active agents and their use is being extended to the household.

Attempts to develop new agents which would not cause the difficulties soap caused, began by coincidence soon after the petroleum business started. It began with the development of the "wetting agent". Before textile goods can be dyed or finished, they must be wet. If they are not wet, they cannot absorb dyes or anything else from a solution.

The first really important wetting agent to substitute soap came into general use about 1875, and was the sulfonated castor oil, sometimes known as Turkey red oil. About 30,000,000 pounds a year are still used. Sulfonated castor oil precipitates to some extent in hard water, but the precipitate remains dispersed and relatively innocuous. Turkey red oil used with soap made the lime soap precipitates less damaging. The present use of Turkey red oil is largely that of an oil to lubricate and soften textile materials. Although sulfonated castor oil had many of the properties of soap and although it lacked some of the undesirable properties of soap, its use as a soap substitute was limited because it was not a cleaning agent. Products like sulfonated castor oil which cause textile materials to wet out but which had no washing power were called "wetting agents".

In the period from 1912 to 1920, during the last war, the propylated and butylated naphthalene sulfonates appeared commercially as soap substitutes in Germany. These agents gave clear solutions in hard water, they were stable in acid solution, and they lacked many of the faults of soap. Since they did not wash, these agents were classified as wetting agents.

The commercial introduction of wetting agents which were also detergents started in the United States about 1930 when the National Aniline Division of the Allied Chemical and Dye Corp. introduced a wetting agent called Gardinol, which was at that time manufactured in Europe. Gardinol was a mixture of sulfates made from alcohols derived from coconut oil. It was a white solid, stable in warm or hot hard water, reasonably stable in neutral solutions, and not too quickly broken down in cold acid solution. The remarkable thing about this new wetting agent was that it could wash and clean. Soap had a challenger. The high price at which Gardinol was introduced did not prevent its ready acceptance by the dyers. Gardinol was the first product of commercial importance in this new era of synthetic detergents.

After the stock market crash of 1929 upset our economic system, this is how things stood:

1. There was the unsolved riddle of how to make a low-cost but good washing agent from petroleum.
2. There were miraculous new washing agents like Gardinol for which there was a demonstrated demand at a high price, and there was an insistant demand from industry for the new detergents at a price more comparable to that of soap.

Here then was a conjunction of two stars to both of which you could hitch your wagon. The problem was no longer how to produce a low-cost soap from petroleum but how to make one of the valuable new synthetic detergents from petroleum at a cost comparable to that of soap. The successful production of the new detergents from petroleum by the National Aniline Division was a project of considerable magnitude. No one should get the idea that it was done in any reasonable period of time by any one man. It was a project requiring the team work of an organization.

From this work emerged the first commercially important detergent from petroleum which had a powerful washing action—a product which was stable in hard water and in neutral or acid solutions and was a powerful dispersing agent under any conditions of use. It was the first of the synthetic detergents which was completely stable to acid and alkaline solutions.

In general, all detergents are made up of two parts. There is a long hydrocarbon chain sometimes called the hydrophobic group. In the detergents made from pe-

[1] Jacob F. Schoellkopf medal address, presented before the Western New York Section of the American Chemical Society, May 19.

troleum the long hydrocarbon chain or hydrophobic group is the part of the molecule derived from petroleum. Then there is the group which makes the product water-soluble, known as the hydrophilic group. Practically all of the commercially important new detergents are sulfuric acid derivatives. They are practically all sodium salts. Sodium sulfate is well known. It is soluble in water and causes water to froth slightly. All are acquainted with the two petroleum distillates known as white oil and kerosene. If you had a chemical product which was half oil and half sodium sulfate, you would have a detergent. That is the type of detergent which we make from petroleum.

The first step in the process which we have devised for manufacturing detergents from petroleum is to make the petroleum distillate chemically reactive. This can be done in one way by reacting it with chlorine. The aliphatic chloride so produced is still difficult to convert to a sulfuric acid derivative, but it is easily converted to an alkyl aryl compound. The resulting aliphatic aromatic compound may be sulfonated to give the sulfonic acid which is generally converted to the sodium salt. Other metal salts may be made. Practically all of the metal salts, as well as the ammonium salt of this type of compound, are sufficiently soluble to give an adequate cleansing or surface active action. The basic process is very simple. Its operation is complicated by many purification operations directed to giving a cleaning agent which will be effective and relatively colorless and odorless.

The importance of cleaning agents from petroleum has increased since Pearl Harbor. Cleansing agents which can be made entirely from domestic ingredients today assume national importance because the importation of vegetable and animal oils has substantially stopped. Foremost in the list of oils which we no longer receive is coconut oil, most of which came from the Philippines. Coconut oil was used in practically all household soaps. Six hundred million pounds of it were imported in 1941, of which almost 500,000,000 pounds found their way to the soap kettle. The loss of coconut oil will not make itself felt at once because there are large stocks, but when these are consumed what shall we use as a substitute? We cannot use tallow since 90 per cent of that goes to soap now. There is no vegetable or animal oil which is now available in amounts far in excess of the wartime needs. Sales of practically all vegetable and animal oils are under limited restrictions. The soap industry is one of three which are large consumers of oils. The other two are having their own difficulties so they have no oil to contribute to soap. The paint industry for one has been handicapped for some time by the loss of china wood oil from China, and from other consumers it is drawing castor oil which is dehydrated to give a drying oil. In the food industry the edible oils and fats are in greater demand than ever because of declining imports.

Whatever our shortages in animal and vegetable oils may be, we do have an abundant supply of petroleum. The United States production of petroleum is not measured by a billion pounds, but by a billion barrels every year. Our ability to make detergents from petroleum makes potentially possible the release of 2,000,000,000 pounds of fats and oils to become foodstuffs. This would increase by more than 30 per cent the amount of oils and fats available for food. The field of synthetic detergents and wetting agents is likewise affected by the loss of coconut oil. Some of the more important synthetic detergents are made from coconut oil, and it is to be hoped that the dwindling supply of coconut oil will be conserved to make those surface active agents which are more valuable than soap.

If the situation arises where synthetic detergents from petroleum must be used, several basic principles which govern their use should be known. To point out certain peculiarities of the synthetic detergents, it is necessary to select one for illustration, in this case Nacconol NR. Nacconol NR is truly representative of the new detergents from petroleum. It is a product which is stable under any conditions of use which we have yet encountered. Nacconol NR is a little less than 40 per cent alkyl aryl sulfonate and about 60 per cent sodium sulfate.

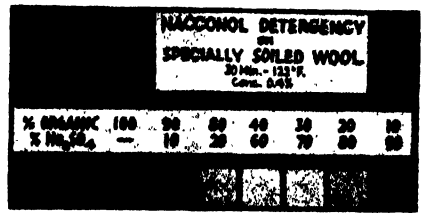

Figure 1

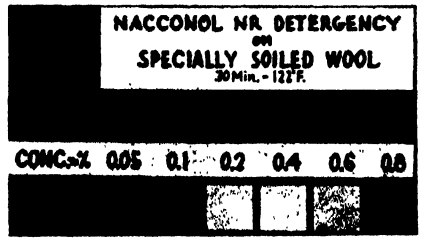

Figure 2

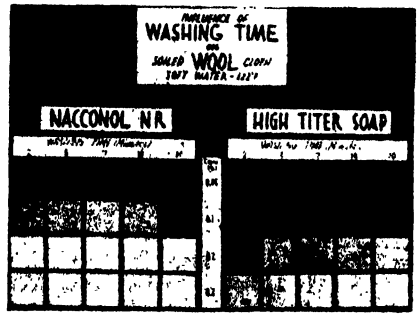

Figure 3

First and foremost in the use of Nacconol NR, the effect of the inorganic salt which it contains should be appreciated.

The alkyl aromatic sulfonates, unlike soap, are salts of strong acids. In very weak solutions they give true solutions in contradistinction to the colloid-like solutions of soap. Sulfonates in very dilute solutions are surprisingly improved in their washing action by the addition of salts, possibly as a result of their conversion by such additions to the colloidal state of solution. The effect of salt is shown in Figure 1 which shows squares taken from pieces of washed wool. The wool is first soiled in a special machine with a mixture of lamp black, fat, and oil. The washings are then made in a Launderometer which gives light scrubbing action. The amount of sulfonate used for washing is reduced, going from left to right, and is replaced by an equal amount of sodium sulfate. The fourth square was washed with only 40 per cent as much sulfonate as the first square where 100 per cent detergent was used and yet it washed whiter. This mixture represents Nacconol NR which is about 40 per cent alkyl aryl sulfonate and 60 per cent salt. In the sixth square was only a fifth as much sulfonate as in the first square and yet the washing obtained was better than the washing obtained with the pure product to which no addition of salt had been made.

Economical use of any of the new detergents from petroleum requires a careful consideration of the correct amount of salt. In the washing represented by this slide, the product could advantageously have had half of the organic matter replaced by salt. However, this is an unusual condition since a relatively strong solution is needed to wash the heavy soil. Ordinarily wool washing is carried on with 1 part per 1,000 or 0.1 per cent.

The next consideration is the amount of detergent required. Commercially detergents are used at concentrations from 0.001 per cent to 20 per cent. There is a damaging misconception that the more detergent used the better cleaning. Figure 2 shows that this is not true. Here is a heavily soiled wool. When the Nacconol is used at a strength of 0.05 per cent there is practically no washing; at 0.2 per cent or 2 parts per 1,000 the washing is practically complete. By the time a 0.6 per cent concentration is reached, washing action is falling off; at 0.8 per cent the washing is no better than was obtained at 0.1 per cent, although 8 times as much Nacconol is used. No detergent should be tested at high concentrations with the idea that the greatest effect will be obtained.

Figure 3 is the first of a series of three slides comparing Nacconol with soap. The wool used in this test has a very heavy soil that is difficult to remove. The dark squares show substantially no washing. First, note that the soap at 0.3 per cent

concentration gives a white washing in 20 minutes, and that the longer time the washing is carried on using soap the whiter the wool is. With the Nacconol a white wool is obtained at 0.2 per cent concentration or two thirds the concentration of the soap, and the organic content of Nacconol is only 40 per cent as compared to soap because of the supplemental use of sodium sulfate. The actual organic material required for a white washing in the case of the Nacconol is only 25 to 30 per cent as much as in the case of soap which is practically pure organic material.

Another characteristic of the Nacconols is their rapid action. You will note that the Nacconol gives substantially complete washing in two to five minutes while the soap requires 20 minutes. This quick action is very desirable in washing things like wool blankets or sweaters where prolonged washing changes a soft, fluffy material to a stiff feltlike fabric. The longer wool is washed the more it shrinks.

Figure 4 shows the same test as does Figure 3 but was made in Buffalo city water which is about 7° hard. Note that the washing with Nacconol is substantially unchanged, while soap has lost its ability to make this wool white within the limits of this test.

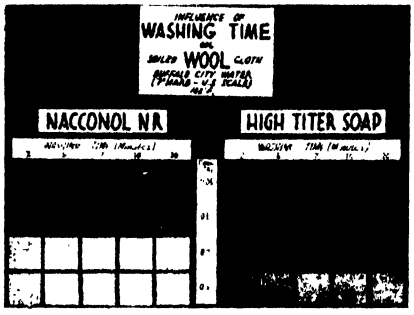

Figure 4

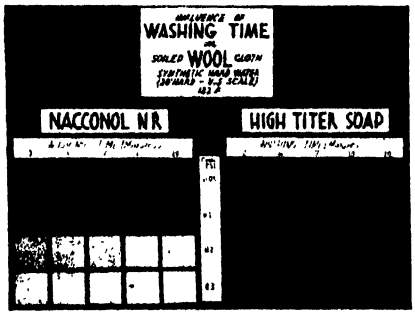

Figure 5

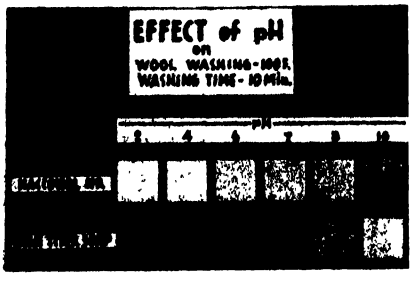

Figure 6

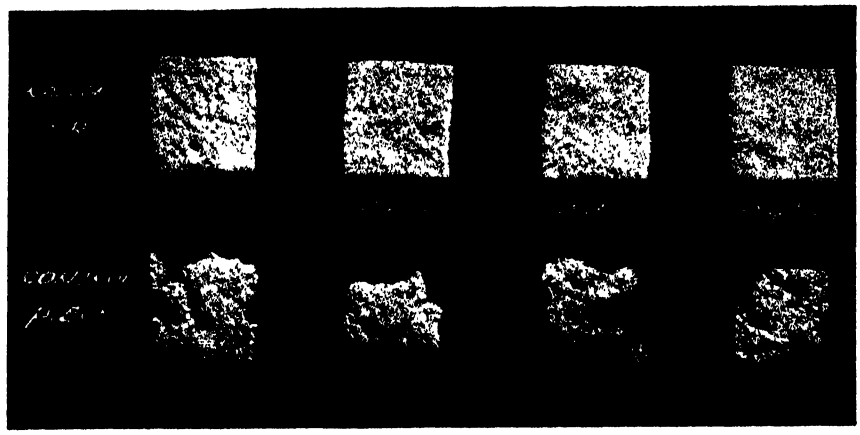

Figure 7. Moth repelling action of Nacconol NR

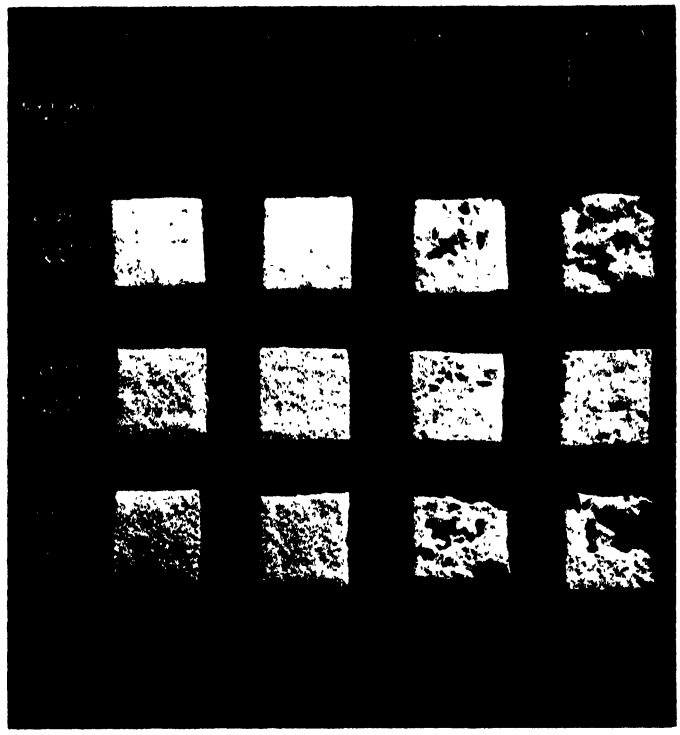

Figure 8. Mothproofing action of Nacconol NR

Figure 5 shows the washing in 20° hard water where soap has lost all its washing action within the limits of the test. The Nacconol on the other hand still shows a fine washing action.

Soap must be used in alkaline solution. Alkaline solutions are damaging to many products such as paint, linoleum, and wool. Many industrial operations, such as acid dyeing and pickling, are carried out advantageously in neutral or acid solution. Figure 6 shows the effect of the hydrogen-ion concentration on washing. As solutions become strongly alkaline, soap increases in efficiency. In neutral or acid solution it becomes worthless. A hydrogen-ion concentration of 10 is about that of a weak modified soda solution. The Nacconol, on the other hand, is effective in neutral solutions and is excellent in strong acid. In strongly alkaline solutions it is not so effective although it still shows a considerable washing action.

Nacconols are insecticides. Whale oil soap was used as an insecticide, but unlike whale oil soap the Nacconols are retained by a substantive action of the wool. They are held in small amounts by the wool much as a dye might be held. Figure 7 shows the moth repellent action of Nacconol NR. In this test the wool washed with Nacconol and moth eggs are placed in the same container as a piece of unwashed wool. Vitamin B is added so that the moth larvae will thrive. In all cases the larvae made a good meal of the unwashed wool. In the case of the washed wool there is a slight attack at 0.1 per cent, a very slight attack at 0.2 per cent, and no attack at 0.3 or 0.4 per cent.

Figure 8 shows mothproofing action as compared to the moth repellent action shown in the last slide. It also shows the effect of water rinsing after washing. In these tests there is no untreated wool for the larvae to thrive on. They must eat

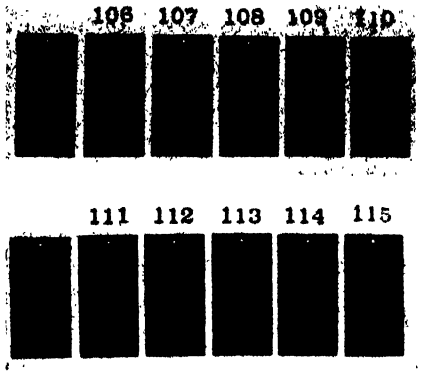

Figure 9

the Nacconol washed wool or die. Here 0.2 per cent of Nacconol is adequate protection since there is no untreated wool for the larvae to grow on. The wool sustains one light rinse without loss of its mothproofing action, and some mothproofing action remains even after the third rinse. Wool washed with 0.1 per cent Nacconol NR sustained moth larvae when they had to eat it, although where other wool was available the moth larvae ate very little of the wool washed with 0.1 per cent Nacconol NR.

Many alkaline cleaners are used particularly in the metal industry. In some cases it is necessary to have better cleaning than is obtained from the alkaline solutions alone. When Nacconol NR is added to improve the cleaning of alkaline solutions, small additions of 5 to 10 per cent based on the weight of the alkaline salts are extremely effective. Large additions generally offer no advantage over the small additions and, since Nacconol costs more than alkaline salts such as sodium phosphate, sodium silicate, caustic soda, and soda ash, it is uneconomical to add more than 5 to 10 per cent. The effect of this small addition is shown in Figure 9. This is a series of metal strips treated with oil and cleaned. The strips are then photographed under ultraviolet light where the oil residues fluoresce and become readily apparent. The upper row shows oiled steel cleaned with a 5 per cent solution of sodium metasilicate. At the left is a blank of unoiled steel; then the cleaned strips. The oily residue is very evident, although this is a good cleaning solution. The different strips represent 2, 4, 6, 8, and 10 minutes' washings without scrubbing. The second row is washed in the same way with a 5 per cent solution of a mixture of 95 parts of sodium metasilicate and 5 parts of Nacconol NR. All of the plates compare favorably with the clean reference strip at the left.

Figure 10 shows the number of dinner plates which can be washed with 5.6 grams (about 0.2 ounce) of soap or Nacconol in 6 quarts of water. Each plate is soiled with 2 teaspoons of a mixture of grease, vegetable juice, and flour. The Nacconol is dissolved in the water and a suds is beaten up. Plates are then washed until the suds are gone. The stacks of plates in back are those washed with Nacconol; the stacks in front are washed with soap. Water which is 3° hard is known as soft water. The Nacconol in this water washed 22 plates, while soap washed only 16 plates. Water 7.5° hard is equivalent to Buffalo city water. In this water the number of plates washed with Nacconol increased to 25 while the number of plates washed with soap dropped to 4. In water of 20° hardness, 5.6 grams of soap in 6 quarts of water is not enough to wash any dishes. With the Nacconol the number of plates washed in 20° hard water is 40 per cent greater than the number which could be washed in soft water.

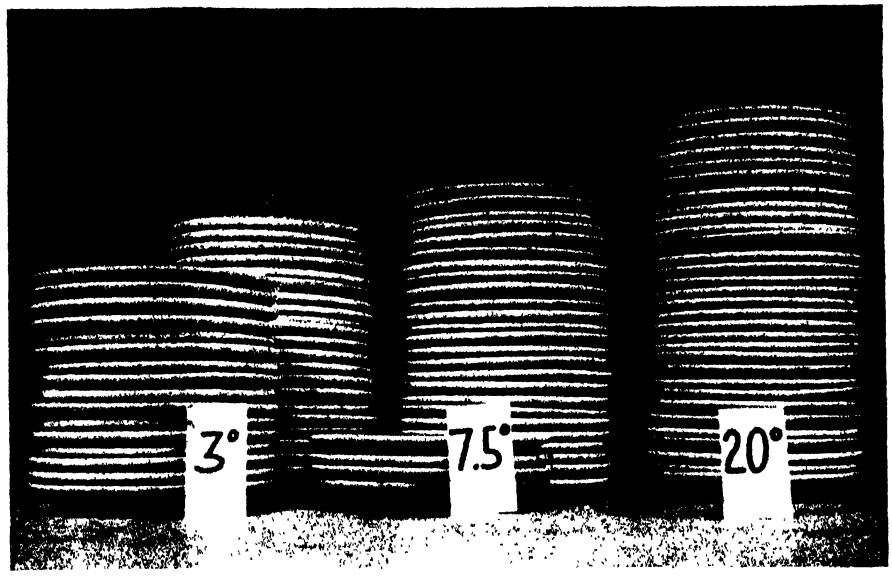

Figure 10

The principal uses for the new detergents are those in which soap is at a disadvantage for one reason or another. For example, special Nacconols are used in foods where the taste of soap is objectionable. They can be used to make an angel food cake which seems to melt in the mouth. Weak solutions of Nacconol NR are used to wash insects and insect fragments from vegetables such as broccoli, spinach, and lettuce. From petroleum products we have produced special detergents which are completely odorless and tasteless.

The Nacconols are used in dentifrices. Enameled woodwork, painted houses, and automobiles can be washed with a tablespoonful of Nacconol in a pail of water. The solution is neutral and does not dull the glossy finish of the coating material. It may be easily rinsed, and the surface will dry clean without polishing. Nacconols are useful in nonaqueous mediums and they disperse pigments in enamels. They clean in a dry cleaner's solvent much as soap does in water. In lubricants they keep the inside of automobile engines clean. They enhance the fungicidal properties of oils and keep leather clean while it is being defatted.

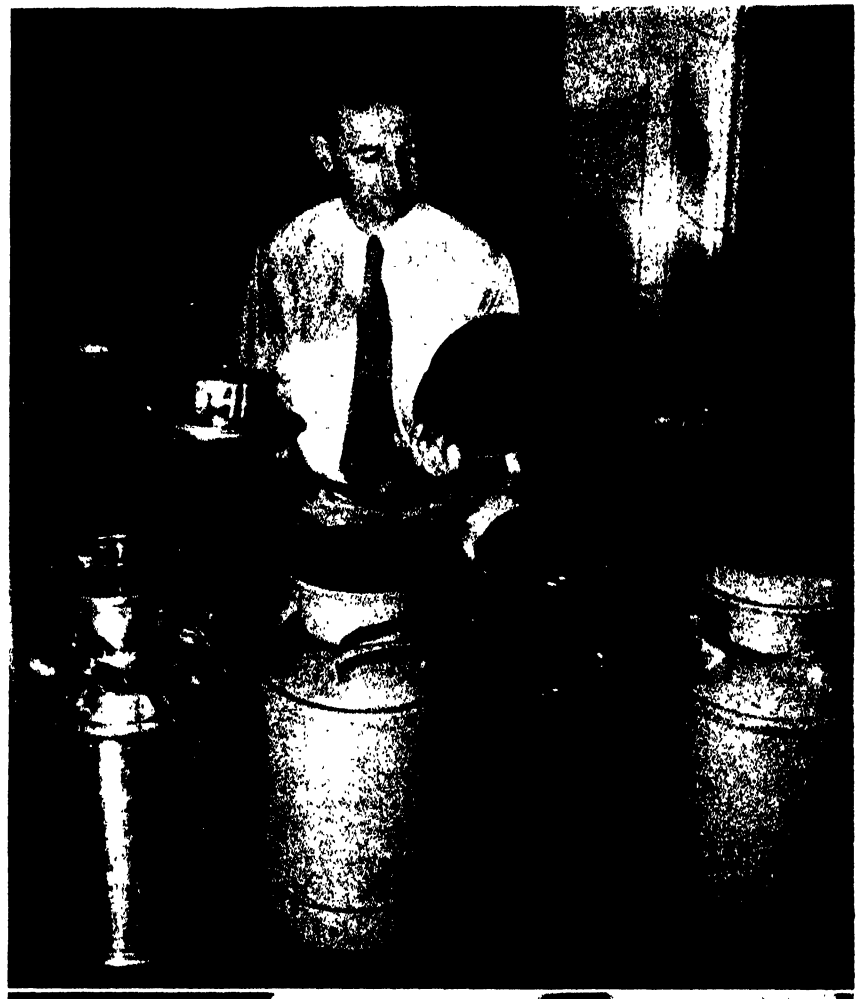
The chemist uses small amounts of Nacconols to speed chemical reactions and to obtain uncontaminated precipitates. Many special uses are made of the new washing agents because of their powerful antiseptic action. Bacteria do not grow in the ordinary Nacconol washing solutions. Such solutions are also powerful insecticides and fungicides. A Nacconol solution is particularly valuable to clean a cellar infected with mildew or insects. For such uses do not bother to rinse the solution off after washing. In tanning leather Nacconol assists the tanning. It is a mild tanning agent by itself. It keeps the leather clean and uniform. Nacconols are used in laundry work and dishwashing where it is desired to reduce bacteria counts. A pile of dinner plates washed with the Nacconol squeaks when you move it because there is no fatty soap residue left to lubricate the surface of the plates. Many people are allergic to soap, particularly in hard water areas. Nacconol NR is used to wash diapers to avoid diaper rash which often is an allergic reaction to lime soap. A special product called Dermanac is prescribed with which people who are unable to use soap can wash. Nacconol added to the bathtub before drawing the bath gives an amusing and cleansing layer of bubbles, and when the water runs out there will be no soap ring around the tub. Wool blankets washed in a tub of almost cold water with a cup or less of Nacconol for three to five minutes and hung in the breeze to dry are enticingly soft, beautifully cleaned, and obnoxious to moths. Since they are not washed long they do not shrink so much as they ordinarily would in washing.

Hot water is a problem with the dairy farmer since the barn is always a long way from the house, but the detergents from petroleum are effective washing agents in cold water and, because the washing solutions are antiseptic, serve to protect the

milking equipment. Because the Nacconol NR emulsifies odoriferous oils, it is valuable for washing dogs. Since the washing solutions are neutral they do not hurt the dogs' eyes, but because the solutions are insecticidal they devastate the fleas.

In acid baths where steel is pickled to remove the rust, soap would precipitate, forming fatty or oily acids. The Nacconols are stable in acid. They not only serve to clean the steel during pickling, but they protect the steel itself from attack by the acid. In electroplating baths the heavy metal salts precipitate the heavy metal soaps. The Nacconols on the other hand are adequately soluble and serve to avoid pits, pinholes, and other plating difficulties.

Very few persons realize the extent to which Nacconol used industrially influences the things they wear, the things they eat, and the things they use. Every one has benefited unknowingly from its industrial application.



New Zealand Government Plans Mica Development

PLANS for exploiting, under national restrictions, of what are believed to be extensive mica deposits are reported from New Zealand. Preliminary geological examination is said to warrant a more detailed survey, deposits being reported over an area of 89 square miles at elevations of 4,000 and 5,000 feet. It is planned to check indiscriminate licensing, to ensure the area being worked for national and allied benefit under existing mining laws and, if these are not adequate, by special emergency powers.

FORMATION recently of a company in Hungary to produce plastics and synthetic resins, rubber, and leather has been reported from abroad. The company, Hungary Plastics and Chemical Works, Ltd., is said to be capitalized at 2,000,000 pengo.

Lacquer Substitute for Tin Coatings

Above. **Paul D. Watson, chemist in the Bureau of Dairy Industry, U. S. Department of Agriculture, contrasts two milk can covers. The one at left is an ordinary tin-coated cover; the other a cover coated with the lacquer he has developed as a substitute for tin on cans for evaporated and condensed milk and for cheese. To test the practicability, the lacquer-coated milk cans, along with tin-coated cans for comparison, are used to haul milk to the department laboratories in Washington, D. C., from the department's dairy farm about 13 miles away in Beltsville, Md.** ***Below.*** **In working out the lacquer formula, samples of dozens of different combinations of materials were baked on glass dishes (in foreground) and small steel strips, and subjected to various tests. The lacquer that proved most promising consists essentially of lactic acid and vegetable oil.**

Ordnance Department Plastic Developments[1]

E. T. McBRIDE

Office of Chief of Ordnance, War Department, Washington, D. C.

When the President declared a limited national emergency two years ago, it was apparent that aluminum, brass, and zinc would become strategic. As the emergency developed and the United States became the arsenal of democracy it was also apparent that substitutes would have to be found for these metals in many applications. The Ordnance Department immediately investigated the possibility of substituting plastic materials for critical metal in some of its materiel.

The substitution program is an effort of the Ordnance Department to conserve highly strategic materials and utilize the less strategic. Plastics, although critical, are more available than the metals formerly used, but plastics are not metals and they cannot be expected to reproduce the physical properties of metals. They are expected to provide moldings having adequate strength characteristics, stability, and temperature resistance.

When a metal is declared critical by the War Production Board, immediate action is taken to effect a substitute for that metal. This substitute must be satisfactory to the using services from the standpoint of its ability to function efficiently wherever the theater of operations may be. It must be readily available in quantity at a nonprohibitive price and capable of withstanding long periods of storage in various climates under the most adverse conditions. It must provide permanence of form and resistance to wear, abrasion, and impact, whether in the subzero weather of the Arctic outposts or the torrid humidity of the tropics. At this time only the thermosetting compounds show definite promise. They alone have satisfactorily filled ordnance requirements. For these reasons thermoplastics have never generally been approved for materiel manufactured for the combat forces.

The Small Arms Division, for example, has been particularly active in plastic substitution. For almost a year this organization considered plastics for the M-1 rifle stock and hand guard, the Browning automatic rifle stock, and machine gun belt links. Although satisfactory results have been obtained in utilizing special phenolic molding compounds for the Browning automatic rifle stock, it has been shown that plastics have not reached the state where they can take the place of black walnut generally. The automatic rifle stocks are slightly heavier than the wood, but the mechanical properties of the material compensate for this excess in weight by their ability to withstand the cracking that the wood was subjected to when certain parts of the firing mechanisms traveled to the rear. This stock has been standardized as a molded fiber-filled phenolic. Plastic substitution for the M-1 rifle furniture has been abandoned because of the cost, weight factor, tendency of plastics to absorb and hold heat, and relatively poor flexibility. The belt link, believed an ideal thermoplastic application, cost too much, stretched under the weight of the ammunition, warped, and fouled before reaching the guns. The rifle-bore reflecting device, formerly a brass component, has been shown to be an ideal plastic application. This device is inserted in the breech of the rifles and machine guns for the purpose of examining the rifling to locate fouling, powder contamination, and defects in the bore.

This group has found that molded grips and handles, being exact replicas for the dies in which they were molded, ensure uniform and accurate assembly. They have found that grips and handles for pistols, machine guns, and bayonets which are far superior to walnut furniture may be obtained at no extra cost. They have, therefore, termed as "alternate standard material" any medium impact phenolic having an impact strength of 0.23 foot pound energy to break, as determined by the Izod notched bar impact test, which can meet requirements of Springfield Armory's tentative specification for molded phenolic shapes.

Thermoplastics, although they do not generally meet Ordnance Department specifications, have contributed to the development of this program. The bayonet scabbard on which Rock Island Arsenal prepared a tentative specification is a cotton mill duck impregnated cellulose acetate butyrate composition. Although a large number of these scabbards have been procured, a variety of thermosetting samples are being investigated and a comparative destructive test is being made with the hope of standardizing a scabbard best capable of withstanding storage, weathering, and combat usage.

The Ammunition Division has also been actively investigating utilization of plastics. The well-known M-52 fuse is an excellent example of cooperation between the Army and industry. This item is now a standard plastic ammunition component and has shown itself to be highly satisfactory when fired from the 60-mm. and 81-mm. trench mortars. This fuse is molded from a medium impact phenolic by the transfer process. The windshield for 37-mm. armor-piercing ammunition will require high-impact rag-filled phenolic which is not only capable of withstanding "setback" stress, a force generated on firing, but also the rotational forces of flight without breaking or separating from the projectile before reaching the target. Setback is the inertia set up in the gun at the moment of firing. It results in a compressive stress and is measured as pounds of pressure per pound weight of projectile. Experimental development of plastic 75-mm. windshield has been suspended by the Ordnance Department because of constant setback failures encountered in firing. The setback in the 75-mm. gun results in a force of 17,000 pounds per pound weight of projectile. All plastic windshields of this caliber fired to date have exhibited longitudinal cracks which start at the threaded section. This shows that the differences in thermal expansion of metal and plastic are too great or the plastic materials do not have sufficient elasticity to give with the projectile.

The M-50 dummy fuse which is used for 37-mm. gun target practice has been classified as "plastic alternate standard". This fuse is not being procured as a plastic because the powdered iron component, which is also acceptable, has provided a more inexpensive source. The substitute for this aluminum compound must be capable of meeting with weight, weathering, and temperature requirements. The fuses must be concentric and perform satisfactorily in the gun, in flight, and at the target which may be 4,000 yards from the gun.

"Volume applications" or the use of plastics in ammunition components are definitely limited because of the inadequacy of modern plastics to meet ammunition requirements. In many cases plastic components have cracked badly in loading and feed mechanisms. In other cases, the temperatures of explosion exceed by far the upper limit of plastic temperature range. What is needed is a plastic material capable of withstanding high temperatures and high setback pressures simultaneously for short periods.

The scarcity of aluminum has made necessary a great deal of substitution by the rapidly growing Aviation Ordnance Section. Satisfactory materials are needed for booster cups and bomb detonators. The M-103 bomb fuse, once thought of as a practical application, will probably never become a plastic component because of the "drop safe" requirements which no

[1] Presented before the Division of Paint, Varnish, and Plastics Chemistry at the 103rd Meeting of the AMERICAN CHEMICAL SOCIETY, Memphis, Tenn., April 20 to 23, 1942.

plastic has ever been able to meet. To drop safe is to release a fused bomb in an unarmed condition from an airplane at, for example, an altitude of 8,000 feet. The bomb so dropped is expected to land without detonating, so that allied aviators may release bomb loads over friendly territory if a forced landing becomes necessary. The fabric-filled phenolic booster cup has also failed. This component when dropped 50 feet after 48 hours at −40° F. cracks and shatters.

Chemical bomb burster tubes permit the use of phenolic impregnated paper which is capable of being stored for long periods of time without entering into chemical reaction with the Tetryl burster loading.

This section is responsible for the design, development, and procurement of aircraft signals. A plastic base, which may be molded of high-impact phenolics, has been designed for a complete range of signals.

The Artillery Division is developing a number of fire-control components from plastic materials. Binocular eye- and endpieces for field glasses and telescopes are being molded from medium-impact phenolics. Protractors and range deflection fans are items where transparent plastics capable of retaining their original shape without warping may be used to advantage. The Frankford Arsenal has shown considerable interest in hand wheels and knobs molded with inserts for gun directors, aiming circles, and battery commanders' telescopes. These components also require medium-impact phenolics.

The Tank and Combat Vehicle Division has been investigating the possibility of using high-impact phenolics for elevating and traversing mechanisms on tank guns. These hand wheels will contain steel inserts and, if they are satisfactory with respect to durability, temperature resistance, and physical properties, will be considered for adoption.

There is a definite military requirement for "windshield blisters" on tanks. The required blisters are similar to the transparent domes used on bombardment aircraft and are fit over the tank commander's turret when on reconnaissance missions with the hatch open. The purpose of this windshield or blister is to protect the tank commander from dust, dirt, and gas fumes which may be present in high enough concentration to impair his vision. To be satisfactory for this component, a material must have superior abrasion resistance and ability to withstand tropical and arctic temperatures. It must not become yellow or crazed with age, and must have a light transmission of at least 90 per cent after an accelerated aging test.

The Ordnance Department is enlarging the gage industry to assure an adequate supply of the various gages so essential to the war effort. The American Gage Design Standards employ three types of handles, the taper lock design handle, reversible design handle, and the Bell handle. The handle, that portion of a gage which is employed as supporting means for gage member or members, was formerly made of aluminum. Now thermoplastic compounds capable of meeting Ordnance Department requirements are acceptable as alternate standard materials.

The Ordnance Department has no objection to the use of extenders which will conserve strategic raw materials used in the production of molding compounds, provided use of these extenders does not appreciably lower the physical properties or mar the appearance of the molded piece.

The department does not purchase resins or molding materials for the production of its plastics components. All the plastics applications now standard for manufacture and issue are subcontract items. In all cases the prime contractor is responsible for the manufacture of complete units of ordnance materiel. Molders who are interested in becoming subcontractors for the molding of plastic ordnance components should apply to the various Ordnance Procurement Districts for information concerning the plastic requirements of the prime contractors.

Ordnance Department Paint Developments[1]

E. T. McBRIDE, Office of Chief of Ordnance, War Department, Washington, D. C.

IN ORDER to understand fully the paint problems which the Ordnance Department has undertaken, a knowledge of what is expected of military finishes by the operating divisions is essential.

The Ordnance Department is responsible for the design, development, storage, supply, and maintenance of combat materiel, which includes small arms, artillery, ammunition, tanks, and combat vehicles. The department is organized into four groups, each with a particular function in the successful completion of the ordnance mission. It is the responsibility of the Industrial Service, the group interested in paint products, to design, produce, procure, inspect, and standardize all ordnance materiel. The Industrial Service, through its operating divisions and research engineering staff, conducts tests on experimental materiel, maintains technical liaison, and distributes technical information to the industry, which make it possible for the Ordnance Department successfully to accomplish the manufacturing phase of its mission.

The Small Arms Division, responsible for the design, development, and procurement of pistols, revolvers, pyrotechnic projectors, rifles, machine guns and machine gun mounts (not including those mounts used in combat vehicles), and ammunition for these weapons, presents an interesting field for development to the paint industry. It utilizes the lusterless olive drab enamels of the ES-359 type for the camouflage and protection of metal on machine gun mounts and on wooden ammunition.

The Ammunition Division from time to time has been faced with unique problems which the paint and varnish industry, in cooperation with Ordnance Department operating facilities, has successfully solved. The most remarkable current advancement in artillery ammunition has been aided by industry's development of a baked phenolic varnish for use on steel cartridge cases. When it was apparent that a shortage of brass would delay the production of cartridge cases, the Artillery Ammunition Division investigated the possibility of utilizing a thin gage steel. The development of a steel cartridge case necessitated protecting it against corrosion caused by weathering and the chemical action of the propellant loading. It was found that copper plating the outside of the cartridge case provides adequate protection against external corrosion. It was the inside of the case, therefore, that required the attention of the paint and varnish industry. In cooperation with the Ordnance Office and Frankford Arsenal, the industry developed a straight phenol formaldehyde varnish. This produces a smooth continuous film which does not chip or scale after drying. The dried film, although tough, is elastic and withstands the abrasion of the propellant loading without serious effect.

A varnish to meet the requirements of Frankford Arsenal's specification must be a straight phenol formaldehyde finish, clear and unpigmented. It must resist toluene, acetic acid, ammonium hydroxide, ethyl alcohol, and ethyl ether. The test film must withstand a baking temperature of 50° F. in excess of that recommended by the manufacturer without softening or otherwise deteriorating. When scraped with a sharp blade, the film must not flake or exhibit other evidence of poor adherence.

Another development of the Ammunition Division is the new method of bomb

[1] Presented before the Division of Paint, Varnish, and Plastics Chemistry at the 103rd Meeting of the AMERICAN CHEMICAL SOCIETY, Memphis, Tenn., April 20 to 23, 1942.

painting. In the past, the painting of bombs followed the customary painting of artillery ammunition. For example, the entire bomb was painted to correspond with an artillery shell of the same loading. The present method is to paint the entire bomb a lusterless olive drab and identify the loading by suitable striping. The lusterless olive drab paint used as a protective finish coating of the metal must dry to a dead flat and require no further painting. It must have good color retention and have no tendency to increase in gloss during storage or after application. Inasmuch as bombs are only given one coat of paint, that covering must be complete. The film must be tough and elastic, and must not chip or scale. Bombs, like other ordnance materiel, are often required to lay for some time in field dumps with little or no protection from the elements. In order to meet this requirement, the paint used for bombs must withstand an 18-hour immersion test in cold water without whitening, fading, softening, checking, or failing in other respects.

Artillery shell is still being painted solid colors to indicate shell loading. Paint used for artillery ammunition must withstand weathering and handling without undue chalking or chipping. It is important that the color be maintained and that it be readily distinguished even though splattered with mud. Numerous samples of yellow, for example, have been submitted which are altogether unsatisfactory because the color is not equivalent to the regular chrome pigment specified by the Ordnance Department.

Throughout the entire investigation of the Ordnance Department's paint substitution program, conservation of resins, pigments, oils, and solvents has been given prime consideration. When shortages of the essential raw materials were anticipated early last fall, the Ordnance Department joined forces with the Corps of Engineers, the Quartermaster Corps, and industry to effect satisfactory substitutions in the shortest possible time. A committee was formed by these three supply services of the Army in the Office of the Under Secretary of War, and liaison established with industry and the Protective and Technical Coating Section of the War Production Board. Six months of concentrated effort by the Army and industry team ended in April.

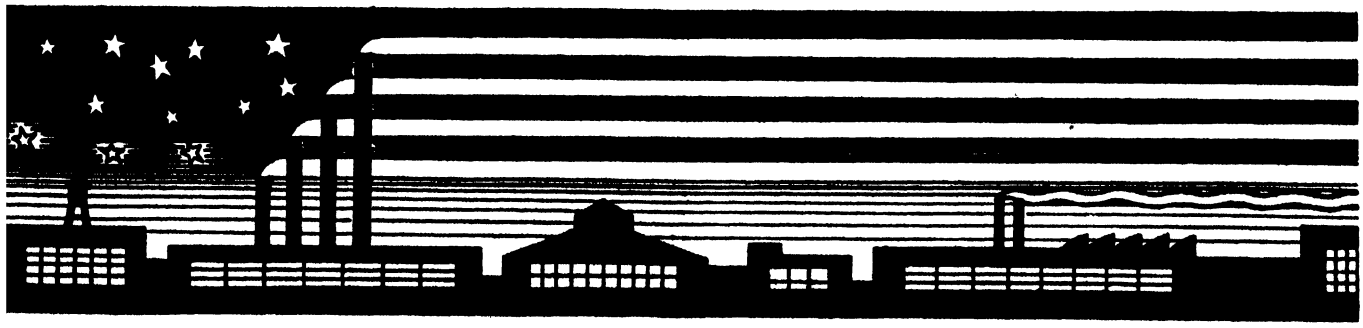
Panels of substitute olive drab finishes which had undergone a six months' exposure in Florida were brought to Washington and carefully inspected by the interested Services of Supply. Very little difference in fading and chalking was noticed between the straight and modified alkyd topcoats.

Many producers of high-grade finishes have sought the advice of the War Production Board on substitute oils for China wood oil, the supply of which is very limited. Specially treated castor or linseed oil may provide a satisfactory substitute. It is impossible at this time, however, to offer the industry definite advice as to acceptable substitutes because service tests have not been completed.

Conservation of chrome pigments has become mandatory. The use of lead chromate is a thing of the past, and the utilization of zinc chromate must definitely be reduced. The addition of organic dyes, lakes, or pigments is not generally considered favorable for use with military equipment owing to poor resistance to weathering. A satisfactory pigment is one which retains its color in the paint film, whether in Arctic or tropical theaters of operation. A pigment formulation based on yellow iron oxide and a minimum of zinc chromate has been investigated as a probable alternate.

Although alternate emergency enamels to replace the ES-474 have been investigated, the Ordnance Department requires enamels used on tanks and combat vehicles to be tough and flexible. Paint must withstand the abrasive action of low-hanging branches, weeds, and bushes without an appreciable scraping off of the top coat when these materiel are actively engaged in the combat area. It would be unreasonable to demand, of course, that the painted surfaces remain wholly intact under cross-country service, but they should withstand rough usage for at least six months. In general, paint has a definite military purpose when it is applied to combat materiel. The lusterless olive drab finish must provide not only corrosion resistance for the metal, but also must provide camouflage properties which enable the materiel when not actually in motion to blend with the surrounding terrain.

Although the substitution program is only six months old, remarkable gains have been made in conservation and in the development of satisfactory finishes for ordnance materiel. These advancements, which will have a decided effect on the successful conclusion of our war effort, are appreciated by the Chief of Ordnance, who wishes to thank the paint industry for its untiring efforts and cooperation.



Electrons—Homo Sapiens

Among the various luncheon clubs now active in North America, all marked by highly efficient, somewhat complex organizations and guided by lofty ideals, is one, the Electrons, which is entirely unique. Perhaps its singularity accounts for its healthy, progressive 17-year existence. Or perhaps the Electrons of western New York State have demonstrated that simplicity of organization and a spirit of rousing good fellowship have real social and scientific value.

The Electrons, who meet for luncheon each Wednesday noon in Niagara Falls, N. Y., were founded by eight eminent chemists of the Niagara Frontier on May 12, 1925. They were W. Judson Marsh, V. L. Bohnson, Harvey Gilbert, F. L. Koethen, R. L. Nelson, C. E. Taylor, M. C. Taylor, and J. R. MacMillan.

After about a year the individual members decided to call themselves "Electrons". The purpose of symmetry was secured by giving their chairman the title of "Nucleus", a position first held by Dr. Marsh. Continued growth of the organization made necessary the services of a secretary, appropriately dubbed "Photon". With these two officers and temporary committees for special occasions, the Electrons have continued to function smoothly.

Luncheon is served in one of the hotels in downtown Niagara Falls at 12:15 P. M. every Wednesday. Each member pays for his own lunch. Something less than three quarters of an hour is usually devoted to the "inner man". The speaker is allotted about 30 minutes. A short period of questions usually follows the talk, and the meeting is adjourned

Electron dowsing

soon after 1:30 P. M. The Nucleus presides at the meetings and is responsible for the weekly program. The Photon performs the secretary-treasurer's traditional duties. Finances are as informal as the rest of the organization. The very modest obligations are met by an occasional unannounced "hat-passing" at a regular meeting. Membership is open to all members of the chemical profession employed along the Niagara Frontier and involves only attendance at the meetings. Those regularly attending expect to meet between 25 and 30 of their fellow Electrons each Wednesday. This organization as outlined above is pure tradition. It has never enjoyed a formal written statement.

Early Electron meetings, following a pleasant luncheon, were devoted to the discussion of a recently completed piece of original research by one of the members. As the Electrons became more numerous the scope of the programs broadened. Time, however, proved that weekly discussions soon exhausted this source of programs, fertile as it was. Outside speakers were first invited to discuss only scientific subjects. Eventually topics of general interest appeared on the program. Members are still given ample opportunity to speak, and contribute a substantial proportion of the programs.

Stag attendance is the rule at the weekly meetings. The Electron group was almost five years old before the ladies were noticed in the group's inimitable informal manner. An evening meeting was scheduled with "ladies included", as the announcement stated. The speaker was F. H. Snyder and his subject "Fallacies and Facts about Catalysis". However, this misjudgment of the ladies' interests was corrected on the occasion of the fifth anniversary of the founding of Electrons. A banquet complete with original entertainment and followed by dancing was the first of the now annual "Ladies' Nights" held each year about the middle of May.

Other than the weekly meetings, the Electrons have occasionally indulged in some other functions. Among their early contributions to the A. C. S. was their entertainment at the 82nd meeting of the AMERICAN CHEMICAL SOCIETY in Buffalo, N. Y., in the fall of 1931. On the Wednesday afternoon of that convention, a committee of Electrons headed by R. B. MacMullin and Carl W. Tucker presented an exhibition baseball game in Victoria Park, Niagara Falls, Ontario, for the entertainment of the ladies attending the convention. One team was made up of renowned chemists of the past including Pasteur, Wohler, Lavoissier, Perkins, Priestley, and Mendeléeff, each identified by a large card around his neck. The opponents impersonated well-known living chemists in attendance at the convention and were similarly identified by cards. The ball game was good entertainment, but the garden party that was to follow was marred by rain. The guests were taken into the Clifton House to view, from a vantage point high and dry, the spectacle of Niagara Falls illuminated. With the usual Electron policy of "turn about is fair play", it had been planned to reverse

Electrons entertaining the ladies

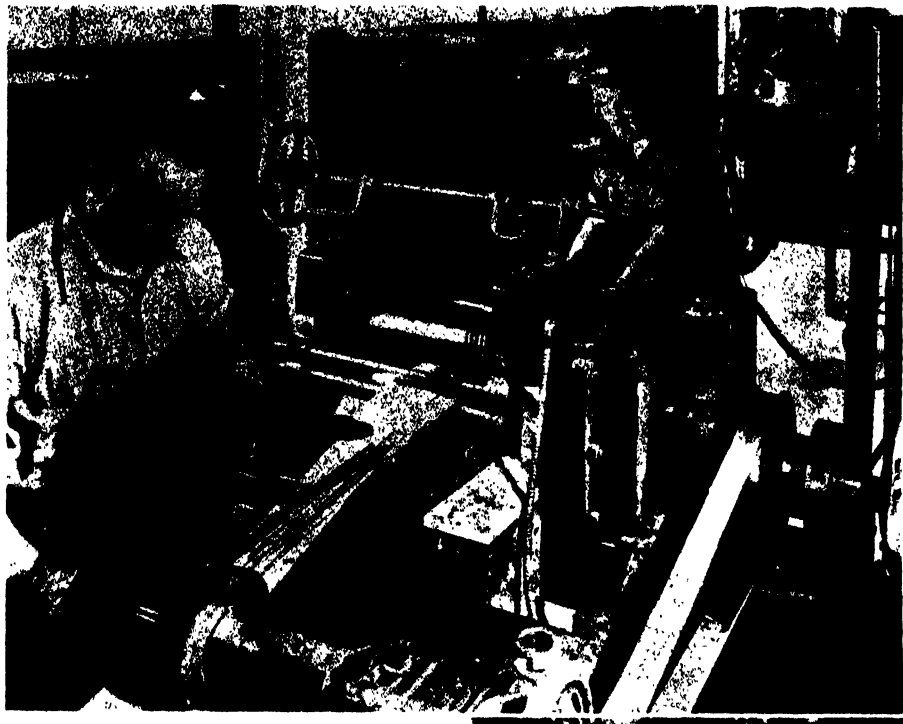
the order later in the evening and treat the Falls to the spectacle of the guests illuminated. Accordingly the refreshments supplied by the Electrons included about $150 worth of beverages which could not be obtained legally in the United States at that time. Because of the inclement weather the refreshments were not consumed. Apparently the weather cleared a week or so later, however, because Electrons who were there at that time reveal that a "liquidation party" was held in a boathouse on the Chippewa River.

At the AMERICAN CHEMICAL SOCIETY meeting in Rochester, N. Y., in the fall of 1937 one of the honored guests was N. V. Sedgwick, the world authority on electrons, from Lincoln College, Oxford University, England. Great was Professor Sedgwick's surprise and pleasure at being confronted with 42 real living Electrons at their regular Wednesday meeting held in Rochester for the occasion. This was the first Electron luncheon held in connection with a national A. C. S. meeting.

Later in the fall of 1937 Burrows Morey, an eminent Electron, now an adviser to the Board of Economic Warfare, addressed the Electrons on "dowsing" or the location of underground water supplies with the aid of a forked twig. This subject understandably aroused so much discussion among the Electrons that Electron Paul Magill offered the use of his farm for experimental purposes. An entire Saturday afternoon was devoted to the study of this phenomenon with interesting, if not conclusive, results.

Of all the varied programs the Electrons enjoy, their annual Ladies' Night invariably receives special attention. At the time when there was much talk of food concentrates, Electrons and their wives sat down to the Ladies' Night banquet to find a single large pill in the center of each dinner plate. They were solemnly assured by the committee in charge that the pill represented and included their entire banquet. Howls of anguish from hungry Electrons soon brought a full-course dinner, this time in the usual form.

Another memorable occasion was the Ladies' Night held soon after the manufacture of dry ice was started on a commercial scale. The dessert was served in the form of bowl-shaped blocks of dry ice. Pitchers of a creamy liquid were served. The guests were advised to fill their dry ice bowls with the liquid and stir, thus making their own ice cream. It worked!



Before national defense prevented groups from visiting manufacturing plants, the Electrons occassionally toured one of the near-by factories. On one occasion they went to the Corning Glass Works in Corning, N. Y., to inspect glassmaking operations. In past summers, picnics followed by softball games on Goat Island in the Niagara River have been enjoyed by the Electrons. They have also acted in an advisory capacity to the Niagara Falls libraries and technical schools. With the exception of the Wednesdays in the Christmas holidays and before each Ladies' Night, there has not been an interruption in weekly meetings since 1928.

The yearly election of officers, held in the early fall, is a time of great acrimony and many harsh words. Candidates chosen by a "fixed" nominating committee are thoroughly maligned by their opposing campaign managers to prevent their election. With the ballot box stuffing that usually ensues, the Electrons are not always certain just how their consistently competent Nuclei and Photons get into office.

C. Vincent-Daviss in 1938 summed up the attitude and spirit of the Electrons most suitably. He said, "Electrons are naturally gregarious. Their natural, keen, enthusiastic interest in things scientific and unscientific is the greatest asset of the organization."

For indispensable help in the preparation of these notes, gratitude is rendered to Electrons R. C. Benner, G. J. Easter, R. R. Ridgway, M. C. Taylor, A. J. Gailey, R. M. Fowler, H. L. Robson, and the present Nucleus and Photon, R. B. Elliott and H. S. Schroeder, respectively.

War Brings New Uses for Silver

Left. These workers at Handy&Harman, New York, are cutting brazing alloy strip from sheets of silver alloy. The strips will be formed into rings and used in pipe fittings on merchant and war ships. *Below.* Silver brazing alloy wire is drawn on a multiple die machine. This wire, 50 per cent silver, is widely used in building war materials.

WIDE WORLD PHOTOS, INC

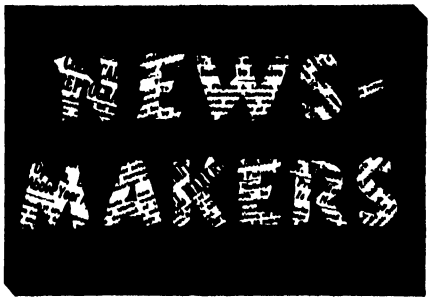
Allis-Chalmers Opens Plant for Navy

JUST 90 days and a construction technique borrowed from World War I were needed to make ready a new plant for production of Navy material at the Allis-Chalmers Mfg. Co. The plant was the second big Allis-Chalmers war production unit to begin operating within the month. Electrical control equipment will be manufactured in the new building, which will begin to operate as a 100 per cent Navy plant.

The emergency building covers an area of 200,000 feet. Its wood construction was adopted to cut construction time to a minimum and to conserve critical materials. Practically the only metal used in the building are the metal caps, produced in Allis-Chalmers' own foundry, at the ends of timber tresses and columns.

Eire Cement Manufacturer to Augment Fertilizer Shortage

AS PART of a Ministry of Agriculture program to offset a shortage of artificial fertilizers, a cement firm of Eire has agreed to market at nominal cost a potash lime dust by-product of its cement manufacture. The product is valued primarily for its lime content, but contains also from 2 to 3 per cent potash, making it adaptable for tillage crops at a rate of 1 to 2 tons per acre, it is reported.



POSSIBILITY of converting phosphate rock, found in quantity in South Africa, into soluble phosphate fertilizer is being studied in that country as part of a general program to develop native base mineral resources.

Chemical Container and Storage Fellowship Established

A MULTIPLE fellowship on chemical containers and storage has been established by Pittsburgh-Des Moines Steel Co. at Mellon Institute of Industrial Research. The senior incumbent of the fellowship is James Bert Garner, best known for his achievements in hydrocarbon chemistry and technology. He is aided by Ludwig Adams, a specialist in engineering materials and welding, and by R. M. Stuchell, a research metallurgist. The Chemical Storage Fellowship will work on all bulk-chemical storage problems in industry, with special current emphasis on hydrocarbons. Of particular urgency at present, it is stated, is the work of the fellowship staff on storage in the synthetic rubber industry, including the basic chemicals, butadiene, styrene, acrylonitrile, and isobutylene.

Process for Nonstaling Baked Goods Patented

ATLAS POWDER CO. is assignee of patent 2,285,065 on nonstaling baked goods, granted to Walter A. Taylor of Tamaqua, Penna. Secret of Mr. Taylor's process is the incorporation of a small amount of sorbitol which is firmly associated with water. Its presence helps keep bread, cake, and other bakery products from drying out.

Richard A. Bardwell, employed in the railroad field service of the National Aluminate Corp., had the degree of chemical engineer conferred upon him at the June commencement exercises of the University of Florida.

E. St. Pierre Bellinger has resigned his position with the Hercules Powder Co., where he was assistant superintendent of the Hercules, Calif., plant, to accept an appointment as captain in the Army Ordnance.

William M. Black

William M. Black has been appointed a vice president of The American Brake Shoe and Foundry Co. He has been president of the company's American Manganese Steel Division, Chicago Heights, Ill., since 1940 and will continue in that capacity.

Gardner H. Chidester, for the past 16 years closely associated with sulfite and semichemical pulping process investigations as a member of the U. S. Forest Products Laboratory's Division of Pulp and Paper, has been appointed chief of that division, succeeding the late **C. E. Curran.** Currently, the division is occupied with wartime research problems, including the development of substitutes from pulp and paper for critical war materials, diversification of species for pulping, and methods for improving pulp yield.

Edward Croft, Jr., has been appointed assistant chemist in the Chemical Warfare Service, where his principal duty will be the preparation of abstracts for the use of the service. Much of this work is of a highly confidential nature.

Milton M. Croom, for the past six years chief chemist for The Springs Cotton Mills, Lancaster, S. C., has been commissioned as lieutenant in the U. S. N. R., and has reported for active duty in Boston, Mass.

J. A. Danner, after more than 25 years' service with the Standard Oil Co. of Indiana, Chicago Division, retired on June 12 under the company's pension plan. His place as industrial sales promoter is being taken by **Harry G. Stiles.**

Arthur R. T. Denues, until recently the engineer in charge of the Explosives Research Unit, Explosives Division, U. S. Bureau of Mines, is now on active duty as a first lieutenant in the Chemical Warfare Service, Edgewood Arsenal, Md.

Charles B. DeWitt is now working as research chemist with Kalunite, Inc., Salt Lake City, Utah. He was formerly associate professor at John Tarleton Agricultural College, Stephenville, Tex.

Mrs. Sarah Vance Dugan, director, Bureau of Food, Drugs, and Hotels, State Department of Health, Kentucky, was elected president of the Association of Food and Drug Officials of the United States at its meeting on June 3. **Hermann C. Lythgoe,** director, Division of Food and Drugs, Massachusetts Department of Public Health, was elected vice president.

Howard N. Eavenson

Howard N. Eavenson, Pittsburgh mining engineer and consultant, has been reelected president of Bituminous Coal Research, Inc., the research agency of the bituminous coal industry and affiliate of the National Coal Association.

Fred W. Elliott has been named a research engineer on the technical staff of Battelle Memorial Institute, Columbus, Ohio, assigned to the Division of Organic Chemistry. Mr. Elliott was previously associated with the By-Products Division of the Jones & Laughlin Steel Co.

Charles L. Faust

Charles L. Faust, chemical engineer, Battelle Memorial Institute, has been named to a five-year term on the board of managers of The Electrochemical Society.

H. B. Feldman has been transferred from Edgewood Arsenal to the War Department Civilian Protection School at Amherst, Mass , where he is an instructor.

Thomas B. Gibb, Jr., Joseph H. Leuner, Walter A. Miller, Robert E. Muller, Richard E. Nicolson, and **Philip F. Wangner, Jr.,** have joined the staff of Bakelite Corp.'s Research and Development Laboratories, Bloomfield, N. J.

John W. Greene is on leave from his position as associate professor of chemical engineering at Kansas State College and is employed as chemical engineer in the Plants Division, Edgewood Arsenal, Md.

Hugh A. Hamilton, Jr.

Hugh A. Hamilton, Jr., chemistry professor at Park College, Parkville, Mo., for the past two years, has moved to Radford, Va., to accept an appointment with

the Hercules Powder Co. In the fall, Mr. Hamilton expects to be transferred to a government plant in Wisconsin, where he will be a supervisor of TNT production.

Major E. R. Harrouff, Chemical Warfare Service, was called to active duty at Edgewood Arsenal, Md., May 15, 1941. After six months' service at Edgewood Arsenal he spent six months in the Manufacturing Department of the Industrial Service Division, Office of the Chief of the Chemical Warfare Service, Washington, D. C. In May 1942 he began a new assignment in the Procurement Department of the Administrative Division at Pine Bluff Arsenal, Chemical Warfare Service, Pine Bluff, Ark.

H. B. Hass, head of the Department of Chemistry, Purdue University, was awarded an honorary doctor of science degree at the recent centennial celebration of his alma mater, Ohio Wesleyan University.

Frank J. Hill has been elected vice president of Greene, Tweed & Co., New York. Mr. Hill has been connected with the company since 1915 and has been sales manager for many years.

J. E. D. McCarty has been appointed director of ignition research of Simmonds Aerocessories, Inc., 10 Rockefeller Plaza, New York, N. Y.

H. Kennedy McCook, wartime priorities specialist, has joined the Washington staff of the National Association of Manufacturers to assist in coordinating activities of the N. A. M. War Committee with those of the government war agencies. Mr. McCook at one time served as head priority specialist of the Materials Division of OPM.

R. B. McKinney has been appointed assistant general manager, Paper Makers Chemical Department, Hercules Powder Co. He joined the Hercules organization in 1913.

William H. McPherson, Jr., 1942 graduate of Syracuse University, received the 1942 Syracuse Section Award of a membership in the AMERICAN CHEMICAL SOCIETY, presented annually to a high ranking senior in one of the colleges in the section's territory. He will pursue graduate work at the Institute of Paper Chemistry, Appleton, Wis.

J. P. Madden has been transferred to the New York office of the Stauffer Chemical Co., where he will handle the sales of industrial chemicals.

Orville E. May, director of the U. S. Department of Agriculture Northern Regional Research Laboratory, Peoria, Ill., has been appointed a research coordinator on the staff of **E. C. Auchter,** agricultural research administrator. **Horace T. Herrick,** assistant chief of the Bureau of Agricultural Chemistry and Engineering, succeeds **Dr. May** and is in turn succeeded by **Carl F. Speh,** who has been giving special attention to the bureau's war research.

George W. Perkins, executive vice president and treasurer of Merck & Co., Inc., Rahway, N. J., has been granted leave of absence to serve as lieutenant colonel in the Chemical Warfare Service, Washington, D. C.

C. F. Pittman, manager of the motor division of the industrial department of General Electric Co., Schenectady, N. Y., has been made assistant to the manager of the industrial department.

Herschel E. Post has been appointed general sales manager, industrial finishes, Pittsburgh Plate Glass Co., Pittsburgh, Penna. He was previously manager of the company's paint factory at Houston, Tex.

Reuben Roseman has been commissioned as first lieutenant in the Sanitary Corps, Army of the United States, and has entered active duty at Fort Jackson, S. C.

At the 55th annual commencement exercises of the Michigan College of Mining and Technology at Houghton on June 1, **Jarvis L. Schwennesen,** Grand Rapids, Mich., the high ranking junior in chemistry or chemical engineering, was awarded a junior membership in the AMERICAN CHEMICAL SOCIETY and a one-year subscription to *Industrial and Engineering Chemistry.* This annual award is sponsored by Chi Epsilon Chi, local honor fraternity in chemistry and chemical engineering.

Recent additions to the research staff of the Pennsylvania Coal Products Co., Petrolia, Penna., include **Rodger D. Spencer,** formerly of the Research Department, Westinghouse Electric & Manufacturing Co.; **Stanley E. Jeppesen,** recent graduate of the University of Idaho; and **Orin D. Cunningham,** formerly of the Reilly Laboratories, Indianapolis, Ind.

The following have recently been added to the chemical staff of the Edwal Laboratories, Inc., Chicago, Ill.: **James W. Watters,** previously with the U. S. Food and Drug Administration; **Richard I. Jackson,** previously with Trinity University, Waxahacie, Tex.; and **Eurilla Herrin,** 1942 graduate of the Central Y. M. C. A. College of Chicago.

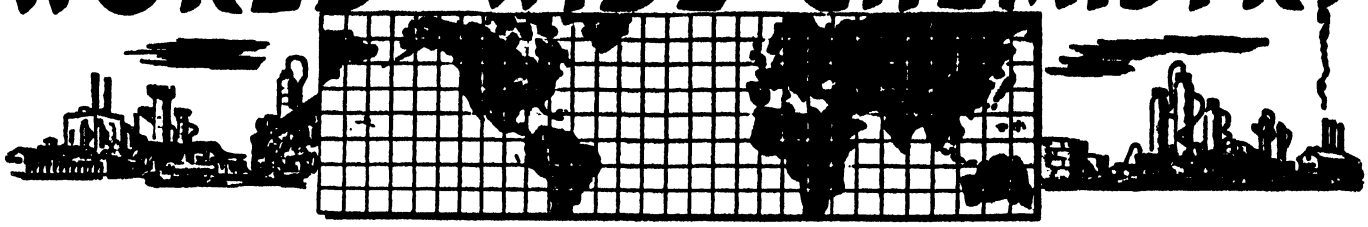
Bloede Scholarship Awarded

TO FREDERICK G. SAWYER, a candidate for the Ph.D. degree in the Department of Chemical Engineering at the Polytechnic Institute of Brooklyn, goes the Bloede Scholarship for 1942–43. This award, founded by the late Victor G. Bloede in 1916, is awarded by The Chemists' Club, New York, in alternate years and carries a stipend of $580. Mr. Sawyer received the B.Ch.E. and M.Ch.E. degrees from the institute in 1939 and 1941.

The Hoffmann scholarship, also awarded by The Chemists' Club, has been held by Robert T. Olsen during 1941–42. Mr. Olsen expects to complete work for the Ph.D. degree at Massachusetts Institute of Technology in the Department of Chemistry this fall and will take a position in industry.

Armour Research Foundation Increases Staff

ADDITIONS to the staff of the Chemical Engineering Section, Armour Research Foundation, Chicago, are **John M. MacGregor,** formerly with the Division of Soils, University of Minnesota; **Ibert Mellan,** author of "Industrial Solvents" and "Organic Reagents in Inorganic Analysis"; **E. L. Hill,** recently head of the Department of Chemistry, Carthage College; and **Francis J. Frere,** formerly with the Standard Oil Development Co. of Elizabeth, N. J. Dr. Frere will direct the foundation's analytical laboratory.



Belgium Tests Fertilizers for Sugar-Beet Cultivation

A MIXED fertilizer in the form of chlorides has emerged as the most satisfactory in sugar-beet cultivation during aseries of tests, conducted in Belgium in the past five years, on mixed fertilizers containing potassium and sodium salts.

Use of sodium chloride alone or of sodium carbonate or sodium sulfate alone, or combined with potash, did not give as good results, it was said, in either sugar content of the beet or the total sugar yield. Soda in the mixed fertilizer tended to increase resistance of the beet to disease, without harmful effect on the soil.

Further tests have indicated that simultaneous application of sodium and potassium compounds in the form of pure salts results in a 12 per cent increased sugar yield, compared with a 7 per cent increase from potash alone. Soda is particularly beneficial in light, sandy soil. Fertilizers containing soda are recommended in the report for sugar-beet districts where leaf yellowing disease is prevalent.

WORLD-WIDE CHEMISTRY

Continental Europe

Germany

Germany's production of potassic and nitrogenous fertilizers normally exceeds local requirements, and such difficulties as have been encountered by farmers in Germany in obtaining these chemical fertilizers were caused mostly by shortcomings in transportation. It is reported that the bulk of demand for potassic and nitrogenous fertilizers has been covered regularly, but the supply of phosphatic fertilizers has been far below demands. Several superphosphate factories in the eastern provinces have been closed down, while consumers in western Germany seem to rely mainly on basic slag from blast furnaces in the Rhineland and Belgium. The lack of phosphatic fertilizers has been felt most severely by sugar-beet growers. Before the war Germany used to import more than 1,000,000 tons of rock phosphates and 400,000 tons of basic slag, and only a small fraction of this tonnage can be obtained today. The fertilizer position in the occupied territories in the east is especially bad, although recently efforts have been made to draw on supplies from local factories where war damages have been repaired.

Recovery of Chemicals in Cellwool Industry Increased

The big expansion of the cellwool industry since the beginning of the war has greatly increased the demand for heavy chemicals. It is reported that the industry now absorbs about 400,000 tons of sulfuric acid and 360,000 tons of sodium hydroxide a year. These chemicals are recovered by continuous electrolytic decomposition from the waste Glauber salt in the spinning baths, of which about 300,000 tons are said to be obtained every year. The chief difficulty in the development of this process was the discovery of a suitable construction material for the plant, as corrosion-resistant alloy steel is in short supply. A process, economical from the viewpoint of apparatus, for the partial recovery of sulfuric acid and sodium hydroxide is reported to be available and to yield the materials in sufficiently high concentration and purity.

Some progress is also said to have been made in the recovery of carbon disulfide, of which about 140,000 tons are used every year. Over 40 per cent of the material is recovered, partly from the spinning baths and partly from the cellwool fiber to which it adheres and from which it is recovered by steam distillation followed by condensation. The resulting saving in imported sulfur is said to be 60,000 tons annually. Disposal of the poisonous waste gases has become much more difficult with increased production. These are now usually carried by ventilators through earthenware pipes to the boiler plant where the sulfurous contents burn to sulfur dioxide without damaging the boiler tubes. It is admitted that other methods of disposal, e. g., recovery in absorption towers or oxidation with ozone or chlorine, would yield valuable by-products, but these alternative methods have been found to be too expensive considering the lack of a suitable outlet for the materials obtained.

Hemicelluloses from Cellwool Factories are to Be Developed

Much attention is being paid to the hemicelluloses which must be eliminated from cellulose material and are usually removed by preparatory hydrolysis, a process which consists of the treatment of wood, straw, and other cellulose materials with a weak acid solution under pressure. It yields a superior kind of cellulose for cellwool manufacture. The hemicelluloses contain xylose, mannose, galactose, and glucose. Xylose is obtained from straw and deciduous trees; coniferous trees yield about 50 per cent of mannose. Furfural for the lacquer and plastics industry can be produced from the xylose, but more interest seems to be given to the manufacture of yeast and protein products. Pentosans obtained by hydrolysis are carefully purified and, after addition of phosphate and ammonium salts, yield on fermentation with *Torula utilis* in a strong air current a yeast rich in vitamin B. Nothing is known about the extent to which industrial use is made of the hemicelluloses at present, but it is claimed that one cellwool factory alone would be able to produce 20,000 tons of yeast with 10,000 tons of protein. Compared with other processes for the biological protein synthesis from cellulose-containing materials after hydrolysis, this method is said to have the advantage of mild operating conditions resulting only in a partial saccharification which leaves the cellulose available for other purposes.

Nitrogenous Fertilizers Raise Protein Content of Cereals

Experiments on increasing the protein contents of cereals have shown that satisfactory results can be obtained with summer and winter barley, oats, and summer and winter wheat, if nitrogenous fertilizers are applied after the corn has eared. These doses are additional to the fertilizers applied before sowing and consist preferably of nitrates. A granular type like nitrate of lime and ammonia, applied immediately after rains, is said to be most suitable. Increases in protein yields by 20 to 50 per cent per acre are claimed to have been obtained by application of additional doses of nitrogenous fertilizers at a cost of 0.20 to 0.30 mark per kilogram of protein. Not only the ears but the straw showed higher protein content, it is reported, so that the feeding value of the straw was increased.

Perlon Fiber in Commercial Production

Perlon fiber, the new fully synthetic fiber developed by I. G. Farbenindustrie, is reported to be in commercial production and available for special purposes where strength is important. For civilian use Perlon fiber will be supplied at first for such articles as shoe laces and toes and heels of socks and stockings. The larger part of the output will be used for industrial and military purposes.

Superpolyamides May Be Used as Leather Substitute

Several grades of Igamid, the I. G. Farbenindustrie brand of superpolyamides, have been studied for possible use in the leather industry. As these mate-

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

rials have a strength superior to sleeked leather and can be sewn without danger of tearing, they can be used in the same way as most kinds of leather for bags and cases. It is reported that preparations are now under way for the use of Igamid as sole leather. The output, however, is not large enough to replace a substantial part of the leather normally used, and work on other substitutes continues.

Sodium Cellulose Glycolate Substitutes for Agar-Agar

Among substitutes of gum arabic, agar-agar, and tragacanth is sodium cellulose glycolate, made in Germany by six manufacturers who offer about 40 different preparations. Some of these are used for sizing and dressing in the textile industry, others serve as emulsifiers, binding agents in the paint industry, adhesives, etc. It is expected that suitable grades will shortly be available for use in the food industry.

Peat Coke and Peat Tar Prove Useful in Laboratory Experiments

The coal shortage has focused attention on local deposits of peat in various countries of Europe as a fuel material, not only in stationary ovens and furnaces but for mobile gas producer plants. Little attention, however, has so far been paid to its chemical utilization, mainly because of its unsatisfactory physical condition, high water content, and consequent difficulty of handling. In laboratory experiments it was found that a treatment preparatory to carbonization may give satisfactory results. It consisted of the removal of gross impurities and a simple breaking up of the material, followed by mechanical breaking and partial dehydration by pressure or similar means. The product obtained contains 60 to 70 per cent of water and is very plastic. It must be dried without further application of pressure and yields, when carbonized, a very firm coke. Peat cokes obtained by other processes were unsatisfactory because they were prone to disintegrate. The good mechanical properties of this peat coke, its high reactivity and calorific value (7,500 kg.-cal.), low ash content, and absence of sulfur are expected to ensure a satisfactory demand for the material in metallurgy and gas production.

The peat tar obtained by carbonization was found to contain surprisingly little nitrogen. While dried peat contains an average of 36 to 37 per cent of nitrogen, peat tar contains only 7 per cent, as most of the nitrogen enters the carbonization water and gas. Low-temperature carbonization peat was found to be similar in chemical composition to lignite low-temperature carbonization tar, so that it is thought it may prove of interest for hydrogenation. The distillation of peat tar proved most successful when applied with overheated steam and yielded 7.5 per cent of motor spirit distilling below 200° C.; 23.3 per cent of gas oil, between 200° and 350° C.; and 20 per cent of heavy oil, above 350° C. The remainder consisted of 15 per cent of crude paraffins 13.2 per cent of phenols, 3.8 per cent of fatty acids, and 3 per cent of basic constituents—all recovered by various treatments. Neither the motor spirit nor the gas oil, however, is regarded as satisfactory in quality for use in motor engines, although they may be improved by further treatment. Similarly it is believed that the higher distillates of peat tar may yield heavy oils for use in the manufacture of lubricants.

New Methods Developed in Raffination of Benzene

In the raffination of crude benzene, the previous process employing concentrated sulfuric acid of 66° Bé. has been partly abandoned in favor of a selective elimination of diolefins, etc., by use of sulfuric acid of about 60° Bé. or by heating with alkali of benzene washed in diluted acid. This method has the advantage of leaving valuable olefins and unsaturated hydrocarbons in the motor benzene and reducing the loss by washing from 10 or 15 per cent to 5 per cent. The disadvantage is that after prolonged storage the benzene yellows and precipitates resins. To overcome this drawback, the crude benzene is separated by distillation into two fractions, below 135° C. distillation point and 135° to 180° C. The first one only is treated with sulfuric acid of 60° Bé. at 25° to 40° C., while the second fraction is washed with 66° Bé. After neutralization the two fractions are mixed and, although the total loss is only 6 per cent, the content of resinous material is below 1 gram per 10,000 cc.

Separation of crude benzene into two fractions to be treated by different processes is also the solution for production of a motor fuel with a sufficiently high antiknock value from the kerosene fraction of mineral oils. If the latter is blended with benzene, an inclination towards knocking persists because the mixture is highly volatile and of varied composition. It was found to be unsuitable for certain engines. However, the crude benzene can be separated into two fractions, distilling below and above 160° C. The former is refined with sulfuric acid; the latter is subjected to pressure hydrogenation in such a way that impurities (sulfur and oxygen compounds) are eliminated and the other contents are left unaffected. Restriction of pressure hydrogenation to one fraction is said to ensure without great loss in quantity a high yield especially of hydrocarbons distilling at higher temperatures.

New Asbestos Source Reported Opened in Norway

Only small deposits of asbestos minerals are known to exist in Continental Europe, and German supplies are at present limited to small quantities produced in Italy, Czecho-Slovakia, and Finland. A new source is reported to have been opened in Norway, where serpentine has been known to be available for considerable time. No information is available regarding the material, mining of which has now commenced, but the "stone wool" now mined there seems to be a material closely related to asbestos.

Sweden

Ragnar Windbladh, director of the chemical section of the Swedish Industrial Commission, has stated that Sweden's important requirements of chemical raw materials, including those for the rubber industry, normally amounted to 280,000,000 kronor, i. e., more than 60 per cent of production. Since the beginning of the war great efforts have been made to extend the raw material basis of the Swedish chemical industry. Production of sulfuric acid has been increased, and is now sufficient to meet the country's demand. Zinc salts, chromic acid, chromium salts, potassium permanganate, and certain phosphates are being made in Sweden. Output of sodium sulfate, nitric acid, and hydrochloric acid has been greatly enlarged. The big requirements of the cellulose industry have also stimulated electrochemical production. Larger tonnages of chlorine are being produced, and the manufacture of organic chlorine products has also increased.

Two basic industries which have made great progress in Sweden in recent years are wood distillation and mining. The former has been stimulated by the enlarged demands for charcoal for iron smelting and mobile gas producer plant, while the latter has been extended in various directions. Hitherto undeveloped deposits of copper and other metals are being opened up, and sulfur production is likely to be raised as a result of larger supplies from the mining industry.

Swedish Shale Oil Production Expanding

The shale oil plant at Kinnekulle, operated by a 10,000,000 kronor company in which the Swedish Navy is interested, has been in full production for one year. It is said that experience during this time has been fully satisfactory. The shale can be used almost completely as a fuel, and the by-products are utilized with a view to reducing the cost of production to be borne by the shale oil. A sulfur plant is now producing large quantities of sulfur

of very high quality for which the cellulose industry offers a ready outlet. Several new furnaces will be put into operation in the near future to increase the output of shale oil. Large-scale experiments on the treatment of the shale oil have been carried out with good results.

In the meantime progress is also being made with other shale oil plants. The big works at Närke began operations a few months ago, and a plant for the utilization of by-products is being installed. Fredrik Ljungström, who has developed a new process for the extraction of shale oil, received a government grant of 1,200,000 kronor to build an experimental plant at Ekeby where it is intended to treat 2,500 tons of shale a day. Stocks for this new pilot plant have been accumulated in recent months. The works at Ekeby is expected to produce 85 per cent of fuel oil and 15 per cent of a crude oil, which will probably be sent to one of the Swedish mineral oil refineries for further treatment. Experiments have also been made with a view to the use of peat as a fuel for shale distillation.

Small-Scale Mining of Fluorspar Started

Aktiebolaget Brantevíks Gruvor, a company formed not so long ago, has begun mining fluorspar on a small scale. The material is to be used for the manufacture of light metals in a plant at Sundsvall.

Fodder Cellulose Mixed with Reed and Pine Needles

Production of fodder cellulose has made great progress in Sweden as a result of difficulties in importing overseas feeding stuffs and in disposing of cellulose for paper and textile factories. Several more plants have been equipped with machinery for the chemical treatment of cellulose for use as a fodder, and mixed feeding materials have been brought on the market. One of these contains needles of pine trees in addition to fodder cellulose prepared from wood and is given to horses, while another one includes reeds cut into small pieces and is recommended for cattle feeding.

Belgium

Société Anonyme Le Lanital Belge has built a factory for the production of 4 tons daily of casein wool, but it is doubtful whether the plant will be put into operation during the war. The Belgian milk output is needed entirely for feeding the population, and efforts to import casein from other countries have been unsuccessful. The plant capacity can be easily doubled, as provision for a later extension was made when building operations started, but at present it is not expected that use will be made of this possibility.

Denmark

Experiments on the production of alcohol from sugar beets have been carried out by the distillery at Hobro with such satisfactory results that the distillation of sugar beets is to be carried out on a commercial scale this year. It is said that the use of sugar beets is both cheaper and easier than that of potatoes which were formerly used at Hobro. The residues can be used as a feeding material.

France

Compagnie Centrale d'Hydrogenation et de Synthèse has been formed in Paris with a capital of 80,000,000 francs. Prominent among the founders are Banque de Paris et des Pays Bas and Compagnie des Mines de Béthune, the coal mining company which has been operating a hydrogenation plant for several years. The French Minister of Finance has been authorized to take over up to 30 per cent of the shares of the new company, and the government is actively interested in the work of the new company. The first plant will be built at Aix-en-Provence in the Fuveau basin where large deposits of lignite are available. Lignite seems to be the only raw material which will be used at first, but the location of the plant near the Mediterranean should make utilization of mineral oil residues possible should this be desired after the end of the war. The capacity of the new plant will be 25,000 tons of synthetic gasoline and 25,000 tons of methanol a year. The plans are to be drawn up in such a way that the plant can be doubled later. The company has also been authorized to build other plants elsewhere. The process to be used is an adaptation to lignite of the Fischer-Tropsch process and has been developed in France.

The new enterprise is not the only one undertaken in France in recent years. Though there is only one hydrogenation plant based on coal, that of the Compagnie des Mines de Béthune, several projects for the synthetic production of oil from lignite, shale, and oil residues had been worked out before the war, and some of these are to be put into effect now, although in different form. Plans for the establishment of lignite hydrogenation plants in the Départements of Landes and Bouches du Rhône have been announced by the Société de Combustibles et Carburants Nationaux, and the work on a shale distillation plant at Autun has made progress. All these projects suffer, however, from the difficulty of obtaining equipment and materials. Construction work on the new plant of the Compagnie Centrale d'Hydrogenation et de Synthèse is scheduled to last three years.

Switzerland

Following a government decision, Holzverzuckerungs A.-G. of Ems, Graubünden, is preparing for the production of 2,000 tons a year of yeast by the saccharification of wood. The yeast will be used in connection with domestic feeding materials with a view to the replacement of imported feeding stuffs which are now unable to meet the supply.

Swiss Chemical Industry Faces Wartime Problems

Swiss producers of fine chemicals, pharmaceutical preparations, and synthetic dyestuffs report that the export problem has greatly increased of late. Trade with other countries of Continental Europe is governed by clearing and compensation agreements which are generally considered satisfactory as far as the technique of the transfer of payments is concerned, but as it becomes increasingly difficult to replace raw materials used up in manufacture, Swiss chemical manufacturers have in some cases stipulated that the foreign buyer should supply them in return with the raw materials required for their products. Other means to overcome wartime difficulties have been replacement of imported raw materials by domestic ones, changes in manufacturing processes, and introduction of entirely new products. Much ingenuity seems to have been displayed by the leading firms, but great difficulties had to be overcome in the beginning, and it is feared that even greater obstacles will be encountered in the near future. Cooperation in the Swiss dyestuffs industry has made progress as a result of recent changes. It is hoped that in future many intermediates which had to be imported will be made in Switzerland, and research in this direction has been undertaken and shows good results. In overseas markets strong foreign competition was noticed at times. The absence of high-class products has compelled foreign consumers to take what was offered to them, and it is feared that this may have adverse effects on Swiss exports of high-class chemicals and dyestuffs even after the war.

Italy

Istituto per la Riconstruzioni Industriale, the government-owned company originally formed to put Italian banking on a sound basis, has taken a considerable interest in the production of synthetic rubber. Two companies were formed for this purpose jointly with the rubber manufacturing combine Pirelli, and it is reported that the first of these is in a position to begin production. This company is Societa Anonima Industria Gomma Sintetica which has built a plant

capable of an annual production of 6,000 tons of synthetic rubber at Ferrara. The raw material to be used is alcohol. The other IRI subsidiary to engage in synthetic rubber production is Societa per la Produzione della Gomma Sintetica, which is building a factory with a capacity of 12,000 tons a year at Terni for the utilization of lignite by a German process. This plant will not be ready for production before next year. Istituto per la Ricostruzioni Industriale is also interested in the Italian cellulose industry and is cooperating with the paper company Burgo in the erection of several new cellulose factories.

Another Italian company is going to build a plant for the treatment of guayule at Cerignola. Guayule has been planted on an area of 17,500 acres in the province of Apulia. The plant will not be completed until 1944.

Eastern Europe

While some chemical factories in the occupied eastern territories have been taken over by German private companies, in general German policy has been to establish new companies for the management of chemical enterprises in Poland and other countries under the temporary control of the German Army. These companies are divided into two groups—Betreuungsgesellschaften (trust companies) and Betriebsgesellschaften (operating companies). The latter group includes Baltische Oel A. G., Ostöl G. m. b. H., Berg- und Hüttenwerksgesellschaft Ost m. b. H., and Ostfaser G. m. b. H. These firms are concerned with exploitation of local resources of shale oil, mineral oils, minerals, and fibers. The group of trust companies includes Soda- und Aetzalkalien-Ostgesellschaft, Chemie-Ostgesellschaft, Stickstoff-Ostgesellschaft, Superphosphat-Ostgesellschaft, and Seifen- und Waschmittel-Ostgesellschaft. These companies are concerned with the operation of entire industries—soda and caustic alkalies, chemicals, nitrogen compounds, superphosphates, and soaps and washing agents. Their function is mainly to supervise factories in their respective industries and to ensure supplies for the local worker.

Modern Mica Plant Proposed for Bulgaria

A modern plant for the utilization of mica is being erected by German interests in the Prilep district of Macedonia. When completed, it will employ 1,500 men in the mining and treatment of the material which was formerly exploited by primitive methods.

Chile Exports Bark of Quillay Tree to U. S.

The United States is the heaviest foreign purchaser of Chile's soap bark, quillay, which is produced principally in that country. Exports to the United States rose in 1941 to 982.3 tons, compared with 733.3 metric tons the year before. United States imports of this article from Chile were only 120.2 tons for January and February of this year, however, compared with 191.5 tons for the same two months of 1941.

The quillay tree grows wild at an elevation of 2,000 feet on Chile's mountains, its bark rich in saponin. The product has many uses, serving in medicine as a detergent or cleansing agent and as an expectorant in early stages of bronchitis. Industrially it is used as an emulsifying agent in shampoos, ointments, balsams and resins, cosmetic preparations, and fire extinguishers and for producing foam on nonalcoholic carbonated beverages.

The Chilean Government treats the product as a monopoly, requiring written license to export and establishing standards for classifying the product. Owing to laxity in the past and destructive methods of stripping bark, it is estimated more than 250,000 trees are destroyed annually. In spite of various experiments, efforts at propagation of trees from the seeds have never succeeded.

Mexican Lime Oil Plants to Operate at Capacity

Lime oil manufacturing plants in Mexico will operate to capacity this season, it is reported. Substantially increased production of limes, with rising prices stimulating the manufacture of lime oil, have been forecast for the 1942 season in earlier reports. Lime-oil output in the current year is expected to exceed the 1941 figure of 110,000 pounds.

Some changes noted in the current outlook over previous seasons include a new railroad tapping the area south from Uruapan, in Michoacan, expected to save much fruit previously damaged by rough transit. The Colima area is expected to have a larger crop this year because of additional trees coming into bearing, also the recurrence of the fruit-bearing cycle this season. A 25 per cent increase may result.

Should a shortage of packing materials occur, it may cause a drop in exports, but the factories may have difficulty in handling all supplies received for extraction of oil.

Egypt's wheat crop took an estimated 80,000 tons of nitrate in 1942, although some reservations are reported as to how much went for wheat, and whether any was used for barley or reserved for the later cotton crop. It is generally believed that farmyard manure was widely used this year.

Government of India Promises to Protect Postwar Chemical Industry

Rapid growth is reported for India's chemical industry, and the government has given assurances that this will be protected after the war. Not only are old factories expanding, but new ones are appearing, producing chemicals for war needs and commerce. There has been an increased production of toluene and nitric acid for explosives and a large output of naphthalene, glycerol, copper sulfate, aluminum sulfate, magnesium sulfate, zinc chloride, and alum, with sodium and potassium dichromates being manufactured on a smaller scale.

Under local industrialization programs sulfuric acid, sulfates, glucose, starch, casein, and plastics are also to be made. The manufacture of chemicals as by-products of nonchemical plants has developed. In Bengal, for instance, a new steel center is supplying considerable amounts of ammonia, benzene, and tar.

Development of Industries in Iraq under Consideration

Belief is current, it is reported, that Iraq will be a center of many industries, products of which will be used for domestic requirements as well as for export to the Near and Middle East countries. The need is for industries manufacturing cement, paper, glassware, burlap sacks, matches, beer, leather, hosiery, cotton textiles, window glass, toilet soap, and finished bandages. There was under consideration late in the past year the organization of industrial units to produce such articles.

Ireland Plans to Produce Superphosphates Locally

The prospect that Ireland may derive from domestic mining operations at least a fourth of the quantity of superphosphates normally used in the country is reported. Work has been started in County Wicklow on the mining of iron pyrites for producing sulfuric acid, under direction of the Mineral Exploration and Development Co. Together with the output from County Clare phosphate deposits, it is hoped that a portion of domestic requirements will result from such sources.

Mexican Phenol Needs Supplied by Imports

Mexican consumption of phenol approximates 10,100 kg. annually and is supplied by imports, formerly from the United States, Germany, and the Netherlands. Imports have ranged from a low of 5,540 kg. in 1940 to 10,716 during 1935, with 1941 figures at about the annual average. Phenol is used as an antiseptic, in the manufacture of picric acid, and by the plastic and paint industries.

POTOMAC POSTSCRIPTS

WPB Activities

Agar. To prevent any diversion of agar to nondefense purposes, the definition of the material in Conservation Order M-96 has been broadened to include wet as well as dry forms. This is accomplished by Amendment 1, which defines agar to mean "any mucilaginous substance, whether dried or in other form . . . . . ."

Antimalarial Agents. Because large amounts of antimalarial agents will be needed by our armed forces fighting in the tropics, WPB has taken two actions designed to prevent the use of stocks of any such drugs for nonessential purposes. An amendment to Conservation Order M-131 revokes the provision which exempted quinine or totaquine stocks of less than 50 ounces from sales restrictions of the order. A new order, M-131-a, prohibits the sale of any amount of cinchonine or cinchonidine for other than antimalarial purposes, or the sale of quinidine except for antimalarial purposes or treatment of cardiac disorders. All three of these substances are derived from cinchona bark, which this country normally obtains from Java. The United States is now dependent on the stock pile of quinine which had been built up before we entered the war and on the small amounts of bark which we may be able to procure from South America. The existing supply of the three drugs is not definitely known. Production was quite small when quinine was generally available for all purposes, but has recently increased. The present demand for them as antimalarial agents has been slight, but is expected to increase as reserve supplies of quinine are diminished.

Butadiene, basic ingredient for the manufacture of Buna-type synthetic rubber, is placed under allocation in Order M-178. Producers seeking to deliver and persons asking delivery of butadiene are required to make application to the Director of Industry Operations, Reference M-178. They are requested to use Form PD-33, which covers the production and shipment of all chemicals used in the manufacture of synthetic rubber. Producers who make less than 5 tons of butadiene per month are excepted from provisions of the order.

Chrome Chemicals. Restrictions on the use of chrome chemicals, particularly in the manufacture of pigments and printing inks, have been eased. Revisions were made in Orders M-18-b, covering various uses of chrome chemicals, and M-53, which relates to the use of chrome pigments in printing inks. The orders cover chrome chemicals only and have no bearing on metallurgical or refractory grades of chromium. Approximately 12 per cent of the total chromium supply is used for chemicals, of grades not adaptable for other uses.

M-18-b lifts the restriction on the manufacture of chrome pigments from 90 per cent of the base period, the year ending June 30, 1941, to 100 per cent. Use of chrome chemicals in the manufacture of ceramics, soap, and glass, heretofore prohibited, is limited to 100 per cent of the base period. In roofing materials, also prohibited by the original order, 50 per cent of the base period use may be consumed. For leather tanning the restriction is upped from 90 to 100 per cent. M-53 permits the use of chrome pigments in printing inks of 100 per cent of the amount used in 1941, instead of 70 per cent.

Coal and Coke. Chemical producers are permitted to build up inventories of coal and coke by Amendment 2 to Preference Rating Order P-89. The action is part of a nation-wide drive to encourage accumulation of fuel stocks in anticipation of shortages expected to be caused next winter by war demands on transportation facilities. Amendment 2 also makes the order and all amendments to the order effective until revoked. The previous amendment was to have expired on June 30.

Coatings. To enable steel drum manufacturers to use some 150,000 gallons of exterior drum coating that they have on hand, the use of which was forbidden by Conservation Order M-158, an amendment to the order has been issued. The amendment also limits application of the order to drums made of 29 gage or heavier steel, the intention being to exclude from the order such containers as tin cans.

Use of pigmented coatings of any color on either or both ends of drums or upon the sides, where required by Government or underwriters' regulations, and the use of clear as well as black coatings are permitted without restriction. These drum coatings are suitable for no other purpose, the materials in them are not reclaimable, and it is felt that further restrictions on existing stocks would serve no useful purpose.

Ethyl Cellulose is placed under complete allocation control by General Preference Order M-175. By the terms of the order, no person may deliver and no person may accept delivery of ethyl cellulose except by specific authorization of the Director of Industry Operations. Deliveries of 50 pounds by any one person to any one other person in one month are excepted. While production is now larger than ever before, orders carrying preference ratings of A-10 or higher are drawing off stocks for which comparatively plentiful nitrocotton, pitch, tar, or other substitutes are available. This order is issued to prevent use of ethyl cellulose in places where substitutes are adequate.

Plastics. The growing importance of plastics in the war effort is reflected by the action of the Director of Industry Operations in taking control of the distribution of thermoplastics. All other types of plastics already are under various types of control. Order M-154 sets up a ladder of uses to govern distribution of all types of thermoplastics to all users.

War orders are to be filled first and without restrictions, then Class I orders to the extent available. The remaining available supply is to be used to fill Class II orders up to 50 per cent. Any residual supply over 50 per cent is to be divided equally between unfilled Class II orders and Class III orders. Until September 1, Class IV will be considered a part of Class III. After that date the use of thermoplastics in the manufacture of articles in Class IV will be prohibited. The divisions are:

Class I—Essential equipment for transportation, communications, industrial plants and offices, health supplies, food production and distribution, technical and safety uses, and housing.
Class II—Commercial equipment, school and educational supplies, automobile and bicycle parts, household appliances, and essential personal items.
Class III—Less essential commercial, household, and personal items.
Class IV—Articles deemed primarily ornamental or nonessential.

The order covers thermoplastic synthetic resins and cellulose derivatives. Formaldehyde plastics and derivatives are covered by Order M-25 and plastics with elastic qualities are covered by Order M-10, which controls polyvinyl chloride and its derivatives.

Pyrethrum goes under complete allocation and end use control by General Preference Order M-179. The order provides that no pyrethrum may be delivered without express authorization of the Director of Industry Operations. He also may direct the use to which pyrethrum may be put. Rotenone was formerly the chief raw material used in insecticides, but since it was put under allocation by Conservation Order M-133, greater demands have been made on pyrethrum as a substitute. All United States supplies of pyrethrum are imported.

Solvents and Oils. Millions of gallons of valuable chemical solvents and oils which are now being discarded can be reclaimed for further production purposes, according to S. Donald Perlman, salvage director for the chemical and textile indus-

tries, Industrial Salvage Section of the Bureau of Industrial Conservation. Contacts and conferences with business firms engaged in the reclamation and recovery of commercial solvents, said Mr. Perlman, indicate that they have facilities available for increasing by 50 to 75 per cent the amount of solvent reclamation now going on in the country. The same chemicals that are used for solvents are also employed directly or indirectly in the manufacture of munitions and other war material, he pointed out. The principal types of solvents that can be reclaimed are alcohols, chlorinated compounds, esters, ethers, hydrocarbons, and ketones.

An educational campaign has been initiated by the Bureau of Industrial Conservation to make sure that all users of solvents take advantage of the facilities available for reclaiming and recovering them. Recovery of solvents means condensing vaporized solvents as part of the original manufacturing process. About a billion pounds a year are now being saved in this way, stated Mr. Perlman. Reclamation of solvents, on the other hand, he pointed out, means hauling away the sludge and contaminated contents of vats and putting them through a special reclaiming process. Clean chemicals may be obtained by such operations as distilling, centrifuging, filtering, washing, or decanting.

There is an economy side to the picture of reclaiming solvents as well as the presently vital factor of conserving them for war production, Mr. Perlman explained. A solvent that costs 20 cents a gallon, for example, may often be reclaimed for as little as 2 cents a gallon and used again.

Tinplate and Terneplate. Manufacture or use of tinplate or terneplate cans for many chemicals, paints, and other special products is prohibited in a revision of Conservation Order M-81. Among the special products for which tinplate or terneplate cans are not permitted are the following:

All paint and related products. An exception is made in the case of shellac, lacquers, varnish removers, lacquer thinners, and lacquer stains, which may use terneplate but not tinplate cans.

Health supplies except chloroform, ether, and blood plasma for the Armed Services or the Red Cross.

Alcohol; cements, including rubber, linoleum, and radiator; fly spray; lighter fluids; acetone; amyl acetate; oleic acid; sodium silicate; dry cleaners; turpentine; phenols and benzene; and glycerol.

Dyes; graphite; liquid soap; glues and paste; waxes; and polish.

The revision also prohibits the packing in tinplate or terneplate after October 31 of hardened edible oils, hardened or unhardened lard, edible liquid oils, fish filets, crab meat, and shrimp.

The revised order, according to Containers Branch officials, will result in an annual saving of an additional 450 tons of tin. It had been computed that the original M-81 order would reduce annual consumption of tin for cans to 18,000 tons, compared with 40,000 tons used for the same purposes in 1941.

Price Regulations

Antifreezes. American motorists will be able to obtain antifreeze at reasonable levels during the coming winter, Leon Henderson, Price Administrator, has stated in announcing maximum prices for this commodity. The retail price has been established at levels well under the speculative quotations prevalent at the end of last winter, he said. The dollars and cents maximums were established by Maximum Price Regulation 170. The maximum price for permanent antifreeze is the price which prevailed in the month during the six-month period ended March 31, 1942, in which the individual seller sold the greatest amount of antifreeze. In no event, however, may the retail price be higher than $2.65 per gallon or 70 cents a quart.

Magnesite. To ensure an adequate supply of maintenance grade dead-burned grain magnesite for the Vanadium Corp. of America and the Mathieson Alkali Works, Price Administrator Leon Henderson has granted permission to the Westvaco Chlorine Products Corp. to increase its selling price for this commodity to $40.50 per ton in sales to these two consumers. The change in the maximum price, which applies only to these two customers and to shipments from Westvaco's Patterson, Calif., plant, was effected by Amendment 2 to Revised Price Schedule 75.

Under Revised Price Schedule 75 the maximum price for the maintenance grades of domestic dead-burned grain magnesite was established at $22 per ton, f. o. b. cars Chewelah, Wash. However, in recognition of high-cost war production, Westvaco was granted permission to charge a maximum of $32 per ton, f. o. b. cars, Chewelah, Wash., to its regular customers in California. Mr. Henderson explained that, since the present price of $40.50 per ton applies f. o. b. cars, Patterson, Calif., Westvaco will only secure the same realization on sales to Vanadium and Mathieson as previously secured on sales to California steel mills.

Before the war, the United States imported large quantities of dead-burned magnesite. The shutting off of imports, combined with a large demand from war industries, has resulted in demand exceeding supply and has necessitated some high-cost production.

Naval Stores. Wood and gum for naval stores and gum naval stores are excepted from the General Maximum Price Regulation in Amendment 5 to the regulation. Wood naval stores, including pine oil, however, remain under provisions of the General Maximum Price Regulation at all levels of distribution, from manufacturer's distillation to retail. Gum naval stores are excepted from the regulation by Subparagraph 14 of Section 9A of the General Maximum Price Regulation. It has now been determined that gum naval stores are agricultural commodities within the meaning of Section 3 of the Emergency Price Control Act of 1942. Present prices for gum naval stores are lower than the maximums which could be set under Section 3. Wood naval stores, on the contrary, is a heavy industry, with the country's entire output being accounted for by 10 plants. Products of such establishments clearly are industrial commodities, according to OPA.

Synthetic Rubber, Aviation Gasoline, Toluene, and materials essential to their manufacture have been removed from under price ceilings to spur industrial expansion deemed necessary for an increasing volume of these vital war necessities. The action came in Amendment 7 to Supplementary Regulation 1 to the General Maximum Price Regulation, and Amendment 18 to Revised Price Schedule 88, covering petroleum and petroleum products.

Specifically, these amendments except from price regulation:

1. Aviation gasoline of 91-octane rating or higher,
2. Basic materials and components used in its manufacture,
3. Synthetic rubber, including rubber of the butadiene-styrene copolymer, Perbunan, neoprene, Thiokol, butyl, Koroseal, flammenol, and acrysol types,
4. Basic materials and components used in such manufacture,
5. Toluene manufactured from petroleum,
6. Base stocks from which toluene is produced.

These amendments were made after other government agencies had asked for the exemptions to further increased production of the commodities. The price ceilings are removed, Price Administrator Henderson explained, to permit complete price flexibility during the formative stages of industry expansion to meet critical wartime demands.

Zinc Oxides. The maximum price for leaded zinc oxides containing 35 per cent or more lead, which was reduced 1/4 cent per pound by the General Maximum Price Regulation, has been allowed to return to the April 1, 1942, level of 7 cents per pound. This price, which corrects an inadvertent omission, became effective June 22.

Chemical Companies Indicted under Antitrust Laws

INDICTMENTS charging violation of the antitrust laws have been returned by a Federal Grand Jury against a number of chemical companies, the U. S. Department of Justice has announced.

One indictment charges that the defendants have for a period of over eight years conspired to raise chromic acid prices artificially and to fix and maintain such prices at noncompetitive levels throughout the United States. Companies indicted as engaged in the conspiracy are E. I. du Pont de Nemours & Co., Inc., Mutual Chemical Co. of America, Harshaw Chemical Co., and Martin Dennis Co. Eleven individuals were also named.

Another charge concerns an alleged conspiracy to fix, control, and stabilize the price of formic acid sold in the United States. The indictment also charges that the defendants have for a period of six years monopolized the sale of formic acid throughout the United States. Named in the indictment are E. I. du Pont de Nemours & Co., Inc., Victor Chemical Works, General Chemical Co., Innis, Speiden and Co., American Cyanamid and Chemical Corp., and 13 individuals.

Charges of violation of the antitrust laws in the manufacture, sale, and distribution of sulfuric acid were leveled against General Chemical Co., Monsanto Chemical Co., American Cyanamid and Chemical Corp., Dow Chemical Co., Standard Oil Co. of New Jersey, Prior Chemical Corp., E. I. du Pont de Nemours & Co., Inc., Davison Chemical Co., Atlas Powder Co., Mutual Chemical Co. of America, Pennsylvania Salt Manufacturing Co., Southern Agricultural Chemical Corp., F. S. Royster Guano Co., Stauffer Chemical Co., The New Jersey Zinc Sales Co., and 37 individuals.

A fourth indictment charges that the defendants have for a period of over nine years conspired to fix and maintain at noncompetitive levels the prices of bichromates of soda and potash sold throughout the United States. Named in the indictment are Mutual Chemical Co. of America, Prior Chemical Corp., Natural Products Refining Co., The Martin Dennis Co., and 10 individuals.

Four companies and 11 individuals have been indicted on charges of conspiring to stabilize the price of hydrochloric acid by studiously policing the supply of the acid for sale by entering into exchange agreements, by purchasing from each other for resale to others, by prevailing upon small producers to discontinue the acid production, and by using reciprocal relations and discriminations as a means of controlling its sale. The companies are E. I. du Pont de Nemours & Co., Inc., General Chemical Co., Monsanto Chemical Co., and Dow Chemical Co.

An indictment concerning the manufacture, sale, and distribution of oxalic acid charges that the defendants have for a period of years conspired to fix and control prices of oxalic acid by controlling the quantity of oxalic acid produced and the channels of distribution, establishing identical prices, and refraining from raiding each others' customers. A second count charges that the defendants conspired to monopolize the production of oxalic acid. The defendants are Victor Chemical Works, Mutual Chemical Co. of America, Oldbury Electro Chemical Co., General Chemical Co., and 14 individuals.

Additional Properties of Enemy-Owned Nationals Seized

AN ADDITIONAL group of more than 750 enemy-owned patents, among them about 200 patents of I. G. Farbenindustrie not previously vested, have been seized by the Office of the Alien Property Custodian. Included also were a number of patents owned by Japanese, Italian, and Hungarian corporations and individuals. The patents vary widely in nature, covering an automatic drill and riveter for use in aircraft construction, a conveyor already in wide use in this country in coal mines, certain processes in oil refining, and chemicals, including adrenalin compound and chlorinated rubber.

Other vesting orders included seizure of control of J. M. Lehmann Co., Inc., and Adlanco X-Ray Corp., both of New York. The Lehmann company, originally founded by a firm of the same name in Dresden, Germany, manufactures machinery used in the ink and paint industries. Adlanco X-Ray Corp. was a subsidiary of the huge Siemens electrical interests of Germany and acted as American agents for the distribution of Siemens x-ray equipment.

Stock control of the Nirosta Corp., New York, and of the Lingner Corp., Chicago, and five German copyrights and copyright claims, properties of German nationals, have also been taken over by the Custodian's office. The Nirosta Corp., known as Krupp-Nirosta until 1940, is engaged solely in administration and licensing of patents which it acquired from Friedrich Krupp, A.-G., of Essen, Germany. The patents relate to alloy and stainless steel. The Lingner Corp. succeeded by assignment to all trade-marks, patents, secret formulas, and manufacturing processes of Odol Chemical Co., all of which were owned originally by Lingnerwerke, A.-G., of Berlin, Germany.

Alien Property Custodian Requires Reports on Patents

ALL persons claiming any interest in patents or patent applications now or formerly owned by nationals of designated foreign countries are required by Leo T. Crowley, Alien Property Custodian, to report their interest, including any license agreement or claims of ownership, on Form APC-2 by August 15. Purposes of the order, Mr. Crowley said, are to locate and describe enemy-owned patents and interests in patents, to protect the rights of American citizens in foreign-owned patents and in patents which were once foreign owned, and to obtain information which will aid in administration of patents which are seized by the Alien Property Custodian.

For the purpose of the order a "designated foreign national" is a resident of any country other than the American Republics, the British Commonwealth of Nations, and the Union of Soviet Socialist Republics, and includes any person on the blocked list on June 1, 1942. Copies of Form APC-2 and instructions for reporting may be obtained on and after June 29 through offices of the Alien Property Custodian in Washington and Chicago. Completed and sworn reports are to be returned to the Alien Property Custodian, Washington, D. C.

Further provisions of the order require the filing of all agreements to which any resident of any foreign country, not only designated countries, is a party and which have been entered into by the reporter with respect to the patent reported, as well as a list of all United States residents whom the reporter, in turn, has licensed to operate under the patent or patent application reported.

A second order requires the reporting of change of address or citizenship by any person to whom a patent as yet unexpired was issued when the person was a resident of a designated foreign country. This information is required so that patent rights belonging to former residents of enemy countries who are now residents of this or an allied country will not be seized inadvertently by the Custodian.

Distillers to Convert to Industrial Alcohol

GRAIN liquor producers have been told by the War Production Board to convert their plants to the exclusive production of alcohol by November 1. The distillers were told their quota would be upward of 200,000,000 gallons annually. Their total present output of all spirits is about 600,000 monthly. Matthew J. MacNamara, special assistant director of the WPB Materials Division, said machinery and equipment for the conversion have been located and their use authorized. Payment for the shift from liquor to

industrial alcohol will be made by the Defense Plant Corporation. The change from light wines to alcohol, it was said, may be made gradually but must be made as rapidly as possible.

Sales of Liquefied Petroleum Gases Gain

AN UNUSUALLY active market for liquefied petroleum gases prevailing in 1939 and 1940 continued with increased momentum into 1941, when sales of 462,852,000 gallons were reported, a 48 per cent gain over the 1940 total of 313,456,000, according to the U. S. Bureau of Mines. The annual sales have quadrupled in five years, and the 1941 total for each of the several gases under review, with the exception of pentane, is above the combined total for all liquefied gases reported as recently as 1936.

All major demands for liquefied petroleum gases showed important gains in 1941 compared with 1940. Domestic requirements for cooking, water heating, and other household uses were 65 per cent above the 1940 level, compared with a 53 per cent expansion in 1940 over 1939. A 41 per cent increase in deliveries of liquefied petroleum gases for industrial fuel in 1941 compared with a 12 per cent increment in 1940 is largely the reflection of stepped-up war activities. Gains in sales of liquefied petroleum gases to manufactured-gas companies and to chemical manufacturers of 25 and 28 per cent, respectively, are slightly below comparative percentage increases shown for the same industries in 1940.

Chemical Manufacturers' Indexes

REVISED index of the value of chemical manufacturers' shipments for April was 173 compared with 176 in March and 151 in April of last year, taking an average month of 1939 at 100, according to the U. S. Department of Commerce. The department's figures also showed for April that the value of chemical manufacturers' inventories was 158.0 compared with 155.6 in March and 118.9 in April of last year.

High Priority Rating Awarded for Thiokol Plant

A HIGH priority rating will aid construction of facilities for the manufacture of Thiokol, the Dow substitute for rubber, officials of the War Production Board have announced. The new facilities will be a pilot plant capable of turning out only enough of the substitute material for retreading about 500,000 passenger car tires a year. This is about as many tires as now are being retreaded with reclaimed and natural rubber.

Limiting factor in Thiokol manufacture is said to be the supply of ethylene dichloride. If the pilot plant is a success, the supply of this basic raw material will be sufficient to permit manufacture of enough Thiokol to retread about 160,000 passenger car tires monthly. To increase Thiokol production beyond this amount, however, it would be necessary to expand facilities for making ethylene dichloride, and officials indicate that this amount of new construction probably would not be approved by WPB.

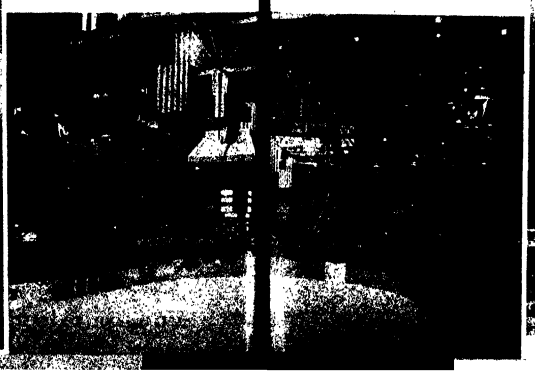
Thiokol, manufactured by Dow Chemical Co., Midland, Mich., for the Thiokol Corp., Trenton, N. J., has been made in relatively small amounts—between 500 and 1,000 tons per year—for use as a substitute for rubber, leather, and cork in hose, packing rings, washers, etc. WPB officials say it is not so good as natural rubber for tires, but tires that have been treated with it can be driven up to about 40 miles per hour for at least 5,000 miles.

WANTED Chemical Manufacturers

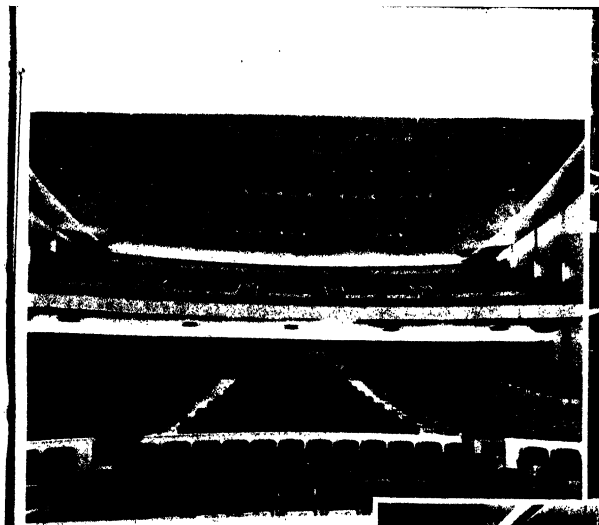
ONE of the armed services is seeking chemical manufacturers for the manufacturing of sulfur trioxide solution in chlorosulfonic acid (FS) Spec. 96-31-52; titanium tetrachloride (FM) smoke, and chloroacetyl chloride, an ingredient for the manufacturing of chloroacetophenone (CN).

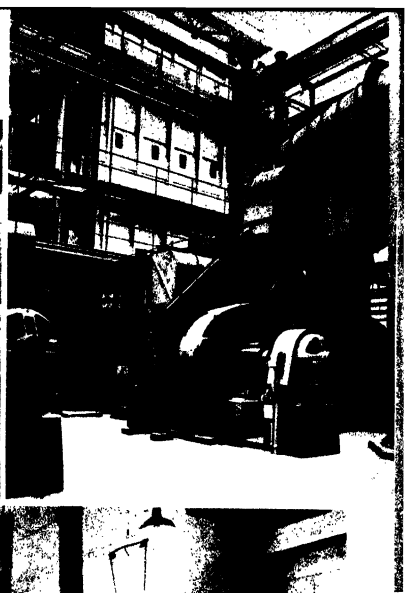
Only manufacturers will be considered; packaging concerns will not be considered. Bona fide chemical manufacturers are requested to address their inquiries in writing (do not call in person or telephone) to Engineer X, Contract Distribution, War Production Board, 122 East 42nd Street, New York, N. Y.

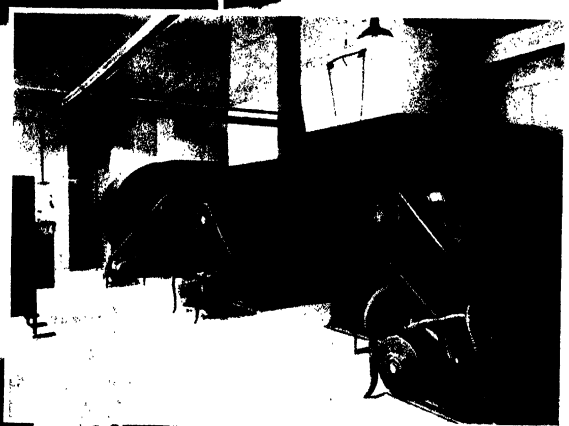
NEGOTIATIONS are reported between the governments of Egypt and Russia for exchange of Egyptian cotton for 50,000 tons of sulfate ammonia. These arrangements were broached prior to the outbreak of the present German invasion of Russia, but have been revived.

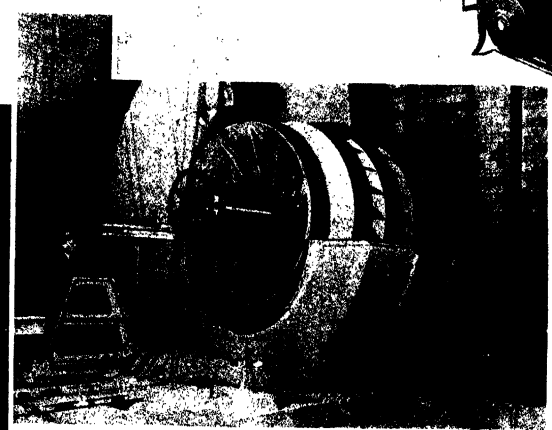


THE CHEMICAL NEWS PARADE









Installations of equipment of the Buffalo Forge Co. and its subsidiaries are pictured on these pages. Described on page 841 are this and other industries of Buffalo, scene of the 104th meeting of the AMERICAN CHEMICAL SOCIETY, September 7 to 11. *Upper left corner.* Squier cane mill in one of the newest United States cane sugar factories showing a succession of rolls crushing the sugar cane entering the far end. This shows the application of water and thin juice on the three last mills to dissolve the film of sugar juices in the cells of the fiber by successive freezings and soakings. The mills are driven by motors and steam engines through gearing on the right, and hydraulic pistons on top of each mill are controlled by air/oil pistons pictured at left. *Left.* Battery of high-speed sugar centrifugals in a refinery. They are the first high-speed heavy-duty units built with air-cooled clutches and brakes to eliminate the troubles of maintaining water-cooled brakes and clutches because of freezing, incrustation, clogging, and consequent overheating. *Left below.* Battery of cane mills designed for high-speed high-pressure work beyond commercial

ranges, installed in Louisiana State University sugar school factory for studying the advantages of cane milling in these new pressure and speed zones. The mill was built in Buffalo by Squier with speed reducers by Falk and complete individual electric drives by General Electric for each of the component units making the horsepower demand, speed, and pressure available by a recording chart for each individual unit. *Below.* Interior of the Memorial Auditorium, air conditioned by the Buffalo Forge Co. *Below right.* Building the housing around the rotor of one of the fresh-air fans used in the ventilation system of Midtown Hudson Tunnel. *Right.* Limit load fans installed for the ventilation of a public building. *Upper right corner.* Combination forced and induced draft fans in an oil refinery. *Above.* Interior view of Kleinhans' Music Hall to show the air-conditioning installation.

American Chemical Society[1]

104TH MEETING. Buffalo, N. Y., September 7 to 11, 1942.

105TH MEETING. Indianapolis, Ind., April 12 to 16, 1943.

106TH MEETING. Minneapolis, Minn., fall of 1943.

NATIONAL CHEMICAL EXPOSITION AND NATIONAL INDUSTRIAL CHEMICAL CONFERENCE. Stevens Hotel, Chicago, Ill., November 17 to 22, 1942.

Other Scientific Societies

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS. Netherland Plaza Hotel, Cincinnati, Ohio, November 16 to 18. Annual meeting.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Vancouver, B. C., September 9 to 11.

AMERICAN PETROLEUM INSTITUTE. Stevens Hotel, Chicago, Ill., November 9 to 13. Annual meeting.

NATIONAL PETROLEUM ASSOCIATION. Hotel Traymore, Atlantic City, N. J., September 16 to 18. Annual meeting.

NEW ENGLAND ASSOCIATION OF CHEMISTRY TEACHERS. University of New Hamsphire, Durham, N. H., August 11 to 14.

OPTICAL SOCIETY OF AMERICA. Massachusetts Institute of Technology, Cambridge, Mass., July 20 to 22.

TECHNICAL ASSOCIATION OF THE PULP AND PAPER INDUSTRY. Hotel Statler, Boston, Mass., September 29 to October 1.

[1] The list of the SOCIETY's National Officers and Directors, Editors, members of Council, Divisional and Local Section Officers, Committees, and Chapters of Student Affiliates appears in CHEMICAL AND ENGINEERING NEWS three times a year—usually February 10, May 10, and October 10. The latest list is printed on page 601 of the May 10 issue.

Samuel A. Woodruff has been named a research engineer on the technical staff of the Battelle Memorial Institute, Columbus, Ohio, and has been assigned to the division of organic chemistry. He was formerly associated with the North American Rayon Corp., Elizabethton, Tenn.

Twenty Thousand Expected at Chicago Chemical Show

IMPORTANCE of pure and applied chemistry in the solution of many wartime problems will be stressed at the second biennial National Industrial Chemical Conference and Exposition November 17 to 22 at the Stevens Hotel, Chicago. Foremost personalities in the industry will participate, according to committees now contacting eminent speakers.

"This assembly will be in the nature of a forum with leading authorities imparting their latest discoveries and processes in the rapid advancement of applied chemistry", said Victor Conquest, chairman of the Exposition Committee for the Chicago Section of the AMERICAN CHEMICAL SOCIETY, sponsor of the show and conference. "Never in the history of the industry have there been so many new developments brought about, of course, by the exigencies of the war. An exchange of ideas is important at this time with the United Nations leaning heavily on the chemical industry in the prosecution of the war."

Attendance is anticipated of more than 20,000 persons identified with the chemical industry, including research chemists, executives of industrial plants, engineers, purchasing agents, and government specialists. The show this year will be approximately twice as large in floor space as was the first exhibition in 1940. In addition to the Exhibition Hall, the Boulevard Room and connecting area have been pressed into service at the Stevens Hotel. It is reported that more than 75 per cent of the available space is already under contract. Prospective exhibitors are requested to communicate with Marcus W. Hinson, Manager, National Chemical Exposition, 110 North Franklin St., Chicago, Ill.

Steel Castings Production Discussed

WIDENING of the bottleneck in steel castings production and utilization of an untapped source of experienced labor by allowing wider use of steel produced by the cupola-converter method were suggested by C. E. Sims and F. B. Dahle, research metallurgists of Battelle Memorial Institute, Columbus, Ohio, before the annual meeting of the American Society for Testing Materials June 24 at Atlantic City, N. J.

Rapid expansion of side-blow converter steel production to meet the unprecedented demand for steel castings can be achieved by the cupola-converter combination. This method, a modification of the Bessemer process, Mr. Sims pointed out, has the further advantage that many of the cupolas are already available.

Early Bessemer steel was relatively impure and unrefined and therefore inferior in some engineering qualities. By use of the modern cupola with the converter, cast steel can be made to the same chemical composition as acid open hearth or acid electric cast steel. Data presented by Mr. Sims and Mr. Dahle show that properly made converter steel has engineering qualities on a par with steels made by other processes.

Cast steel is being used for airplane landing gears, gun mounts, tanks, and other ordnance material. Much welding and riveting is eliminated, and less metal is required. Cast steel armor plate has stood up well under ballistic tests, Mr. Sims added.

The Sims-Dahle report was based on a research investigation conducted in the laboratories of Battelle Memorial Institute and was sponsored by the Whiting Corp.

Motion Picture on Lubrication

THE Bureau of Mines' latest educational picture in sound, prepared in cooperation with an industrial concern, deals with the need for lubrication and methods of lubricating the great variety of machines that make the materials and supplies of war. Copies of the film, in 16-mm. sound, are available for exhibition by schools, civic, and business organizations, and other interested groups from the Bureau of Mines Experiment Station, 4800 Forbes St., Pittsburgh, Penna. No charge is made, but the exhibitor is expected to pay for transportation and any loss or damage.

Talc in Civilian Defense

ALTHOUGH the Office of Civilian Defense mentions talc for fighting fires caused by incendiary bombs, little stress is laid on its use. It is, however, one substance that is safe for fighting all sorts of bombs and has many special advantages.

First, its covering power, volume for volume, is far better than that of sand. Although it has a tendency to float on air currents, it adheres so firmly to whatever it touches that only a comparatively small volume need be used. Hence, it extinguishes a fire very readily.

Second, it adheres to magnesium particularly well and is very efficient for extinguishing burning magnesium. Obviously it is far safer and more effective than a water spray. It actually extinguishes the bomb instead of merely hastening the burning.

Third, it will extinguish burning oil. Talc will float on kerosene, etc., until it has adsorbed considerable oil. This makes it very superior for oil fires.

Fourth, it will adhere to phosphorous sufficiently to make it safe until it can be properly treated and disposed of.

RESEARCH

EVEN Pollyanna might have difficulty in finding a ray of sunshine in the situation in which many manufacturers have been placed because of present shortages of many materials. Nevertheless the resulting frenzied search for substitutes has often uncovered a hitherto overlooked product which has proven satisfactory or even superior to that formerly used.

Unfortunately, however, it has quite often been found that a new discovery is available in only limited amounts since the producer had not previously received sufficient encouragement to warrant installation of the equipment necessary for large-scale production. Even in such cases the research has not been in vain since with the return of normal conditions the producer will be able to supply the product in adequate amounts, the value of it having been established, and the user will have been awakened to the necessity of investigating all materials which he might use.

There is often a temptation to consider a particular product of manufacture as being entirely satisfactory as regards both quality and cost and to curtail research involving it. Because of present shortages of raw materials and equipment there is also a temptation to curtail research involving new products or new uses for present products.

Chas. Pfizer & Co., Inc. does not subscribe to such views. We believe that when the job now in hand is successfully completed our nation will find itself with a productive capacity greatly in excess of any that it has previously enjoyed and that now is the time to prepare to utilize this. We are increasing our research program, primarily of course in order to help do our share toward finishing this present job as quickly as possible, but also secondarily that new products and new uses for old products may be available for any surplus productive capacity to come.

Luminous Materials Exhibited

To aid in the evaluation of luminous materials, the Technical Committee of the New York Paint and Varnish Production Club has set up an extensive exhibit at the laboratory of the National Paint, Varnish and Lacquer Association, 1500 Rhode Island Ave., N. W., Washington, D. C. Officials of the Army, Navy, Office of Civilian Defense, and other government organizations are invited to see the exhibit, which will be open daily, except Saturday, from 2:30 to 4:30 P.M. Visitors are asked to phone Mr. Hart or Mr. Sward at Hobart 6272 for appointment.

In the first room, sources of black light are shown—a mercury vapor automobile headlight operated on a 6-volt battery, a mercury vapor lamp operated on low alternating current voltage, and a filament type lamp and ordinary light bulbs coated with phosphorescent paint. This room is completely darkened, and arm bands, signs, charts, plumbing fixtures, phones, fire extinguishers, sand buckets, buttons, outlines of doors, maps, and gadgets coated with luminous materials are seen. The black-light auto lamp is directed on a fluorescent target to show how traffic may be conducted in the dark. A table on which black light is directed from overhead contains many fluorescent articles.

A door marked "Air Raid Shelter" leads to a room with walls and ceiling entirely coated with phosphorescent paint.

By way of darkened winding stairs, the visitor is conducted to the next floor above. Fluorescent and phosphorescent directing signs and steps outlined with phosphorescent paint aid him in this otherwise perilous journey. Other applications of luminous paints and fluorescent dyes are displayed. Continuing to climb the stairs, the visitor arrives at the second floor. On exhibit here is a Mendelsohn black-light lamp that is used in airplanes to illuminate phosphorescent and luminescent instrument dials, charts, and the like.

The concluding item features various degrees of luminosity. Toy automobiles coated with phosphorescent paint represent the elapse of increasing intervals of time after activation. After the observer becomes dark-adapted, the objects are viewed under illumination equivalent to total darkness, a cloudless starlit night, and a bright moonlit night.

Soap Antioxidant Developed

War needs have taken away an ingredient normally used in toilet soaps to prevent rancidity and discoloration, but chemistry has already provided a replacement. The new ingredient, known as an antioxidant, is called SA 326 and was developed by Monsanto Chemical Co., St. Louis. The antioxidant used previously for this purpose has been an organic compound derived from toluene. Now all available toluene is needed for making TNT and other direct war materials. SA 326 is described by Monsanto chemists as an organic amine. It is made from raw materials currently available and not likely to be required in the war effort.

Although a replacement, SA 326 is not a "substitute". Developmental work on it began before the war but has been accelerated during the past few months. With thorough tests now complete, the product is in commercial production in equipment adapted from other processes.

OK'd by the Best!

Sure we're bragging, but—when companies like duPont, Socony-Vacuum, Shell Oil and Warner Quinlan use our tachometer we've got a right to be proud. Portable—less than 2 lbs. in weight, Jones Hand Tachometers are ideal for speed and rating checks on revolving platens, generators, turbines and motors of all types.

TAM ZIRCON AND ZIRCONIUM OXIDE CRUCIBLES

For temperatures up to 3500° F and 4500° F

TAM Zircon crucibles are finding wide application for various high temperature applications up to 3500° in non-ferrous melting such as aluminum, platinum, etc. These Zircon crucibles not only resist various acid and alloy reactions, but due to the straight line expansion coefficient of Zircon, exhibit exceptional good heat shock properties. Refractory bonds consisting of other compounds are not necessary in the manufacture of TAM Zircon crucibles thereby assuring the user of a pure Zircon product.

TAM small crucibles and shapes of semi-vitreous Zirconium oxide are manufactured for use in quartz fusions and high temperature applications up to 4500° F.

An experienced staff of field engineers, located in various parts of the country, are available for consultations without obligation. Write.

TAM PRODUCTS INCLUDE

Zircon bricks, special shapes and crucibles... Zircon insulating refractories... Zircon ramming mixes, cements and grog... Zircon milled and granular... Electrically Fused Zirconium Oxide Refractories... Electrically Fused Zirconium Oxide cements and ramming mixes... Electrically Fused Zirconium Oxide in various mesh sizes.

Three Queens

ALICE felt something heavy on her head; and reaching up, she took off what turned out to be a gold crown. On the crown was engraved "Science".

"So I'm Science," thought Alice. "I wonder who the Red Queen and White Queen are."

She managed to glance unobtrusively at the Red Queen's crown, and saw the words "Armed Forces".

"Very appropriate, too," thought Alice, "in view of the damage a fight has done to her face."

The engraving on the White Queen's crown was easier to read. The White Queen was sound asleep with her head in Alice's lap; and her crown said "Civilian Public".

"Now that you're a queen," the Red Queen was saying to Alice, "we expect you to do great things. Can you invent?"

"Certainly," said Alice, glad the first question was right up her alley.

"Invent a death ray," said the Red Queen sharply and pulled out a stopwatch, which she started and then almost immediately stopped.

"Time's up," she said. "Where's the death ray?"

"A death ray," said Alice, rather annoyed at the short time she'd been given, "is hardly a practical idea."

"Of course it's practical," said the Red Queen. "Even comic strips have them."

"Yes, but that's fiction," objected Alice.

"And since truth is stranger than fiction," said the Red Queen triumphantly, "you ought to have invented something even better than a death ray. We'll give you one more chance: Invent an airplane detector. Preferably one the Army will believe." And she rubbed her bruised right eye ruefully.

"Well," said Alice, "if I could have a few pounds of nickel for the preliminary fundamental research and—"

"Nickel!" screamed the Red Queen so loudly the White Queen almost woke up. "Don't you know nickel is used in armor plate? A few pounds of it would treat the steel for a plate on a tank. If we use ordinary steel on that tank, someone might be hurt."

"Without scientific instruments," said Alice, "a great many people are sure to be hurt."

"A wrong can't be corrected by another wrong," snapped the Red Queen. "We must protect our tanks. You can't have any nickel or anything else that requires a priority higher than A-2. Unless, of course, you file a special petition with WPB; and I think I'll have something to say about how *that* turns out, too."

The White Queen turned over in her sleep and half awoke. She patted Alice's knee affectionately.

"Don't let her worry you, dearie," she said sleepily. "If we ever have a war, our Navy will knock off those Japs in its spare time—some lunch hour, probably. The Navy told me so." And she went back to sleep again.

"Although you're a queen," said the Red Queen hurriedly, evidently wishing to change the subject, "I notice you've not yet rented an apartment in the capital."

Alice felt in her pocket and found only a few pieces of silver.

"Having become a queen just this minute," said Alice apologetically, "I've not had a royal allowance; and since I can't have one now, on account of the war, I hardly see how—"

"Where's your patriotism?" demanded the Red Queen. "Besides, isn't the good you do mankind sufficient reward?"

Alice was about to point out that good deeds are seldom accepted as rent money and that even patriotism was a poor reason for incurring bills she couldn't pay, when there was a loud "Caw! caw!" from overhead and the White Queen awoke with a convulsive start.

"The monstrous crow!" she cried. "He'll drop mustard gas on me! Help!"

She snatched both Alice's and the Red Queen's handkerchiefs, soaked them in the brook, and held them over her nose, kicking her heels on the ground and moaning.

"There, there," said Alice soothingly. "The largest crow in the world couldn't carry enough mustard gas to do you any real harm."

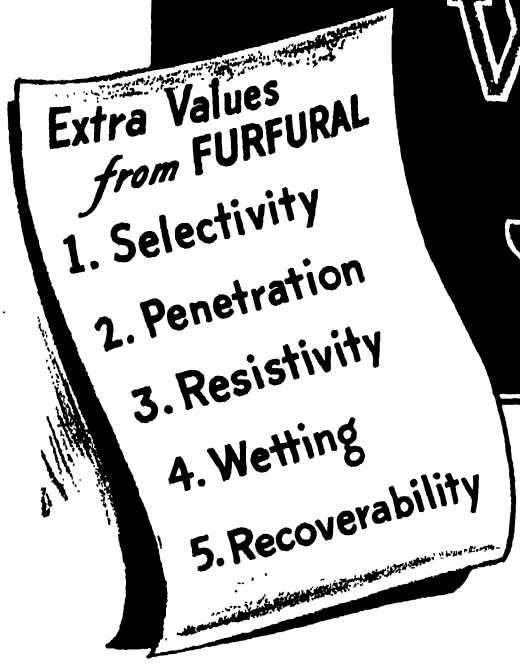
But the Red Queen was also looking anxiously skyward.

"You never can tell about that crow," she said. "Besides, he could easily carry enough gas to demoralize her." She turned quickly back to Alice. "In any case, why are you just sitting there instead of being hard at work on some handkerchiefs for me?"

"And an additional dozen for me," mumbled the White Queen.

"There's never been a war," said Alice, "in which you'd listen to me. In the old days, you wouldn't even believe me about ironclad warships and breech-loading cannon. However, I'll do your sewing. It'll only take a few minutes with a needle and thread and—"

"A needle!" screamed the Red Queen. "There you go again! Steel! For something you admit yourself isn't very necessary. I'm beginning to wonder whether you deserve to be a queen. You were a pawn up to a few moments ago, you know."



"A fifth-column pawn, probably," added the White Queen.

"Why, you two uppities," said Alice in righteous indignation, "I'm the most permanent reality here. If I could only wake up from this dream, I'd put you both back on the chess board and move you around sensibly—for a change."

"*Your* dream?" said the Red Queen. She pointed to a little man with a funny mustache, asleep on the other side of the brook. "You became a queen at all only because you're part of his dream. Making you a queen wasn't our idea, I'm sure. In fact, you're probably a good deal too friendly with him."

"Nonsense!" said Alice; but the next instant, whether dream or reality, she found herself without her crown sitting with yards and yards of homespun in her lap sewing like mad with a prehistoric bone needle. She was further than ever from being a queen.

Why buy Just any Solvent?

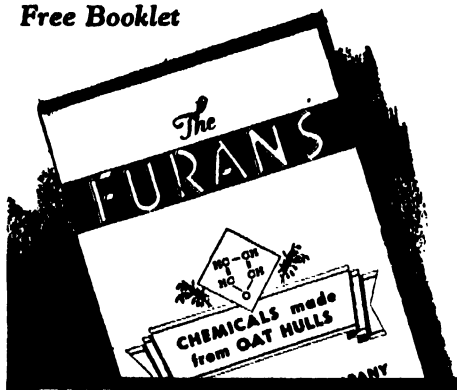
DON'T be satisfied with just dissolving action, when perhaps you can gain some extra value by selecting the proper solvent. That "something extra" is what many manufacturers like about Furfural. And remember—in tankcar lots a dime buys better than a pound of Furfural.

Furfural

It is the abrasive wheel manufacturers' best solvent for phenolic resin. The bonus is the excellent wetting action of the Furfural on abrasive grain, insuring a uniform mix and a strongly bonded product.

Many coating ingredients are soluble in Furfural. The extra is that although Furfural is used primarily as a solvent, frequently it contributes measurably to improved characteristics of the film.

Most notable of all, are the applications of Furfural as a selective solvent. Thus in petroleum refining, rosin refining and purification of other crudes, unique solvency properties of Furfural permit the separation of closely related substances. The ease with which it is recovered quantitatively adds to its industrial usefulness here.



Additional solvent uses are based on its ability to carry solutes into porous and semi-porous substances. Simultaneously it promotes wetting.

Ask for your copy of the free booklet entitled "The Furans" telling about Furfural and its derivatives. Your specific questions about the uses of Furfural are also invited.

Farrel-Birmingham Adopts War Production Slogan

In a recent contest in the Ansonia and Derby plants of Farrel-Birmingham Co. a committee of plant employees selected as a wartime slogan "Farrel Drives for Victory", submitted by Jeannette Larson, office secretary. The slogan expresses the thought that in building drives for Navy, Maritime Commission, and other ships these workers contribute to the Nation's drive for victory.

STEAM JET EVACTORS
AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

BARNSTEAD WATER STILLS

The character of your water supply should determine the type of water still to use. If your local water is soft, use the standard Barnstead Stills. If it is hard or highly contaminated, use the Barnstead Extra Duty Stills. In addition to all regular Barnstead features, the Extra Duty Stills have higher evaporators, to prevent foaming over; constant bleeder devices to prevent rapid scale formation; and special improvements that make it very easy to clean the still's interior. Sizes for all models range from 1/2 gallon per hour up. Operation is by gas, steam or electricity.

Acid-Base Catalysis. *R. P. Bell.* 211 pages. Oxford University Press, 114 Fifth Ave., New York, N. Y., 1941. Price, $3.50.

THIS book gives a clear, concise, yet comprehensive survey of the present status of one of the classical sections of classical physical chemistry, the catalysis of a variety of reactions by acids and bases. Those who were schooled in the concepts of hydrogen and hydroxyl ions as well as those more modernly trained in the acid-conjugate base concepts, developed largely by Brönsted, can read this volume with great profit. Every graduate student should know how this important aspect of quantitative physical chemistry has evolved as new measurements were achieved and as new concepts provided the spur to such measuring.

It is understandable that younger authors and workers in this field should fail to appreciate the difficulties and perplexities of those who were trying, prior to the 1914–1918 hiatus in academic science, to unravel the tangled skein of acid-base catalysis and who were using the, as we now know, mistaken concept of Arrhenius that the conductance of strong acids was due to a "degree of dissociation". Debye, Hückel, and Onsager smoothed the pathway of the later workers considerably, removing vital inhibitions. These circumstances might have induced the author to present conclusions reached in 1913–14 in the past tense rather than in the present tense (see pages 50–51); nor should one raise eyebrows excessively if an earlier worker guessed what ultimately proved to be the right form of the relation between catalytic constant and dissociation constant of an acid even when, of *all* the then available data, only four "can be regarded as approximately correct" (page 82). There are inaccuracies in the name index. The reviewer is credited there with several researches he never performed.

The volume reveals how vitally the work carried out in the field of acid-base catalysis has contributed to the dissipation of the mists of uncertainty that surrounded the electrolytic dissociation theory from its very inception and which troubled Arrhenius even to his final years. Today Arrhenius would have great satisfaction could he have this book to read for he would see clearly the formulation of so many difficulties and problems that beset him, and would see more clearly the limitations of his own postulates. The young student approaching this field today, via this book, can learn a more intelligible and comprehensive formulation of acids and bases, in terms of proton donors and acceptors, with quantitative applications in aqueous and nonaqueous solutions. In the final chapters (VII–VIII) he can trace the best ideas as to mechanism of protolytic reactions, what the newer theories of chemical kinetics in terms of the potential energies of the reaction complex and what isotopic reactions have to contribute; finally, whether proton transfer may occur by other than classical collisional methods, whether chemical systems can "tunnel" through energy barriers in the way that radioactive atoms disintegrate or atoms may be disintegrated. Bell discusses this whole field in a critical, balanced, and impartial manner which cannot but help the reader to a more mature knowledge of the whole field of physicochemical science.

HUGH S. TAYLOR

The Technology of Natural Resins. *C. L. Mantell, C. W. Kopf, J. L. Curtis,* and *E. M. Rogers.* 1st ed. 506 pages + vii. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y.; Chapman & Hall, Ltd., London, 1942. Price, $6.

DR. MANTELL has found an excellent outlet for the voluminous basic data on natural resins which he and his associates have collected in the past years. This data looks much more imposing and is of more distinct value when collected in handbook form than it was when originally presented as individual papers on solubilities and compatabilities.

The book is very timely, being published just when the more commonly used synthetic resins are becoming scarce and resin users must fall back to the use of certain available natural resins. Many of the younger men in industries using resins are

of such recent vintage that they haven't the knowledge of the natural resins which the old timers possess. To them this volume will be an excellent source book in which they may find most of the common knowledge of natural resins collected under one cover.

In the terminology of the book, rosin and shellac are excluded from the term "natural resin". This artificial exclusion works as a disadvantage in the latter part of the book. The opening chapters, well illustrated, describe in detail and in an interesting manner the source and general properties of the following classification of natural resins: Accroides, Congo, Damar, The East Indies, Elemi, Kauri, The Manilas, Mastic, and Sandarac.

The chapters dealing with physical properties put in one place the voluminous data resulting from the experiments carried on at the Netherlands Indies Laboratories. These data and the testing methods included in the last two chapters should be of value to have available in a single place.

The chapters dealing with the uses of natural resins in varnishes, paints, water emulsions, etc., suffer greatly because of the exclusive and biased standpoint from which they are written. The exclusion of the synthetic resins, rosin, and shellac make it impossible to give a true or valuable picture of the industries or products involved. The subjects discussed should be studied in a source with a less biased viewpoint. The book would be better if these chapters were eliminated.

Any technologist using natural resins should have a copy of this book in his library.

J. VERNON STEINLE

Nutritive Value of Dried and Dehydrated Fruits and Vegetables. *D. K. Tressler.* Technical Bulletin 262. 44 pages, paper covered. Division of Chemistry, New York State Agricultural Experiment Station, Geneva N. Y. Price, 15 cents.

OWING to the great need for concentrated foods for our armies and those of our allies and for overseas shipment for civilian uses, there is a marked increase in the demand for dehydrated vegetables and fruits. Curtailment of the supplies of tin cans used for canning vegetables and fruits is causing many canners to turn to dehydration as a means of preserving their products.

The dehydrated vegetables produced during World War I not only were lacking in palatability, but also rapidly lost all or nearly all of their content of vitamin C and carotene, the precursor of vitamin A. Much research work on processes of dehydration and nutritive values of dehydrated vegetables has been carried out during the past 25 years. This work has indicated the necessity of inactivating the enzymes of vegetables by scalding, or by some other means, prior to dehydration in order to obtain dehydrated vegetables of good palatability, high vitamin content, and good keeping quality. Recently it has been found that vegetables retain their vitamin C well if stored in the absence of air. It is probable that storage in an inert atmosphere aids also in the retention of carotene.

Dehydrated fruits retain vitamins, particularly carotene and vitamin C, much better than those which are sun dried. Sulfuring of fruits aids in the retention of vitamin C but causes the almost complete destruction of the vitamin B_1 content.

Although these researches indicate that dehydrated vegetables and fruits of much higher quality can now be manufactured, exact information concerning the best means of preparing and storing dehydrated vegetables and fruits of high vitamin content is still lacking. For this reason the Committee on Fats, Vegetables, and Fruits of the Food and Nutrition Board of the National Research Council requested the

Multiclones offer the most modern and effective mechanical method of gathering *any kind* of solid particles carried in a gas stream.

• Multiclones eliminate nuisance dusts. They control and recover valuable process powders. They clean air in smelters and do the double job of protecting property and saving valuable materials so urgently needed for war production.

• Multiclones can increase your output, reduce your costs and raise your working standard.

• Multiclones are all-metal, fireproof, simple, compact, abrasion-resistant, durable, inexpensive, built for *any* capacity, highly efficient and extremely low in operating cost.

review of the literature on nutritive value of dried and dehydrated fruits and vegetables presented in this bulletin. It is hoped that the bulletin will be useful to all engaged in the study of the dehydration of foods and that it will also call to the attention of nutrition experts, government officials, and food manufacturers the lack of information on proper methods of preparation, dehydration, and storage of vegetables.

Chemistry and Physiology of the Vitamins. *H. R. Rosenberg.* xix + 674 pages. Interscience Publishers, Inc., 215 Fourth Avenue, New York, N. Y., 1942. Price, $12.

THE phenomenal advance of the past few years in the identification, synthesis, and specific physiology of vitamins, particularly in the water-soluble group, has paved the way for a fully comprehensive review of this field. This work by Dr. Rosenberg is a necessary part of the armamentarium of those engaged in vitamin research, whether on the biological or chemical side.

In the chapters on individual vitamins the treatment covers historical development and nomenclature, occurrence, methods of isolation and proof of chemical composition, synthesis including space formulas of the various steps, industrial methods of preparation, biogenesis, methods of estimation and standards, relationships in plant and animal physiology including intervitamin relationships, and results of deficiency or absence. The treatment is fully adequate, and the bibliography complete and conveniently placed as footnotes to the several pages as well as in a separate index of authors. Literature through 1941 is reviewed, and this reader has not been able to detect any significant omissions.

The author has rigidly restricted himself to the function of a reviewer, refraining from allowing his personal feeling to appear in those cases where present state of knowledge is not clear or controversial, as for example in the identity of the chromotricia factor. Following the discussion of individual vitamins, there is a short chapter on nonidentified vitamins in which 17 such are listed and briefly discussed, and an appendix on "vitagens", which the author defines as being protective foods which at the same time act as suppliers of energy or as structural building units; i. e., essential amino acids, essential fatty acids, and essential carbohydrates and related compounds.

In the patent index some 1,000 American, British, French, and German patents are listed and briefly abstracted, the arrangement being chronological under each vitamin.

The work is exceedingly clearly and well written, surprisingly so for one to whom the English language is not native. The reader must search diligently to find even a slight error in idiom. The typography and mechanical workmanship reflect credit on the publishers.

ROE E. REMINGTON

An Outline of Organic Nitrogen Compounds. *Ed. F. Degering.* 381 pages. John S. Swift Co., 5 East Third St., Cincinnati, Ohio, 1942. Price, $6.

THIS book represents a development of ten years in the teaching of the chemistry of organic nitrogen compounds to graduate students. The material is presented in outline form, and is accordingly brief and to the point. The total coverage is, nevertheless, fairly comprehensive. This volume is designed specifically for graduate students, research workers, and specialists in the field of organic nitrogen compounds.

Production of Explosives in the United States. Technical Paper 636. *W. W. Adams, V. E. Wrenn,* and *L. S. Horton.* 30 pages. U. S. Bureau of Mines, Washington, D. C., 1942. For sale by Superintendent of Documents, Washington, D. C. Price, 10 cents.

Industrial CAMOUFLAGE Manual

Prepared at Pratt Institute, Brooklyn, N. Y.
By the Technical Faculty.
Konrad P. Wittmann,
Chief, Industrial Camouflage Program.

The long-awaited, authoritative technical guide to the concealment of industrial objectives from air attack.

The *FIRST* book on *INDUSTRIAL CAMOUFLAGE* published in America. Several groups of camouflage experts and engineers have collaborated to make this a most vital and timely volume.

Embodies the *most up-to-date information* relating to effective methods of concealment. Draws upon European experience plus research at the most advanced schools of civil defense in this country.

Discusses camouflage principles, methods and materials in *complete detail* and *illustrates ideas* with annotated diagrams, drawings, and photographs of models.

Shows exactly how to go about concealing industrial plants, grain elevators, water towers, parking areas, railroad yards, chimneys, storage tanks, docks, shipyards, airports, and many other structures.

PRACTICAL REFERENCE BOOK

Because of its clarity and wealth of detail, this book promises to be a standard reference for plant executives, and all others concerned with installing and maintaining proper industrial camouflage arrangements . . . as well as for architects, engineers, and other professional designers.

SARGENT
***Fluorescent* TITRATION LAMP**

Supplies soft, glareless fluorescent illumination of daylight quality, correct intensity and color characteristics to beakers in which titrations are being carried out.

A parabolic reflector in which is mounted a General Electric daylight fluorescent tube, directs light against a flat, white vitreous enameled inclined background—eliminating direct illumination and so preventing glare and undesirable illumination intensities. The outer surface of the lamp is finished in a dark blue vitreous enamel. Fitted with snapswitch, connecting cord and plug. Length, 12½"; height, 8"; depth, 4½". Complete with fluorescent tube, type T5, No. S-44285. For operation from 115 volt, 60 cycle circuits.

Fluorescent Titration Lamp S-44290 $13.00

SEC Survey on Drugs, Medicines

THE Securities and Exchange Commission has made public the 15th of a new series of industry reports of the Survey of American Listed Corporations. These reports cover the calendar years of 1939 and 1940 and extend earlier reports on the period 1934–39. Balance sheets and profit and loss statements, in both dollars and percentages, as well as surplus statements and financial ratios, are presented for individual companies and for the industry group as a whole in uniform tabular form.

Report No. 15 covers corporations engaged primarily in the manufacture of drugs and medicines which had securities registered under the Securities Exchange Act of 1934 at December 31, 1940. They are Abbott Laboratories, Allied Laboratories, Inc., American Home Products Corp., International Vitamin Corp., Lambert Co., Norwich Pharmacal Co., Parke, Davis & Co., Plough, Inc., Sharp & Dohme, Inc., Frederick Stearns & Co., Sterling Products (Inc.), United Drug, United Drug Co., Inc., Vick Chemical Co., and Zonite Products Corp.

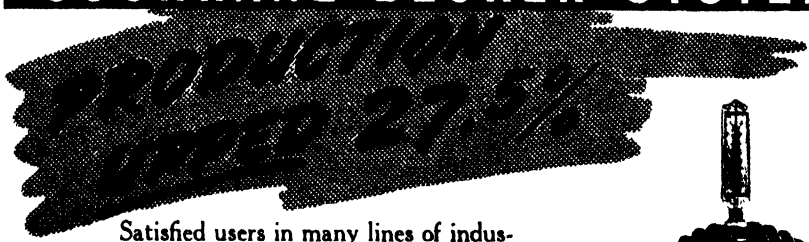
Combined sales reported by the group were $267,000,000 in 1940, compared with $256,000,000 in 1939. Net profits after all charges totaled $32,000,000 in 1940 and 1939, equivalent to 11.9 per cent and 12.6 per cent of sales, respectively. Total dividends paid out were $24,000,000 in each year. Combined assets totaled $244,000,000 at the end of 1940 compared with $231,000,000 at the end of 1939, while surpluses increased from $72,000,000 at the end of 1939 to $78,000,000 at the end of 1940.

Single copies of this report may be secured without charge by request to the Publications Unit of the Securities and Exchange Commission, Philadelphia, Penna. Other reports which are available in the series include No. 6, Chemicals-Fertilizers; No. 7, Oil Refining; No. 8, Non-Ferrous Metals; No. 9, General Industrial Machinery; No. 10, Electrical Supplies and Equipment Other Than Household Appliances; No. 12, Iron and Steel—Assets under $100,000,000 Each; and No. 14, Tires and Other Rubber Products.

Industrial Hygiene Surveys

TO ACQUAINT members with the purpose and procedure of industrial hygiene surveys, the Industrial Hygiene Foundation, Mellon Institute, Pittsburgh, Penna., has issued a booklet entitled "Conserving Manpower in War Industries". The surveys are conducted as a membership service to locate occupational health hazards, if any exist, and to recommend proper control measures.

WPB Booklet on Plant Efficiency



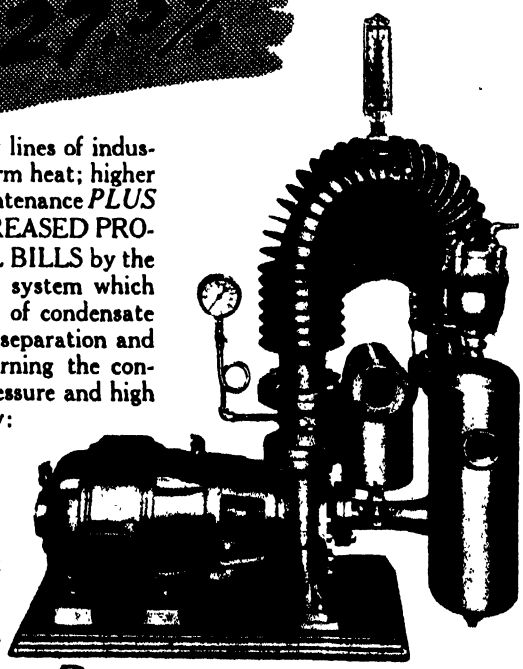
A BOOKLET on plant efficiency has been published by the War Production Board's Division of Information and is available for distribution on request. The title is "Plant Efficiency—Ideas and Suggestions on Increasing Efficiency in Smaller Plants".

Chapters deal with Good Lighting—Better Work; Cutting Down Accidents; Adapting Old Machines to New Jobs; Maintenance and Repair; Longer Life for Cutting Tools; Getting the Most out of Machine Tools; Production Lines Geared for War; Meeting Government Standards; Training Workers Quickly; Swing Shifts; Keeping Track of Orders, Production, and Materials; Plant Protection; Pooling Facilities; A Word on Priorities; and Getting into War Work.

Copies may be obtained from regional and local offices of the War Production Board, located in 120 cities, from local offices of the Division of Information, Office for Emergency Management, or by writing to the Division of Information, Office for Emergency Management, Washington, D. C.

PRODUCTION of 720 tons of kelp between May and July 1941 is announced from Eire, where this substance is important as a fertilizer. During the coming kelp season the amount is expected to be increased to 1,000 tons.

COCHRANE-BECKER SYSTEM



Satisfied users in many lines of industry tell of faster and more uniform heat; higher coil temperatures, and lower maintenance *PLUS lower fuel cost.* This means INCREASED PRODUCTION and LOWER FUEL BILLS by the Cochrane-Becker closed circuit system which speeds up the positive removal of condensate with automatic and continuous separation and removal of entrapped air, returning the condensate to the boilers at high pressure and high temperature. Typical reports say:

It shortens the drying time
Eliminates short circuited platens
Speeds draining of submerged coils and tubes
Aids drainage of jacketed equipment

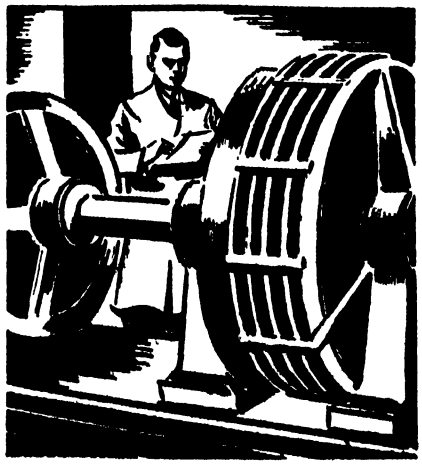
Indiana Standard Pledges War Aid



A SPECIAL message, "A Corporation Can't Shoulder a Gun... But Here's What We Are Doing to Help Win the War", has been enclosed with dividend checks to stockholders, monthly statements to customers, and the employee publication to employees in the armed forces by Standard Oil Co. of Indiana, Chicago. The booklet concludes with a pledge—"America no longer talks of defense. Today we talk of attack in every part of the globe where our enemies are found. For that attack there must be more ships, more planes, more tanks, more guns—more fuels and lubricants for those weapons and the plants that make them. Towards producing its full share—and more—Standard of Indiana pledges its main effort and concern."

Coal Coking Properties

CERTAIN coals heretofore considered unsuitable for wartime production of coke and its by-products probably can be used for these purposes, it is revealed in comprehensive tests conducted by the U. S. Bureau of Mines. It is indicated that some of the "borderline" coals can be used with comparative safety if proper measures are observed. Some of several blended coals, also investigated by the technicians, responded favorably to the tests. A copy of the report on the experiments may be obtained by writing the U. S. Bureau of Mines, Department of the Interior, Washington, D. C., for Report of Investigations 3,644, "Expansion of Coal during Coking", by James T. McCartney and Joseph D. Davis.

Zinc in Wartime

THE third in a series of folders on the wartime status of zinc has been issued by The New Jersey Zinc Co., 160 Front St., New York, N. Y. Illustrated and described are some of the applications for zinc as a war material. The folder points out that no war use lacks the zinc it requires.

HAVE YOU A Problem in

Capitalize the Service of the Carey REPRESENTATIVE

Today, more than ever—the big job of the Carey representative is *serving* industry. His time for the duration is dedicated to helping you attain utmost economy in plant maintenance—top efficiency in plant operation.

Every Carey man is thoroughly trained from the ground up in the use and application of Carey Products. Representing one of the oldest and largest manufacturers of roofing, waterproofing and insulation materials in the country, he is qualified by experience to make practical recommendations.

Capitalize this Carey service when our representative calls on you. Whatever your needs, you'll find that he will do everything humanly possible to be of real help in analyzing your problems and in finding the economical answers. For details address Dept. 64.

Carey PRODUCTS INCLUDE:
BUILT-UP ROOFINGS • ROOF COATINGS
HEAT INSULATIONS • CAREYDUCT
INDUSTRIAL ASPHALT FLOORING
ASPHALT ROOFING & SHINGLES
ROCK WOOL INSULATION
ELASTITE EXPANSION JOINTS
ASBESTOS-CEMENT CORRUGATED ROOFING & SIDING

Uniform Tests for Derris-Root Rotenone Content Considered

RESULTS of recent experiments in establishing uniform methods of determining derris-root rotenone content have proved very satisfactory, according to the annual report for 1941 of the Imperial Institute of the United Kingdom. Further adjustments are necessary to adapt the tests entirely for tropical use, it is said, while to make the analytical control of derris effective, it will also be necessary to improve present methods of sampling the roots. It is reported experiments in this direction are under way.

Eire Promotes Domestic Production of Drugs

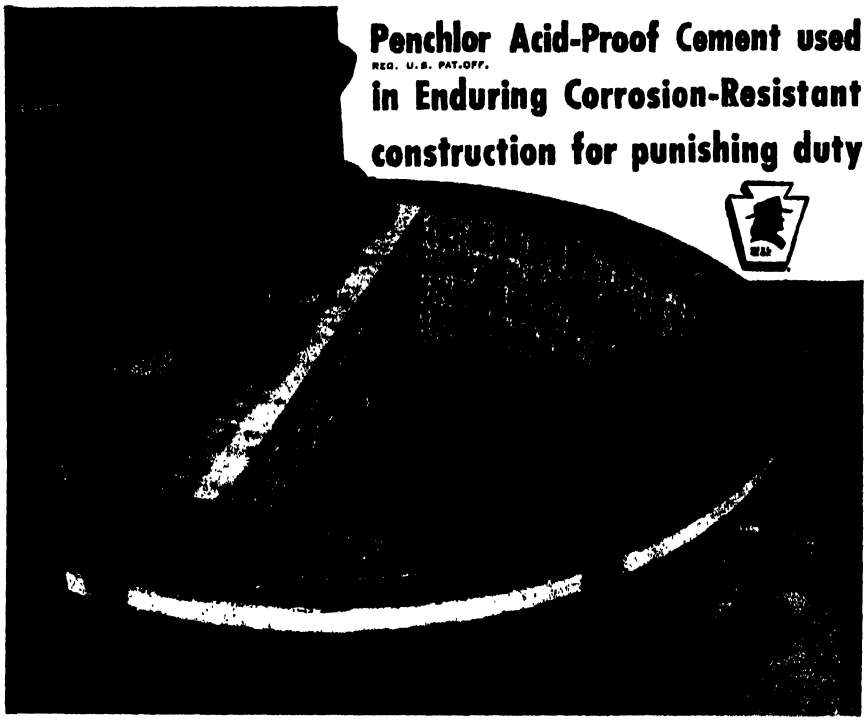
AUTHORITIES of Eire are doing all possible to promote domestic production of drug and medical requirements, according to reports from that country. Anesthetic ether, formalin, glycerol, invert sugar, and lactosum are being produced on a scale said to meet minimum domestic needs. An Irish firm is producing a cod liver oil substitute by adding vitaminated oils, imported from the United States, to domestic vegetable oils. This last output is at present on a very limited scale and not equal to requirements.

Shellac and Jute in Plastics Receives Attention in India

COMBINED use of shellac and jute, India's two major trade items, is receiving much attention by authorities, the U. S. Department of Commerce reports. Jute waste is being used as a filler in shellac plastics, while new developments are the use of both the jute fabric and waste with shellac molding powder in manufacture of cheap laminated boards and the treatment of jute fiber with shellac resins to produce proofed materials.

Shellac molding powder being used in manufacture of technical electrical goods, such as switches, has been improved and the curing time in press is said to be almost equal to that of imported Bakelite powders. Cost has been substantially reduced by cutting proportions of urea-formaldehyde in the composition.

Increase in Chemical Output in Canada



THAT Canada is turning out very large quantities of chemical products is reported by the Department of Mines and Resources at Ottawa. Production of sodium chloride increased from 464,714 tons valued at $2,823,269 in 1940 to 560,827 tons valued at $3,008,281 in 1941. About 46 per cent of the total output in Ontario was used in the production of heavy chemicals. Production of sodium sulfate from Saskatchewan deposits reached a record total of 115,601 tons in 1941, compared with 94,260 tons in 1940.

Denmark to Try Local Production of Morphine

PREWAR attempts to start domestic production of morphine are being revived in Denmark, it is reported. At an earlier period substantial areas were given over to attempted cultivation of opium poppies. This venture was not so profitable as expected and never went beyond the experimental stage. To date Denmark has continued to rely on imports of morphine, but later this summer it is felt that again it will be necessary to intensify the effort to produce opiates locally.

TURKEY is reported to have a vaseline shortage, with the government calling for bids to meet national defense requirements. These average 120 tons annually, the normal annual consumption in Turkey being 500 tons. In 1941 imports amounted to only 105 tons, of which the United States supplied 5 tons and the remainder came from Rumania.

PLANS for a new nitrogen fixation works in Denmark are reported from abroad. Under this program a power plant, coke oven, and a direct ammonia production unit are to be built at a cost of $40,000,000.

Penchlor Acid-Proof Cement used
REG. U. S. PAT. OFF.
in Enduring Corrosion-Resistant construction for punishing duty

This acid-proof, brick-lined tank, in a leading chemical plant, must stand up to the toughest kind of service. Scrap iron, in half ton loads, is dumped into such tanks twice a day, to be treated by hot acid in the manufacture of ferrous and ferric chloride. Some of these tanks have been in service over six years.

The quick-setting and self-hardening properties of Penchlor Acid-Proof Cement recommend it highly for new construction—particularly now, when time-saving is so important in war efforts. With Penchlor Acid-Proof Cement you can get brick-lined equipment into service without delay.

If you require a cement of exceptional strength and high resistance to abrasion, you will be interested in these Pennsalt *resin* cements: *Asplit*, for conditions always acid . . . *Causplit*, for alternate acid and alkaline conditions. These are easy to handle and will withstand a wide range of corrosive conditions, up to 350 degrees F.

Our engineers have had wide experience handling acids and alkalis in our own plants and are at your service at anytime, without obligation. Write fully. Or, if you prefer, use the coupon.

Kodak Revises Information on Nitrogen Isotope N^{15}

As announced in January 1942, the nitrogen isotope of atomic weight 15 is now available in the form of ammonium nitrate in which the nitrogen of the ammonium radical has been enriched by the chemical exchange method of H. C. Urey[1]. Effective immediately, N^{15} will be offered in the following concentrations: (1) approximately 14 atom per cent N^{15}, (2) approximately 30 atom per cent N^{15}, and (3) approximately 60 atom per cent N^{15}. The former listing of 7 per cent material is discontinued. The 60 per cent material is now offered for the first time. For purposes requiring only low concentrations of N^{15}, material can usually be supplied on special order at less than the price of 14 per cent N^{15}. Prices will be quoted on request, and depend upon the quantity and concentration required and the supplies available. Distribution is on a direct basis only, and no discounts are given. Standard packaging units are 0.1 gram or multiples thereof.

Orders or communications concerning N^{15} should be sent to Eastman Kodak Co., Research Laboratories, Department WOK, Building 59, Kodak Park Works, Rochester, N. Y.

[1] *J. Chem. Phys.*, 5, 856-68 (1937); 6, 296 (1938); 7, 34-39 (1939).

Du Pont Trade-Marks New Fungicide

A new fungicide, ferric dimethyl dithiocarbamate, has been given the trademark Fermate by E. I. du Pont de Nemours & Co., Inc., Wilmington, Del. Additional experiments and supervised commercial applications this season are expected to lead to greater availability of Fermate for general commercial use another year, provided this year's results are favorable and emergency conditions do not interfere with production.

Who Makes It?

Sources of supply for the following chemicals are wanted by the National Registry of Rare Chemicals, Armour Research Foundation, 33rd, Federal, and Dearborn Streets, Chicago, Ill.:

1-1-Ditolyl ethane; 4-amino quinoline; diiodo hexametildiamino isopropanol; lactic dehydrogenase, crystalline; straub flavoprotein; succinic dehydrogenase preparation; tetramethyl thiurun; glucosides of mono- or polyhydroxyanthraquinones; diethyl oxomalonate; alkyl silicates; diamino acetone; poly peptides, amino acid; and myosin.

ARTISAN
WORKS FOR VICTORY

SERVING THE CHEMICAL PROCESS INDUSTRIES

All hands at Artisan — workmen, engineers, secretaries, and administrative staff — have joined efforts for full speed ahead to help America win its war of production. As with most engineering and manufacturing concerns, Artisan is very busy. No longer does the whistle blow at 5. Day and night shifts of skilled workmen — artisans all — produce equipment for the Chemical Industries. . . . All especially designed to meet specific needs.

Experimental Stainless Steel Kier

Evaporators in Process of Fabrication

ARTISAN DESIGNS

Artisan engineers are experienced in designing units for special problems, working in cooperation with your plant engineers and executives on a confidential basis. Our staff includes specialists in designing distillation equipment, heat transfer, evaporation, and fluid flow apparatus. Pilot plant equipment orders receive the same thorough attention as larger units.

ARTISAN MANUFACTURES

Our foremen and workmen have worked successfully with all the generally used metals and alloys including: Aluminum, Copper, Everdur, Lead, Monel, Nickel, Inconel, Steel, Stainless Steel, Clad Steels, and Hastelloy. We have qualified processes for the welding of unfired pressure vessels and miniature boilers which can be stamped A.S.M.E., National Board Standard, and Hartford Steam Boiler.

Vitamin C Staves Off Heat Prostration

Two tablets a day of "beat-the-heat" pills containing vitamin C are keeping heat prostration away from many war-production workers this summer, according to physicians of the du Pont company's Medical Division. They have found the pills a preventive of heat cramps and heat exhaustion, even where the temperature is above 100° and the humidity is oppressively high.

John H. Foulger, director of du Pont's Haskell Laboratory of Industrial Toxicology, at Wilmington, Del., who recently discussed this application of vitamin C at the 20th annual conference of the Milbank Memorial Fund in New York, suggests this measure might well be employed in many other plants, including steel mills, foundries, and shipyards, where high temperatures are encountered. It should also prove valuable, he says, in engine rooms of naval and transport ships and among troops in the tropics.

U. S. D. A. Develops Rubberlike Material

At the Northern Regional Research Laboratory of the U. S. Department of Agriculture, Peoria, Ill., chemists working with such farm products as soybean oil and corn oil have produced materials that look, smell, and feel much like natural rubber. Some of these products will stretch 200 per cent or more and return to their original forms, and show tensile strengths of approximately 500 pounds per square inch. The general run of natural rubber has a 600 per cent stretch and a tensile strength of 3,000 pounds or more. Nevertheless these substitutes are promising for some purposes, say bureau chemists and engineers. Most of the work so far has been on a laboratory scale only, but some of it is being tested in a pilot plant.

Research on Nickel at Mellon Institute

The International Nickel Co., Inc., New York, N. Y., has resumed investigational work at Mellon Institute of Industrial Research, Pittsburgh, Penna., by the establishment of an industrial fellowship that began operation on July 1. This fellowship is concerned with a comprehensive program of scientific research on certain problems in the chemistry and technology of nickel, embracing particularly the preparation, properties, and uses of nickel compounds, especially organic derivatives.

Alginic Acid Textile Fibers

C. H. S. Tupholme, St. Christopher's, Firgrove Hill, Farnham, Surrey, England

It is known that fibers can be made from alginic acid by extruding a solution of sodium alginate from a spinneret into an acid coagulating bath. The spinneret may have any desired number of holes, and the group of filaments is collected as a continuous thread with a revolving bobbin or spinning box. After being washed, the cake of yarn is subjected to hardening agents, such as a solution of alum. Alternatively the coagulating and hardening processes may be combined by extruding a solution of sodium alginate into an acid solution of calcium chloride, for example, when filaments of calcium alginate are obtained.

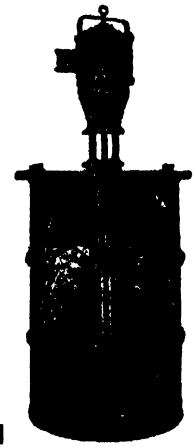
In practice, it has been difficult to separate the individual filaments within the thread, since they are gelatinous when first spun and adhere to one another during spinning and subsequent treatments. The yarn is strawlike in handling properties and totally unsuitable for textile purposes. A means for keeping the individual filaments separate in the yarn during the spinning and subsequent processes would overcome the difficulty.

A British concern has developed a process which involves, in the spinning of alginic acid and metal alginate yarns, coating of the filaments with oil during or immediately after coagulation before they can adhere. Filaments coated with oil in this way do not stick together during coagulation and remain separate permanently so that the handling properties are not interfered with.

The most convenient method of applying the oil is by dispersion in an emulsified form in the coagulating bath. A second method, which may be used in conjunction with the first, is to pass the filaments through an oil emulsion after leaving the coagulating bath on the way to the winding mechanism.

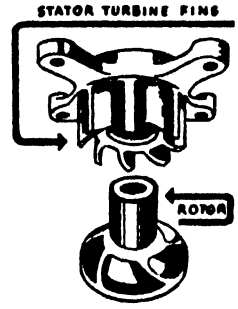
In a typical example of this process, 5.5 per cent solution of sodium alginate is extruded into a coagulating bath having the following composition: 0.5 *N* sulfuric acid, 2.5 per cent olive oil, and 0.25 per cent of an acid-stable emulsifying agent. The thin film of olive oil keeps the filaments apart and the handling properties of the resulting yarn are greatly improved. If the emulsifying agent employed is cationic in character, a further improvement in handling properties is obtained because of retention of the emulsifying agent by the filaments. Yarn prepared in this manner can be made into hanks and after-treated with hardening agents in the usual way.

If the acid coagulating bath contains emulsified oil, the yarn handles satisfactorily. It is subject, however, to a serious disadvantage on account of the ease with which it is swollen and dissolved by dilute alkalies. This difficulty may to some extent be overcome by after-treating the yarn with hardening solutions of metal salts, such as calcium chloride or potassium aluminum sulfate, or by spinning directly into a bath containing acid and a metal salt such as calcium chloride. The degree of resistance to alkaline attack is, however, insufficient to make the fibers suitable for normal textile usage.



A more satisfactory method involves using salts of metals possessing high coordinating power, e. g., chromium, instead of salts of metals such as calcium and aluminum. Such salts are applied in polymerized form so that a large number of acid side chains of alginic acid are combined with a molecule of the polymer. Metals of high coordinating power, of which chromium is the most common example, are well known. It was previously proposed to coagulate filaments of alginic material with salts of other metals, including zinc and calcium, but none of these has high coordinating power. Metals having high coordinating power form salts in which the radicals are not only united as in simple salts by polar bonds which break up in solution and ionize but also by auxiliary bonds. Consequently, it is the distinguishing feature of this process that the high coordinating power of chromium or other similar metals is utilized to produce nonionizing compounds of alginic acid.

The fibers may be produced first in the form of alginic acid or an alginate and then converted to the combination of a metal of high coordinating power by contact with a solution of a salt of the metal, such as basic chromium acetate. Basic chromium acetate is prepared in the following manner. Chromium hydroxide, freshly precipitated from chrome alum with ammonia, is filtered off, washed free from ammonia, pressed well and, without drying, 1 mole is ground up with 2 moles of cold glacial acetic acid. Sufficient water is added to give a solution containing the same amount of chromium as does a 20 per cent solution of chromium triacetate. The mixture is aged at air temperature for 6 hours, during which time the remaining crystalline solid dissolves. Finally the solution is warmed to 40° C. for 10 minutes.



This stock solution is diluted with 20 times its volume of water or dilute acetic acid before use. Hanks of yarn, whether or not treated with a solution of a simple metal salt such as alum or calcium chloride, are immersed in the solution. After 30 minutes the hanks are removed, washed off in water, and dried.

The alkali-resistance of the resulting

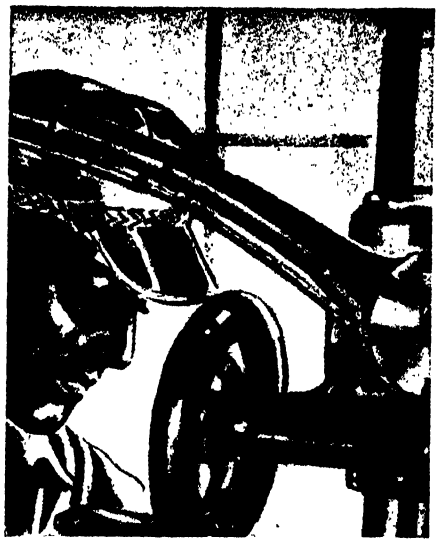
WITH
HOMO-MIXER'S
ADVANCED PRINCIPLE



INDUSTRY must win the race against time! But more than a great time-saver is the Eppenbach HOMO-MIXER. It's also engineered for finer diffusion.

Its principle is wholly different. There is no vortex, no air to affect the mixture. Only a fraction of the mass is worked at one time, creating more uniform dispersion. The material is rapidly forced up from the air-free bottom by the stationary turbine fins. With tremendous pressure and turbulence, the flow surges upward, outward and down. The entire batch completes this cycle in just a minute or two. No clamping to tank, no setting at angle, no vibration.

HOMO-MIXERS are doing a big job in process plants today—batteries up to a hundred! Write us!

Layne Quality

Has Set A World Standard!

Efficiency, Ruggedness and Long Life are the three outstanding and world recognized features of Layne Well Water Systems. Those features are the result of more than sixty years of water producing experience, specialized engineering skill and ceaseless endeavor to build better pumps and wells.

Thousands of Layne Well Water Systems are now serving, and have long served leading industrial plants, railroads, irrigation projects and municipalities throughout the United States and the Dominion of Canada. Hundreds also, are in use in foreign countries throughout the world.

Each Layne unit is designed and custom built to fulfill its particular task—the production of the largest quantity of water at the lowest possible operating cost. Various parts of the systems: pumps and component pump parts, motors, etc., are of standard manufacture and dimensions. Thus, repairs or replacements, when required, may be made at minimum cost. Each system is completed as a unit, then thoroughly tested and delivered in operation.

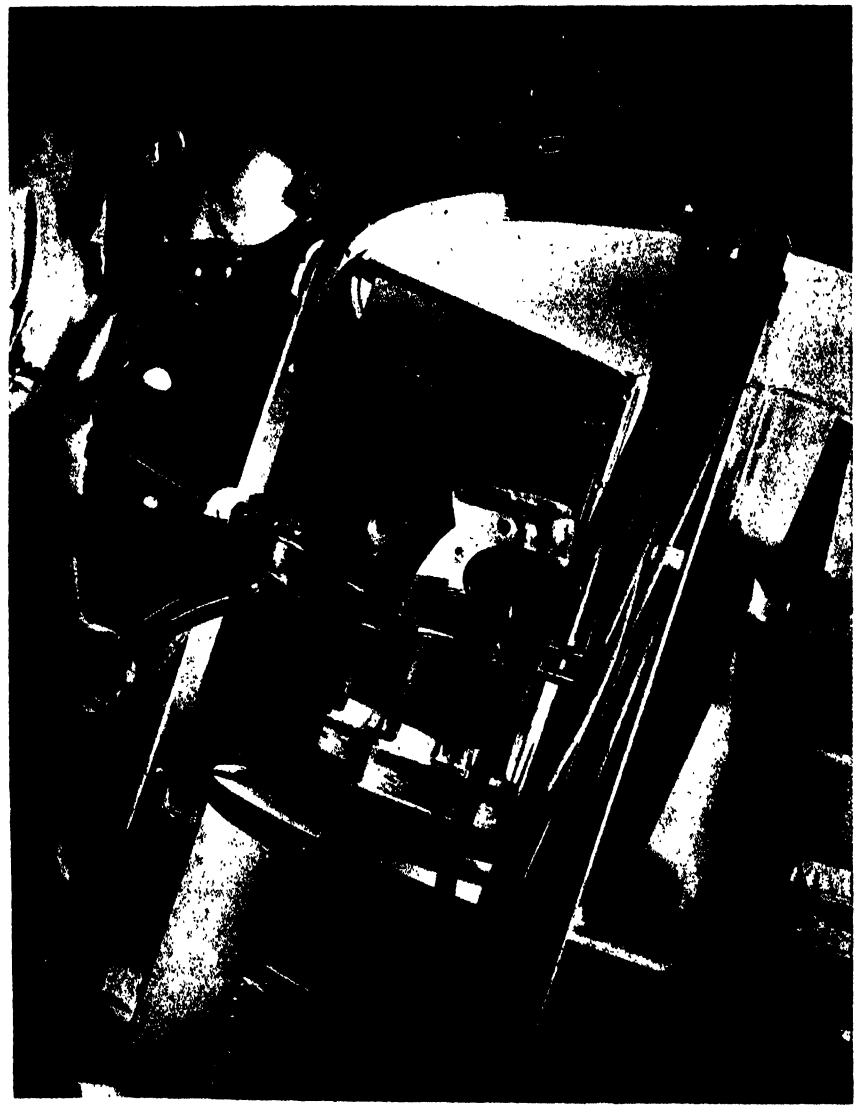
yarn, which is gray-violet in color, is much greater than with the alum treatment described above. Moreover, it increases with increasing temperature of drying. Yarn dried at room temperature was dissolved by a solution of soap and soda in 14.5 hours. Yarn dried in an oven at 85° to 100° C. was not dissolved in 24 hours. The chromium alginate yarn has the additional advantage of possessing an affinity for chrome mordant dyes.



Reprint Orders

BECAUSE articles printed in both the Industrial and Analytical Editions of *Industrial and Engineering Chemistry* are now copyrighted by the AMERICAN CHEMICAL SOCIETY, permission must be secured before reprints can be supplied to others than authors of the papers in question. Requests should be addressed to the Editor, *Industrial and Engineering Chemistry*, 1155 Sixteenth St., N. W., Washington, D. C.

Sulfadiazine Ointment for Burns Developed

NEW effectiveness in the treatment of burns and skin infections is promised by the use of sulfadiazine, newest of the sulfonamide drugs, in the form of an ointment, according to Lederle Laboratories, Inc., Pearl River, N. Y. Extensive clinical tests have been made in hospitals in Baltimore, Boston, Birmingham, Memphis, Rochester, and elsewhere. Military use of the treatment has been extensive in caring for casualties in our armed forces.

Sulfadiazine treatment of burns was first developed by Kenneth L. Pickrell, of Johns Hopkins Hospital, who employed a solution of sulfadiazine with triethanolamine with excellent results. The solution is not always convenient to use, and at Dr. Pickrell's suggestion a soft, water-soluble ointment having like effectiveness has been developed. Both are available to the medical profession.

ROBERT YARNALL RICHIE

Molten aluminum is sprayed on these aluminum airplane engine castings to improve their resistance to corrosive attack. This photograph is reproduced from the *Aluminum News-Letter* by courtesy of the Aluminum Co. of America in Pittsburgh, Penna.

Business Statistics

We are indebted to the Manufacturing Chemists' Association, 608 Woodward Bldg., Washington, D. C., for the following figures showing business conditions.

Monthly Statistical Report on Business Conditions

Chemical Industry Raises $46,917 for New York Fund

J. J. Lincoln, Jr., president of Air Reduction Co., Inc., and chairman of the Chemical Division of the Greater New York Fund's 1942 drive, has reported that the group already has reached gifts of $46,917. Mr. Lincoln said he is confident that they will raise more than $50,000 before the campaign is over. Last year the division gave $39,639.

Members of the committee include Howard Berry, Mathieson Alkali Works; Robert W. Boggs, Union Carbide & Carbon Co.; John J. Butler, Jr., Industrial Chemical Sales Co.; W. M. Dennis, American Cyanamid Co.; J. E. Ferris, Niagara Alkali Co.; Howard H. Foster, Air Reduction Co.; Charles L. Gabriel, Commercial Solvents Corp.; Paul Hiller, Innis Speiden & Co.; Milton F. Martin, U. S. Industrial Chemical Co.; Charles F. McKenna, Jr., Commercial Solvents Corp.; Walter J. Schappa, E. I. du Pont de Nemours & Co., Inc.; A. Lucian Walker, Jr., Texas Gulf Sulphur Co.; and Sumner W. White, Jr., Mutual Chemical Co.

Alexander Lowy Fund Established

Mrs. Alexander Lowy has established a fund in memory of her late husband who for over 20 years was professor of chemistry at the University of Pittsburgh. This fund is to help worthy individuals in the course leading to the degree of bachelor of science in chemistry or to the Ph.D., irrespective of race or creed.

Remarkable Economies for Users of

DISTILLED WATER

NO HEAT REQUIRED

Modern Chemical-Treatment Method now being used by

CHEMICAL PLANTS
AIRCRAFT PLANTS
DISTILLERIES
PHARMACEUTICAL HOUSES
SYNTHETIC RUBBER PLANTS
PORCELAIN ENAMELING PLANTS

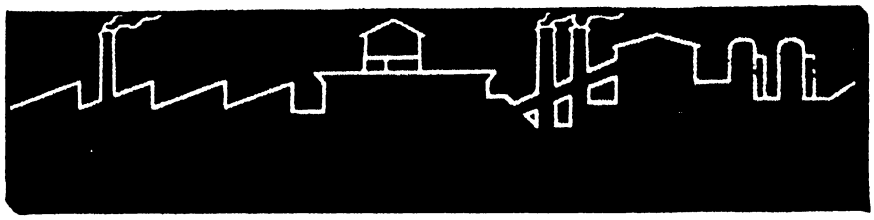
★ *The process is one of ion exchange using the Amberlite synthetic resins, and produces a final effluent which compares very favorably with heat distilled water.*

The ILLCO-WAY method of producing water replaces heat distillation *at a fraction of the cost*, and is daily meeting the exacting standards of industrial and technical concerns requiring purified water. The water is not evaporated, so no heat is used in the process!

1,000 gallons for less than a dollar!

LOW COST — The cost of the treated water is amazingly low — *less than a dollar per thousand gallons*, on the average water supply. And when the supply is low in dissolved solids, the cost may be considerably less.

No heat used—No fuel required!



Operation is completely automatic (between periodic regenerations). Pipes will not lime up. Maintenance costs are reduced to a minimum. A unit delivering 300 gallons an hour occupies a space about 4 x 10 feet. Made of finest materials to protect the purity of water. Available in units affording from 120 gallons an hour to 50,000 gallons an hour.

Cellulose Leather Substitute

THE importance of scientific substitutes in filling gaps caused by diversion of vital war materials is reflected in the introduction of Onco V, a new cellulose product developed by Brown Co., 500 Fifth Ave., New York, N. Y.

The cellulose base for Onco V was originally discovered during research experiments on filter materials for gas masks. First commercial use was as an insole fabric to replace latex-impregnated materials commonly used before the rubber restrictions. It is believed that it may be a logical substitute for leather and cork in other industries.

Reorganization of General Printing Ink Corp.

AS A result of the demands for industrial finishes and other protective coatings made by the war program upon the individual divisions of the General Printing Ink Corp., 100 Sixth Ave., New York, N. Y., it has been decided to pool the facilities of the entire corporation into one division, General Industrial Finishes.

John F. Devine, vice president of the corporation and general manager of the Fuchs & Lang Manufacturing Co. Division, will also act as general manager of the General Industrial Finishes Division. Walter A. McKim, previously director of industrial research for the Pittsburgh Plate Glass Co., will be assistant general manager.

Substitutes for Tin-Base Babbitts

TWO new bearing metals, known as Pyramid and Defender, have been developed by the Magnolia Metal Co., 120 Bayway, Elizabeth, N. J., as substitutes for tin-base babbitts which are now so difficult to secure.

Pyramid metal is suited to applications where bearings must withstand heavy sustained pressures, as in marine reciprocating engines, water turbines, paper mill calendar stacks, and rolling mill machinery.

Defender metal stands shocks without cracking and is suited for use in internal combustion engines, trap rock crushers, and sifter machinery.

THE Seaboard Engineering Co. has opened an office at 29 Church St., Paterson, N. J., under the management of G. J. Zurcher, vice president and general manager.

Chemists and Chemical Engineers Needed in the Production Army

Reichhold Chemicals Receives Navy E Pennant

THE first Navy E pennant to be awarded to a manufacturer of synthetic resins has been received by Reichhold Chemicals, Inc., Detroit, Mich. The pennant was awarded in public recognition of "excellence in industrial production" of materials vital to the Nation's war effort.

Sight Feed Bubbler

THE Meriam Co., Cleveland, Ohio, has developed a sight feed bubbler for the continuous operation of tank liquid level gages. This unit has wide application where a sight indicator is required, to purge lines, to note the presence of harmful or undesirable gases, and to use with flowmeters for the measurement of corrosive materials.

In operation, the bubbler bowl is filled with liquid. The rate of bubbling is adjusted by means of a stainless steel needle valve at the top of the unit. All air or gas passes the needle valve before entering the bubbler tube inside the bubbler bowl.

Chemicals for Rubber Reclaiming

PRODUCTION of solvents and chemicals from southern pine wood is believed sufficient to meet the wartime needs of the rubber reclaiming industry, Charles A. Higgins, president of Hercules Powder Co., has announced.

The company, anticipating a greater demand by reclaimers for its Solvenol, Tarol, and Staybelite used in reprocessing, last year expanded its Brunswick, Ga., and Hattiesburg, Miss., plants to increase the output of these pine wood derivatives.

Reclaim production in the United States last year exceeded 25 per cent of total American rubber consumption. Its volume increased from 210,000 long tons in 1940 to 280,000 long tons, and this year the estimates call for more than 300,000 long tons of regenerated rubber.

Ultra High-Pressure Flowmeter

IN HIGH-PRESSURE process operations in the neighborhood of 5,000 pounds per square inch, flow measurement has been impracticable with mechanical head-type meters employing a stuffing box. Accuracy, freedom from maintenance, and safety are secured by a special adaptation of the ring balance (tilting U-tube) which has no float, stuffing box, or pressure-tight bearing. The unit was developed by the Cochrane Corp., Philadelphia, Penna.

Dibutylamine, drums, l. c. l., wks.	lb.	.64
Dibutylphthalate, drums, c/l., dlvd.	lb.	.21
Tartrate, drums	lb.	.92
Dichloroethyl ether, drums, c/l., wks.	lb.	.15
Diethanolamine, drums, c/l., wks.	lb.	.23½
Diethylaniline, drums	lb.	.40
Diethylene glycol, drums, c/l., wks.	lb.	.14
Monobutyl ether, drums, wks.	lb.	.22½
Monoethyl ether, drums, c/l., wks.	lb.	.14½
Diethyl phthalate, drums, c/l.	lb.	.21½
Sulfate, tech., drums, wks.	lb.	.13
Diglycol oleate, light, bbls.	lb.	.17
Dimethylaniline, drums	lb.	.23
Dimethyl phthalate, drums, c/l., dlvd.	lb.	.20
Dinitrobensene, tech., drums	lb.	.18
Dinitrochlorobensene, bbls.	lb.	.14
Dinitronaphthalene, bbls.	lb.	.35
Dinitrophenol, bbls.	lb.	.22
Diphenyl, bbls., c/l., wks.	lb.	.15
Diphenylamine, bbls.	lb.	.25
Diphenylguanidine, bbls.	lb.	.35
Epsom salt, tech., bags	100 lbs.	1.80
Ether, concn., drums	lb.	.11
Nitrous, bots., 100 lbs.	lb.	.93
Ethyl acetate, 85-90%, tanks, frt. allowed	lb.	.11
Acetoacetate, drums, c/l., wks.	lb.	.37½
Bromide, drums	lb.	.50
Chloride, drums	lb.	.18
Formate, drums	lb.	.27½
Methyl ketone, drums	lb.	.09
Ethylene dichloride, drums, c/l., wks., frt. allowed	lb.	.0742
Glycol, drums, c/l.	lb.	.14½
Monobutyl ether, drums, wks.	lb.	.16½
Monoethyl ether, drums, wks.	lb.	.14½
Monoethyl ether acetate, drums, wks.	lb.	.11½
Monomethyl ether, drums, wks.	lb.	.15½
Feldspar, 20 mesh, bulk, wks.	ton	9.75
Film scrap colors, dk., cs., 1,000 lbs., E. wks.	lb.	.14
Fluorspar, 95%, bags, f. o. b. mines	ton	33.00
Formaldehyde, bbls., c/l.	lb.	.05½
Fuller's earth, bags, c/l., mines	ton	8.50
Furfural, tech., drums, contract, works	lb.	.10
Glauber's salt, bbls., c/l.	100 lbs.	1.05
Glycol phthalate, drums	lb.	.38
Stearate, drums	lb.	.26
Hexamethylenetetramine tech., drums	lb.	.32
Hydrogen peroxide, 100 vol., cbys., c/l.	lb.	.16
Hydroquinone, kegs	lb.	.90
Indigo, synth., liq., bbls.	lb.	.16½
Iodine, resubl., jars	lb.	2.00
Iodoform, drums, 100 lbs.	lb.	3.95
Iron acetate, N. F. IV, cbys.	lb.	.15
Iron chloride, tech., cryst., bbls., wks., frt. allowed	lb.	.05
Isopropyl acetate, tanks, frt. allowed	lb.	.07½
Lead acetate, white, broken	lb.	.12¾
Arsenate, bbls.	lb.	.11
Metal, N. Y.	1 lb.	.0650
Oxide, litharge, bbls., 20-ton lots,	lb.	.0790
Peroxide, powd., tech.	lb.	.23
Red, bbls., 20-ton lots	lb.	.09
Sulfate, bbls.	lb.	.0725
White, basic carb., bbls.	lb.	.0825
Lecithin, edible, drums, c/l.	lb.	.34
Tech., dms., c/l.	lb.	.28
Lime, live, chemical, bulk, wks.	ton	7.00
Lime-sulfur, dry, bags, c/l.	lb.	No prices
Lithopone, ordinary, bbls.	lb.	.04½
Magnesite, calcined, dom., bags	ton	80.00
Magnesium carbonate, tech., bags, c/l.	lb.	.06¾
Chloride, drums	ton	32.00
Fluosilicate, cryst., bbls.	lb.	.20
Oxide, light, bbls.	lb.	.26
Manganese chloride, bbls.	lb.	.14*
Dioxide, 85-90%, bbls., c/l., wks.	ton	74.00
Sulfate, anhyd., bbls., wks.	lb.	.10½
Mannitol, commercial, bbls., wks.	lb.	.35
Menthol, nat., cans	lb.	13.00
Mercury bichloride, cryst., drums, 50 lbs. or more	lb.	2.39
Mercury, flasks, 76 lbs., mines	flask	191.00
Meta-phenylenediamine, kegs	lb.	.65
Meta-toluylenediamine, kegs	lb.	.70
Methanol, synthetic, drums, frt. allowed, c/l.	gal.	.34½
Tanks, frt. allowed	gal.	.28
Methyl acetate, 97-99%, tanks	gal.	.09½
Chloride, cylinders	lb.	.32
Formate, l. c. l., drums	lb.	.89
Hexylketone, drums, tech., wks.	lb.	.60
Salicylate, drums	lb.	.35
Monoamylamine, drums, c/l., wks.	lb.	.61
Monobutylamine, drums, l. c. l., wks.	lb.	.51
Monoethanolamine, drums, wks.	lb.	.24
Naphthalene, crude, dom., 74 deg., bags, c/l., wks.	100 lbs.	2.75
Nickel salt, single, bbls.	lb.	.13
Niter cake, bulk	ton	16.00
Nitrobenzene, drums	lb.	.08
Nitrocellulose, alcohol-sol., bbls., wks.	lb.	.28
Nitrogen solution	unit	1.2158
Octanol, normal, drums	lb.	.85
Oil, castor, No. 3, tanks	lb.	.12¾
China wood, dms.	lb.	.40¼*
Coconut, crude, tanks	lb.	No prices
Cod, Newf., bbls.	gal.	.85
Corn, crude, tanks, mills	lb.	.12¾*
Cottonseed, cooking, bbls.	lb.	.16¾
Linseed, raw, tanks	lb.	.1300
Menhaden, crude, tanks, f. o. b. Baltimore	gal.	.6660
Neat's-foot, pure, bbls.	lb.	.19¼
Oiticica, bbls.	lb.	.25¼*
Oleo, No. 1, bbls.	lb.	.13¾
Olive oil, denat., bbls.	gal.	4.20
Edible, Calif., drums	gal.	4.25
Palm, Niger, bbls.	lb.	.0902*
Peanut, crude, tanks	lb.	.13*
Perilla, drums	lb.	.2460
Rapeseed, tax incl., bbls.	gal.	.15½*
Red, bbls.	lb.	.1330
Soy bean, crude, tanks	lb.	.12½*
Sperm, 38°, bbls.	lb.	.1301
Whale, bbls., natural, refined	lb.	.1070*
Ortho-dichlorobensene, drums	lb.	.06
Ortho-nitrochlorobensene, kegs	lb.	.15
Ortho-nitrotoluene, drums	lb.	.09
Ortho-toluidine, bbls.	lb.	.19
Para-dichlorobensene, drums, c/l.	lb.	.11
Para-formaldehyde, drums	lb.	.23
Paraldehyde, tech., drums	lb.	.12
Para-nitraniline, drums	lb.	.45
Para-nitrochlorobensene, drums	lb.	.15
Para-nitrotoluene, bbls.	lb.	.30
Para-phenylenediamine, bbls.	lb.	1.25
Para-toluidine, bbls.	lb.	.48
Paris Green, 250-lb. kegs	lb.	.24
Perchlorethylene, drums, c/l., wks.	lb.	.08
Phenol, drums, c/l., wks.	lb.	.12¾
Phenolphthalein, yellow, drums, ton lots	lb.	.80
Phenylethyl alcohol, bottles	lb.	2.10
Phloroglucinol, tech., tins, wks.	lb.	15.00
c. p., tins, wks.	lb.	20.00
Phosphorus, red, cases	lb.	.40
Oxychloride, 175-lb. cylinders	lb.	.15
Trichloride, cyl.	lb.	.15
Phthalic anhydride, bbls., c/l.	lb.	.14½
Platinum, metal, solid	oz.	36.00
Potash, caustic, solid, drums	lb.	.06¼
Potassium acetate, tech., bbls.	lb.	.28
Bicarbonate, gran., bbls.	lb.	.14
Bichromate, casks, c/l., wks.	lb.	.09½
Bromide, U. S. P., gran., bbls.	lb.	.27
Carbonate, 80-85%, calc., casks.	lb.	.06½
Chlorate, cryst., kegs	lb.	.11*
Chloride, tech., cryst., bgs.	lb.	.08*
Cyanide, drums	lb.	.55
Meta-bisulfite, bbls.	lb.	.18
Muriate, fert., bulk	K_2O unit	.53½
Permanganate, tech., drums	lb.	.19¾
Prussiate, red, casks	lb.	No prices
Yellow, casks	lb.	.17
Pyridine, denat., drums	gal	1.71
Pyrocatechin, c. p., drums	lb.	2.15
Quinine, 100-oz. cans	oz.	.97½
Resorcinol, tech., kegs	lb.	.68
Rochelle salt, powd., bbls.	lb.	.43½
Saccharin, drums	lb.	1.45
Salt cake, bulk, wks.	ton	15.00
Saltpeter, gran., bbls.	100 lbs.	3.20
Silica, amorph., 96%, 325 mesh, bags, c/l., wks.	ton	20.00
Silver nitrate, vials	oz.	.26½
Soda, ash, 58%, light, paper bags, contract, wks.	100 lbs.	1.05
Caustic, 76%, solid, drums, contract, wks.	100 lbs.	2.30
Sodium acetate, flake, 60%, bbls.	lb.	.05
Alginate, drums	lb.	.69
Antimoniate, bbls.	lb.	.15
Benzoate, U. S. P., bbls.	lb.	.46
Bicarbonate, U. S. P., powd., bbls., c/l., wks.	100 lbs.	1.85
Bichromate, c/l., wks.	lb.	.07½
Bisulfite, bbls.	100 lbs.	3.00
Bromide, U. S. P., bbls.	lb.	.27
Chlorate, cryst., bags	lb.	.06¼
Chloride, bags	ton	15.70
Cyanide, 96-98%, dom., drums	lb.	.14
Fluoride, white, 90%, bbls., c/l., frt. alld.	lb.	.08
Metallic, untrimmed bricks, drums, f. o. b. Niagara Falls	lb.	.15½
Metasilicate, gran., bbls.	100 lbs.	2.50
Napthionate, bbls.	lb.	.50
Nitrate, crude, bulk, works	ton	27.00
Nitrite, bbls.	lb.	.06¾
Perborate, bbls.	lb.	.14¾
Phosphate, disodium, cryst., bags, c/l., wks.	100 lbs.	2.55
Phosphate, trisodium, bags, c/l., wks.	100 lbs.	2.70
Picramate, kegs	lb.	.65
Prussiate, yellow, bbls.	lb.	.11
Silicate, drums, c/l., 40°	100 lbs.	.80
Silicofluoride, dom., bbls.	lb.	.09
Stannate, drums	lb.	.33½
Sulfate, anhyd., bags	100 lbs.	1.70
Sulfide, cryst., bbls.	100 lbs.	2.40
Solid, 60%	100 lbs.	3.15
Sulfocyanide, c. p., bbls.	lb.	.55
Thiosulfate, reg., cryst., bgs.,	100 lbs.	2.25
Tungstate, tech., kegs	lb.	No prices
Strontium carbonate, tech., bbls.	lb.	.25*
Nitrate, bbls.	lb.	.07¾
Sulfur, bulk, mines	ton	16.00
Chloride, drums	lb.	.03
Dioxide, commercial, cyl., wks.	lb.	.07
Tetrachloroethane, 50-gal. drums	lb.	.08
Thiocarbanilid, bbls.	lb.	.24
Tin, Straits	lb.	.52
Crystals, bbls.	lb.	.39
Oxide, bbls.	lb.	.55
Tetrachloride, anhydrous, drums, bbls.	lb.	No prices
Titanium dioxide, bags	lb.	.14¾
Toluene, tanks	gal.	.28
Triamylamine, drums, c/l., wks.	lb.	.98
Triamylborate, drums, l. c. l., wks.	lb.	.33
Tributylamine, drums, c/l., wks.	lb.	.78
Trichloroethylene, drums, wks., frt. allowed	lb.	.08
Tricresyl phosphate, tech., drums.	lb.	.25
Triethanolamine, drums, c/l., wks.,	lb.	.19
Triphenyl phosphate, barrels	lb.	.31
Tungsten, tech., powder	lb.	2.60
Urea, dom., 46 + % N., bags, f. o. b. wks. or seaboard	ton	80.00
Vanillin, 25-lb. tins	lb.	2.35
Whiting, comm., dry-grd., bags, c/l., wks.	ton	18.00
Xylene, 10°, tanks	gal.	.30
Xylidine, drums	lb.	.35
Zinc ammonium chloride, bbls.	lb.	.0565
Chloride, tech., fused, drums	lb.	.05
Dust., bbls., c/l.	lb.	.1035
Metal slabs, at N. Y.	lb.	.0865
Oxide, Amer., bags	lb.	.0725
Stearate, tech., bbls.	lb.	.30
Sulfate, cryst., bgs., c/l., wks.	100 lbs.	3.60

* Nominal.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ——→ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

CHEMICAL ENGINEER, draftsman, experienced in Ethyl Alcohol plant work, to assist in laying out plans and in erecting new plant. Later to continue in production supervision. Write full details and submit photograph.
Box 25–N–6, Ind. & Eng. Chem., Easton, Pa.

WANTED: INORGANIC Chemist, M.Sc. required; and Physical Chemist, M.Sc. required, Ph.D. preferred. Rank and salary dependent upon qualifications. State full qualifications, and salary expected. Write G. C. Brous, Chairman, Department of Chemistry, Hofstra College, Hempstead, New York.

RESEARCH DIRECTOR, Los Angeles independent commercial research laboratory. Ph.D. broad experience, training in biological chemistry particularly foods, nutrition and pharmaceuticals. Good character and personality essential. Married man or mature woman. Give training, experience, nationality, draft status, age and personal data, also recent photo.
Box 94–TP–6, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST. Company in middlewest manufacturing agricultural products and serving National Defense on food industries desires research chemist with fundamental training in chemical and physical sciences. Excellent opportunity for woman or one whose status can be considered permanent. State age, education, experience, salary desired and other pertinent information.
Box 12–N–7, Ind. & Eng. Chem., Easton, Pa.

GRADUATE RESEARCH assistant ($2000) in field of colloids; war effort; academic credit. Transcript of record and testimonials to J. W. McBain, Chemistry Department, Stanford University, Calif.

RESEARCH FELLOWSHIP in physical chemistry available, beginning September 1st, 1942. Eighteen hours course work can be taken per year towards Ph.D. Stipend $70 per month for 11 months. Applicants should have M.S. or equivalent. Submit applications to Thos. De Vries, Dept. of Chemistry, Purdue University, Lafayette, Ind.

ANALYTICAL CHEMIST, to develop methods for new organic chemicals, with manufacturer of fine chemicals in East. Recent Ph.D. or man having industrial experience with newer methods and instruments preferred. Send complete details with first letter, including photograph, draft status, religion, availability, personal data, education, and industrial experience.
Box 19–N–7, Ind. & Eng. Chem., Easton, Pa.

GRADUATE FELLOWSHIPS still available. Large eastern university. Half tuition and $700 00 cash. Recipient may carry nine credit hours of study but must devote half his time to assisting. Young women considered.
Box 22–N–7, Ind. & Eng. Chem., Easton, Pa.

RESIN CHEMIST. Recent graduate preferred. Research work in the field of urea-formaldehyde, phenol-formaldehyde resins. Opportunity for interesting work and advancement. Organic chemistry essential. Practical background helpful but not necessary. Give complete details in application, recent snapshot, salary expected. Location New York state small town.
Box 23–NP–7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL engineer for plant development and research work on various chemical problems, principally organic. Opportunity with aggressive organization with excellent possibilities. In replying give particulars regarding training, practical background, draft status, and salary desired. If possible, include snapshot. Location mid-west.
Box 29–N–7, Ind. & Eng. Chem., Easton, Pa.

WANTED: CHEMIST must be competent and graduate of acknowledged school, to handle laboratory work involving the use of rubber extenders, synthetic rubber and synthetic resins. Position requires man with initiative and ambition. Please give complete information together with salary desired and draft status all of which will be treated confidentially. Location, Middle West.
Box 32–NP–7, Ind. & Eng. Chem., Easton, Pa.

WANTED: ORGANIC chemist preferably Ph.D. caliber experienced in proteins, particularly zein. Also chemist experienced in resins or emulsions. Describe full detail training, personal data. Salary of $3500 to $5000 depending upon experience.
Box 39–NP–7, Ind. & Eng. Chem., Easton, Pa.

DEVELOPMENT CHEMISTS AND Chemical engineers wanted for Pilot Plant production, organic field. Openings for experienced men as well as recent graduates. Metropolitan area.
Box 41–NP–7, Ind. & Eng. Chem., Easton, Pa.

WANTED: EXPERIENCED milk chemist for large Southern dairy. Do not apply unless you have milk experience. Irvindale Farms, Inc., Atlanta, Georgia.

CHEMICAL TECHNICIAN for analytical work in hospital. Female preferred. Salary $90 per month to start.
Box 49–N–7, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST for literature work: Wanted by large research laboratory; good training in organic chemistry required, master's or doctor's degree preferred; reading knowledge of French and German. Work involves abstracting, searching and indexing.
Box 55–NP–7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. The Research Department of a food organization in the East will welcome applications from chemical engineers of outstanding qualifications. Please submit college record, experience, personal data and photograph.
Box 56–NP–7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER or chemist with experience in development and manufacture of molding compositions, preferably thermosetting. Location in Midwest. State salary expected and draft status. Give details of education and past experience.
Box 58–NP–7, Ind. & Eng. Chem., Easton, Pa.

SUCCESSFUL SOUTHERN chemical company desires man for original research work in organic chemistry. Individual will be able to work largely on own initiative, and position offers excellent opportunity. Give full particulars, including draft status.
Box 64–NP–7, Ind. & Eng. Chem., Easton, Pa.

ENGINEERS WANTED: Chemical or Mechanical with minimum one year oil refinery plant operation or maintenance experience. Require University Engineering School graduate with basic knowledge principles fluid flow. To work on process flow sheets, equipment selection and general handling oil refinery Defense Contracts as assistant to senior engineers. No aliens or men engaged in Defense work considered. Opportunity up to individual. In reply state experience, education, draft status, slary expected.
Box 70–NP–7, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL ENGINEER wanted by nationally known Food Company. Excellent opportunity for the right man. State experience in detail and salary desired.
Box 71–NP–7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, man or woman for control and analysis laboratory New York State. Salary $150 per month. State age and qualifications and enclose photograph.
Box 78–NP–7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH ASSISTANTSHIP or graduate student fellowship available at large Eastern Canadian university. New research project. Bachelor degree and preferably one year research experience in organic or biochemistry required. Applications considered from men and women. Give full information, references, and photograph.
Box 80–N–7, Ind. & Eng. Chem., Easton, Pa.

FOOD TECHNOLOGIST. An Eastern food manufacturer is interested in receiving applications from men with exceptionally good records to serve as junior chemists. These positions present prospects for advancement for men of the right qualifications. Information concerning training and experience, personal history and small photo should accompany letter of application.
Box 57–NP–7, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

YOUNG CHEMICAL engineer, B.S.Ch.E. '42, desires position connected with defense. Part time and summer work in food, wax paper, and plastic coatings. Undergraduate thesis in petroleum research. High scholastic standing. Available June 2.
Box 17–N–6, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST M.S. Michigan. Single, 41. Twelve years' experience in explosives, rubber, steel, chemicals, paper. One year government explosives inspector. Had charge of two laboratories. Eastern U.S.A. wanted but will consider other locations. Performed research on inorganic problem. Prefer war work.
Box 38–N–6, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 890)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Wanted Continued)

PETROLEUM CHEMIST and Technologist, Ph.D. 1931, now employed, available reasonable notice. Age 40, married, two children. Ten years' experience mainly on lubricants; less on gas reactions and motor fuels. Publications. Prefer research and development work.
Box 15-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D. Unusual varied and sound background. Research, new product development, productions. Now employed. Available on reasonable notice.
Box 24-T-6, Ind. & Eng Chem., Easton, Pa.

CHEMIST, BIOCHEMIST, M.A., Sc D., assistant professor of biochemistry, now employed, wishes research, teaching, or responsible industrial position, reasonably permanent. 10 years of laboratory research and teaching in biochemistry, nutrition. 37 publications. Married, age 36. Status 3-A. Member four national professional societies.
Box 26-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, university graduate, twenty years excellent record in research, development, service and sales; publications, patents, sales and advertising literature, new products and new uses; desires active and responsible position; references from all employers: listed in American Men of Science, 3-A draft classification.
Box 30-T-6, Ind. & Eng. Chem., Easton, Pa.

ASSISTANT PROFESSORSHIP in chemistry wanted by chemist, Ph.D., now holding responsible post in industry but who prefers teaching with chance for independent research. Experienced teacher. Well trained in organic, physical and analytical chemistry. Many publications and patents. Sigma Xi. Age 35, married.
Box 38-T-6, Ind. & Eng. Chem., Easton, Pa.

TEACHER, PH.D. Well qualified in physical, analytical, inorganic and industrial chemistry, chemical microscopy, etc. Thirty years' experience, half teaching, half industrial research, consulting, testing. Many publications. Employed. Available summer or fall.
Box 58-T-6, Ind. & Eng. Chem., Easton, Pa.

APPLIED RESEARCH. New trade products for 11 years; developed in food, biological and pharmaceutical laboratory investigations. Experimental process pilots for vitamins, hormones and amino acids also published scientific reports. By-product and food chemicals for market formulae. Control and sales requirements with clinical applications of infant food preparations. Trained (M.S., Ph.D.) and experienced manager seeks active post associated with food institute or industry in New York area. Age 37. Family, 3-A, service waiver not granted.
Box 80-T-6, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. 1936, wishes teaching or research position in college or university. Graduate major, biochemistry; minors, general chemistry, bacteriology, physiology. B.S. degree in pharmacy. Five years teaching in medical school. Agr. Exp. Station experience. Publications on metabolism of minerals, and of amino acids, clinical chemistry. Married, age 31. Draft Class 3.
Box 99-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, BIOCHEMIST, Teaching position Sc.D. Johns Hopkins; M.S. Chicago, 14 years' experience teaching all phases of chemistry; 6 years as head of departments. Woman with ability to inspire and direct men and women. Seeks a better position.
Box 10-N-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH DIRECTOR

or Equivalent, Ph.D. Catalysis, Synthesis, Colloid Chemistry. Outstanding experience in Research, Consulting and Industrial Processing. Now industrial executive and consultant. Due to war changes desires connection with progressive organization, or university post combined with consulting activity. Married.

Box 11-NP-7, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL COLLOIDS. M.S. M.I.T. Married. Native Stock. Draft exempt. 12 years' experience in charge of development research with one concern at good salary. Loyal, hard-working, enthusiastic. National reputation. Desires change to laboratory where temperature is less than 120° F. all summer. If you have a somewhat cooler laboratory in the New York-New Jersey area and have problems concerning paper, printing emulsions, aqueous coatings, adhesives, wetting agents, or war products made therefrom, we should get together. Can conduct research; develop products through to plant stage; write, talk; supervise technical reports; relieve busy executive who would like to summer in Maine and winter in Florida. Consulting or part-time position also considered.
Box 14-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Eastern University. Fourteen years' diversified fundamental and practical research on cellulosic and synthetic film and filament forming materials on laboratory, semi-works and plant scale. Employed entire period by large manufacturer of chemicals and chemical products Patents. Age, 44, married dependents, Protestant, location immaterial, available on short notice.
Box 15-N-7, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., desires work in research or development. Researches in kinetics, high vacuum, electrochemistry. Now working in radio tube factory, thermionic emission, production development of direct emission filaments. Good background in physics, mathematics. 29, married, English born, American citizen. Phi Lambda Upsilon, publication.
Box 18-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST—Ph.D. Fourteen years' diversified industrial experience in control, development, initiating, planning, conducting, and supervising modern chemical research on resins, textile chemicals, azo dyes, surface-active agents, pharmaceuticals. Patents and publications. Administrative ability. Seeks new permanent, responsible position. Married.
Box 24-N-7, Ind. & Eng. Chem., Easton, Pa.

AGRICULTURAL and MANUFACTURING Chemist M.S. Ch.E. 1936. Research on liquid fertilizers, vitamin and hormone sprays, minor elements. Production of waxes, fungicides, preservatives. Age 27, employed, 3A.
Box 25-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC DEVELOPMENT or elementary laboratory research, from which to advance, desired by unemployed Quaker, 26. Married. 3A. Strong in theoretical organic, inventiveness and business administration. Scholastically high. Untrained in languages, advanced laboratory preparations and analytical. Chemical patent attorney '40-'42. Graduate organic '37-'40.
Box 28-N-7, Ind. & Eng. Chem., Easton, Pa.

TEACHER, RESEARCH worker: Ph.D. Majors: Physical chemistry, chemical engineering. Twelve years' teaching these with inorganic, analytical chemistry, metallurgy, microscopy, etc. Sixteen years' industrial research, consulting, testing. Numerous publications.
Box 31-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—M.Ch.E. Three years' of experience in distillation equipment design. Interested in production or research and development in plastics or synthetic rubber. Ability to direct personnel, and create new methods. War work preferred.
Box 33-N-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH BIOCHEMIST, Ph.D. 7 years' experience in isolation of organic compounds from plant material. Publications. Teaching experience. Can use the polarizing microscope for determination of crystallographic optical properties. Married. Employed but available on short notice. Desires permanent position in isolation and identification of organic compounds.
Box 34-N-7, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL and INORGANIC Chemist, Ph.D. Cornell, with five years of teaching experience in general chemistry and about ten years' of research in insecticides, fertilizers and related subjects, experience in translating and abstracting, with publications and patents, desires teaching or research position.
Box 35-N-7, Ind. & Eng. Chem., Easton, Pa.

PRODUCTION CHEMICAL engineer, exceptional background, Ph.D. 17 years' experience in research plant and organization; Potass Chloride, Sulphate, Magnesium Chloride, Sulphate, Bromine, Cellulose Products, Edeleanu Oil Refining Process, Polishes, Dyes and Lacquers. Speaks four languages. Employed but looking for future advancement. Excellent references.
Box 40-N-7, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.S. Six years' of excellent diversified experience in pharmaceutical industry. Research, new product development and formulation, analytical control methods. Particularly interested in colloids, emulsions and surface chemistry. Resourceful, industrious. Prefer Eastern location. Age 30, married, draft deferred.
Box 42-N-7, Ind. & Eng. Chem., Easton, Pa.

Ph.D., ORGANIC, physical, and biological chemistry. Experienced in construction and use of packed columns and molecular stills. Ph.D. research on purification of esters. Desires position on research staff of progressive company or university. Citizen, Gentile, married, age 28.
Box 43-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., also S.B. in Chemical Engineering, desires position in synthetic rubber field. Five years' experience as rubber chemist, and eight years' as industrial organic chemist in research, process development, and production. Now employed in a non-defense industry, but want to make a change offering greater opportunity. Married.
Box 47-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, CHEMICAL Engineer. Fully qualified in all phases of refining of edible oils and fats, hydrogenation, fatty acid distillation, synthetic esters, etc. 18 years' experience. Competent to assume full responsibility of production, or to undertake a program of research and development along these lines. Married, Protestant and American citizen.
Box 50-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 1941, leading university, Experienced in organic syntheses, micro-analyses, organo-metallic plastics. Graduate assistantships, one year post-doctorate fellowship, Sigma Xi. Single, age 24, draft 2-A. Available immediately.
Box 51-N-7, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. August, 1942, M.Sc. organic chemistry. Bacteriology minor. Training in organic and biochemical preparations, microanalysis, spectroscopy. Research in human fat and fat chemistry methods. Teaching experience in photography. Age 25, single, Class 2-A. Desire industrial research or development.
Box 52-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. B.S. 1939. Draft deferred (4-F). Available immediately. Three years' research and development work on pigments and organic chemicals. Patent. Pilot plant experience. Excellent background in organic synthesis and analysis. Personable, single, age 25. East preferred.
Box 53-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. June 1942, age 22, draft 2-A, enemy alien. Education included general analytical, advanced quantitative and organic qualitative chemistry, advanced organic and physical chemistry; minor in physics and mathematics.
Box 54-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEERING executive, 12 years' successful experience large petroleum and alcohol companies, synthetic organics. Process design, development engineer, director of engineering. 5 years' top executive and administrative positions. Active member Institute. Available short notice. Married. Minimum salary, permanent position $7500.
Box 59-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.S. 1938, Postgraduate work. Three years' industrial experience in research, photography, textiles. Presently employed, desires work more directly connected with war effort. Age 30, married, draft classification 3-A. Location in or near greater Boston preferred.
Box 62-N-7, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. 1942. Vitamins and nutrition. Good foundation in organic, physical, and physiology. Research on B complex and protein requirements. Publications. Five years' teaching biochemistry, general and physical chemistry. Desires research or teaching.
Box 63-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D., 1941, from large midwestern university available for teaching or industrial research position. Experience in teaching of general, organic, and analytical chemistry. Industrial research experience with synthetic resin coatings. Major, physical chemistry; minors, organic and mathematics. Honor Societies. Publication. Available on short notice.
Box 65-N-7, Ind. & Eng. Chem., Easton, Pa.

MIDWEST UNIVERSITY instructor. Also decade of college experience (Dept. head). Specialty, Organic. M.Sc. from eastern university; minor, physical. Trained in chemical microscopy; experienced with pre-med students; some biochemical background; year of recent graduate study; published articles. Available September for research, industry, teaching.
Box 66-N-7 Ind. & Eng. Chem., Easton, Pa.

RESEARCH or TEACHING position wanted by organic and physical chemist. Ph.D. Extensive experience in research and teaching at prominent university (Ass't Professor) and research institutes, teaching graduate courses and directing Ph.D. researches. Numerous publications in organic and physical chemistry. Research involves absorption and emission-spectra, fluorescence, Raman-spectra, polarography, optical activity, calorimetry, etc., and their applications to organic and biological problems. Organic syntheses, qualitative and quantitative organic microanalysis. Administrative ability. First citizenship papers. Age 42, married. Available September 1. Location immaterial.
Box 67-N-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, Ph.G., B.S. graduate work. Nine years experience developing new products in fields of pharmaceuticals, cosmetics, vitamins and food products; supervision and administration. Originality, initiative, imagination justify minimum salary $4200. Age 33, married, child, status 3-A; Native Virginian.
Box 68-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, BIOCHEMIST, Ph.D. 1942. Major biochemistry, minor physical. Four years' research experience with proteins. Married. Draft deferred. Age 28. Available immediately.
Box 69-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. 1941, desires position in production or research. Draft deferred.
Box 72-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, EXPERIENCED; products development in oil-gum-resin-pigmentation field, technical sales, coatings. Specialist in resinous fusible inks. Also production supervision and factory maintenance in organic chemicals manufacture. Age 35, American, Protestant. Desire position with reputable firm in defense industry.
Box 74-N-7, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 891)

(Situations Wanted Continued)

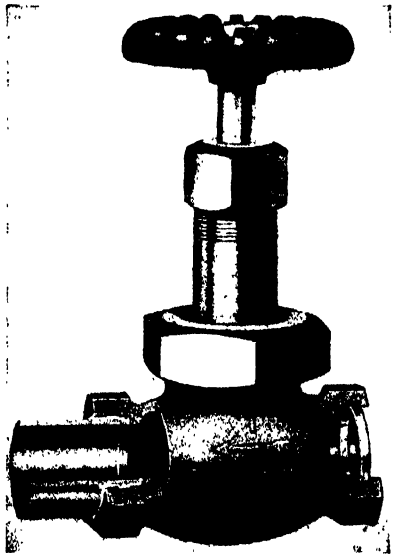
BIOCHEMIST, Ph.D. with Chemical Engineering degree. Five years' industrial experience in foods, nutriton, vitamin assays, spectrophotometry, enzymes. Age 30, married, draft deferred. Employed but available on short notice.
Box 75-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S., desires research or development position. Experience. Ergosterol, Hydroxynaphthalenes, Amino-acids, Caffeine, Aliphatic Diazo-compounds, Phenolic Condensations. Familiar with organic microtechnique, Micro-Biological work, Electrospectrophotometry, pH control. Publications. Draft deferred.
Box 76-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC MAJOR with minor in physical chemistry, Ph.D., Sigma Xi, Phi Lamda Upsilon. Publications. Have twenty years teaching experience in college and university. Experience in food analysis. Now engaged in teaching, private research and textbook writing. Any good opportunity.
Box 82-N-7, Ind. & Eng. Chem., Easton, Pa.

FOOD and BIOCHEMIST, Ph.D., with 14 years' of industrial plant and laboratory experience in foods, enzymes and fermentation, including research work. Can prove successful management. Desires responsible position in production or research with progressive company. First class references. Married.
Box 83-N-7, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED (NONMEMBERS)

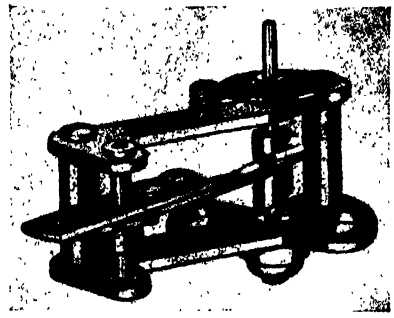


ANALYST SPECTROGRAPHIC: White, male, just completed 16 weeks ESMDT Spectroscopy course, U.S.C., no experience, married, 56, B.S. '09. Location immaterial for war industry. Salary your schedule.
Box 82-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S., M.I.T., 1937, wants position. Two years' petroleum research and development experience, three years' maintenance engineer. Draft classification 4-F.
Box 37-N-7, Ind. & Eng. Chem., Easton, Pa.

Industrial News

CONTINUED FROM PAGE 886



New Type of Valve

THE Fairbanks Co., New York, N. Y., is introducing a line of Faircoseal bronze valves which contain pre-inserted rings of Sil-Fos silver brazing alloy in the port openings instead of threads. With this design, valve and pipe can be easily brazed together into a one-piece piping assembly by the application of an oxyacetylene flame. When valves are connected to brass, copper, or copper-nickel pipe, a "Silbraz" joint is formed.

New Gage

THE Certified Gauge and Instrument Corp., Long Island City, N. Y., has developed, for use in pressure indicating gages, a new and improved type of gearing in the form of a patent cam and roller Movement. The movement employs a sector-shaped driving cam and a driven helical roller. One end of the pivoted cam is linked to the tip of the Bourdon tube, while the other end is aligned with and fits freely into the thread of the roller. A hair-spring limits the pointer of contact between cam and roller to only one side of each element, and prevents backlash. The cam and roller movement provides smooth and constant transmission of motion from Bourdon tube to pointer. As the edge of the cam is in constant contact with the wall of the helical thread, there is no lag nor lost motion between these parts.

Unique with the Certified gages is a recalibrating mechanism by means of which it is possible to reset the pointer to zero to correct any drift or set of the Bourdon tube. Such recalibration disturbs neither the cam and roller movement nor the Bourdon tube—the angularity of the linkage remains unchanged. A turn of the Adjust-a-matic screw merely causes the freely-mounted pointer shaft to rotate sufficiently to return the pointer to the proper position.

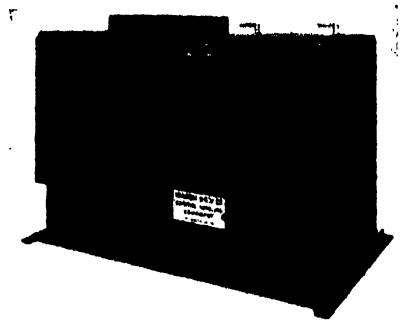
Correct recalibration is afforded throughout the dial range, and is ensured when this recalibrating mechanism is incorporated in the Certified gages.

Electrical Testing Panels

STANDARD panels, which provide a speedy and efficient method for production testing of all types of electrical equipment, are available through The Standard Electric Time Co., Springfield, Mass. They provide great flexibility of electrical connections, so necessary in research and development laboratories.

Hercules Detroit Office Moved

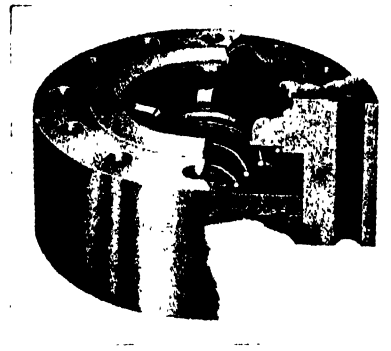
THE Detroit, Mich., office of Hercules Powder Co. has been moved to enlarged quarters in the Fisher Building. The office now includes the Cellulose Products Department, the Naval Stores Department, the Synthetics Department, and the Paper Makers Chemical Department.



Philip F. Robb was recently transferred to Detroit from Wilmington, Del., to act as manager of the office.

Hyper-Reset

A DEVELOPMENT in the field of control engineering has been announced by The Foxboro Co., Foxboro, Mass., under the name of Hyper-Reset. This is not an instrument or a mechanism, but a control function, available in the newly-designed Model 30 Stabilog Controller for application where process-lag is considerable. Its importance is demonstrated by tests in which Hyper-Reset consistently re-established process stabilization, following an upset, in one quarter of the time and with only one half the upset effect as compared with a similar controller having only the usual reset.



The theory and performance of Hyper-Reset are fully explained in Bulletin A-330, and copies will be sent on request to the company.

Automatic Weighing Scale

AN AUTOMATIC weighing scale designed for rapid and accurate handling of coal and other free-flowing bulk materials is offered by the Beaumont Birch Co., Philadelphia, Penna. An outstanding feature is a vibrating metal feeder deck which conveys the material from feed hopper to weighing hopper, thereby eliminating rubber belts, pulleys, and rotating mechanism.

Check Valves

THE Williams Gauge Co., 2031 Pennsylvania Ave., Pittsburgh, Penna., announces an improved line of check valves which are furnished in a wide variety of metals and sizes. Designated as the Williams-Hager Flanged Silent Check Valves, they are manufactured of bronze, cast iron, steel, stainless and Monel metal for pressures varying from 150 to 2,500 pounds to meet American Standard. Sizes range from 1 to 20 inches, inclusive.

Alkali-Resistant Paint

THE Harrington Paint Co., Inc., 1630 Collamer Ave., East Cleveland, Ohio, has developed a paint said to withstand caustic liquor of 70 and more per cent concentration. The paint, Rust Eeter No. 66, dries in less than an hour and is practically inert chemically. Samples may be obtained from the company.

Fire Extinguisher

A PUMP-TANK fire extinguisher developed by the Buffalo Fire Appliance Corp., 44 Central Ave., Buffalo, N. Y., meets industrial requirements for combating incendiary bombs. It can be supplied in two capacities, 2.5 and 5 gallons.

MISCELLANEOUS

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

PRIVATE LABORATORY, advisory and research service in enzyme chemistry. General analytical work by competent staff. Box 685, New Brunswick, N. J.

REWARD FOR information leading to the location or return of a Zeiss Microscope, Stand ESB No. 260732, Triple Objective and Cardioid Condenser, taken from our laboratory.
Box 73-N-7, Ind. & Eng. Chem., Easton, Pa.

WANTED TO purchase. Copy of "Methods of the Chemists of the United States Steel Corporation for the Sampling and Analysis of Gases" issued by the Carnegie-Illinois Steel Corporation. State price and condition.
Box 13-N-7, Ind. & Eng. Chem., Easton, Pa.

WANTED: CHEMICAL Abstracts, Volumes 1 to 9, inclusive. Also first decennial index.
Box 27-N-7, Ind. & Eng. Chem., Easton, Pa.

WANTED: Hansen, Max—"Der Aufbau der Zweistofflegierungen." Berlin, Springer, 1936. Quote price and condition. Iowa State College Library, Ames, Iowa.

WE will PLACE orders for special organics and inorganics with competent chemist who has access to equipped laboratory. We need Maleic anhydride, asparagine, tryptophane, glutamic acid, levulose, xylose, boron amorphous, gadolinium oxide, caesium and rubidium chloride.
Box 46-N-7, Ind. & Eng. Chem., Easton, Pa.

WANTED to BUY: Polarimeter in good, usable condition, readable to 0.01 degree circular. Please state make, type, and price.
Box 48-N-7, Ind. & Eng. Chem., Easton, Pa.

WANTED: Water bath and shaking mechanism for Barcraft Washing respirometer, with or without manometers. Department of Bacteriology, College of Medicine, 477 1st Ave., N. Y. C.

WANTED: CRITICAL Laboratory equipment. Not bargains. We are interested to obtain the following critical laboratory equipment at the very best market or regulation price. Do not hesitate to offer us all or one of the many items we list or a complete laboratory no matter how large or where located. We are America's largest used equipment firm specialising in scientific equipment only. We need very urgently for a number of our clients who are doing war work, Abbe Refractometers, Polarimeters, Metal Testing Instruments and Microscopes, Microscopes of all Kinds, Cameras, Binoculars and Accessories, Measuring Instruments, Precision Tools of all types, Engineering Materials, Balances, all Instruments with Bureau of Standards Certificates, Slide Rules, Drawing Sets, Lenses, Weston, L & N and other A-C Voltmeters, Ammeters, Millammeters, Microammeters, Wheatstone Bridges, Potentiometers, Standard Cells, Portable Testing Instruments, etc. Quarts Instruments; or what have you? Write or wire us full information on what is available. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: J.A.C.S. Vol. 23-Vol. 53 $250. Ind. & Eng. Chem. Vol. 1-Vol. 33 incl. Analytical Ed. Vol. 1-13, $125.00. Chem. Abstracts Vol. 1-Vol. 35 $350. All unbound, excellent condition. Location N. Y. C.
Box 20-N-7, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journals Society Chemical Industry, 1907-1923; Industrial Engineering Chemistry, 1924-1926; American Phar. Assoc. Year Books, 1912-1933; Proceedings, 1899-1911; Collective Index, 1903-1925; Chemical Engineer (Chemical Age), 1905-1915.
Box 21-N-7, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Drum, revolving steel, 18 feet long, 3 feet 10 inches outside diameter, 3" refractory lining (can be removed). Variable speed drive, drum speed 4 to 14 R.P.M. Automatic feed. Used few hours only. Price $2250.00. Mounted on steel skids. Washburn & Granger, Inc., 53 Park Place, New York.

FOR SALE: Second Decennial Index, bound; Third Decennial Index, unbound. Both in good condition. Make me an offer. Charles N. Ott, Oskaloosa, Iowa, Route 4.
Box 38-N-7, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: All uranium, titanium, vanadium, zirconium, molybdenum, tantalum, tungsten and tellurium salts. All azides, borides, calcides. Gallium, germanium, indium, metals or salts. All optical crystals, bearing sapphires. Fluorescent pigments, iron carbonyl.
Box 45-N-7, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Newly acquired critical laboratory equipment. Ready for immediate delivery, fully guaranteed, priced in strict accordance with government price ceiling or lower where ever possible. Subject to prior sale. (2) Schmidt & Haensch Precision double wedge Saccharimeters for 200 and 400 mm. tubes; (1) Dubosq Precision Polarimeter with 175 mm. circle for tubes to 500 mm. read to 1/100 degree; (3) B & L Dubosq Colorimeters for 500 mm. complete with cups and plungers; (2) Spencer 3 Objective Binocular Microscopes; (5) B & L Microscopes 3 Objectives including oil immersion; (5) C. Becker Fine Analytical balances newly reconditioned; (50) Pulp Balances 150 gr. Capacity 1 mg. sensitivity in fine polished mahogany cases (never used) with drawer, sliding Cointerpoised door of standard American make purchased by us from one of the Government Departments before Dec. 7th ready boxed for immediate shipment specially priced at $27.50. Order as many as you need while we still are able to offer them. (2) Freas 12 × 12 drying ovens, Watson, Stillman 75 Ton Hydraulic Press 12 × 12, Horizontal Steam or gas heated Autoclaves, Incubators, Water Stills, Hanovia Quarts Ultraviolet Lamps, Beckmann Thermometers, Electric hot plates 3 heat, (3) International Centrifuges, Edwards Gas Density Balance and hundreds of other critical laboratory items. Let us help you break the bottleneck on your laboratory needs. Write or wire us your needs. We will quote immediately if available. The Laboratory Exchange, 24 E. 21st Street, N. Y. C. Algonquin 4-38791.

FOR SALE: "American Chemical Journal" (Remsen's): Vols. 1-50 (1879-1913); "American Institute of Chemical Engineers, Transactions": Vols. 1-27, bound; "American Association of Petroleum Geologists, Bulletin": Vols. 1-23 (1917-1939); "Berichte der Deutschen Chemischen Gesellschaft": Vols. 18, 19, 21-24, 32, 35-46; "Chemical Abstracts": complete bound set: Vols. 1-34 (1907-1940), with First and Second Decennial Indexes, bound, splendid. "Journal, Chemical Society of London": 1890-1940. A. Calvert, 221 Seaman Ave., New York, N. Y.

FOR SALE: Chemical Abstracts. 1916-1934, $130; 1917-1934, $120; 1917-1933, $115. Individual years 1917-1921, $12; 1922-1926, $10; 1927-1933, $7. Single copies 1908-1940 available. Decennial Subject Index, 3 volumes, 1917-1926, unbound, $35. N. Klein, 113 Fourth Ave., N. Y.

Durez 11934

A NEW high-impact plastic of the phenolic type was recently announced by Durez Plastics & Chemicals, Inc., North Tonawanda, N. Y. It has a macerated fabric filler and consequently is not readily preformed. It has an impact strength of 2.0 and a specific gravity of 1.44. It is said to have a very good cure cycle for a material of this type and is available in black or brown color.

Oil Well Cased with Fiber Pipe and Concrete

THE world's first oil well cased with fiber pipe and concrete as a substitute for steel is now in successful operation in southern Illinois, and experts in the industry believe it is the beginning of increased oil production in all parts of the United States, especially in the shallow-well fields. The announcement was made by the Fibre Conduit Co., Orangeburg N. Y.

THE Keystone Carbon Co., St. Marys, Penna., manufacturer of precision molded products, is completing a large program of expansion, including plant and production facilities.

Arside Cream

DANGERS arising from the use of arsenic or arsenious compounds and lead or lead compounds, either from contact or from their fumes, have long been a matter of common knowledge. The H. W. Stover Co. of Oakland, Calif., has recently announced the manufacture of Stover Arside Cream, a protective cream compounded especially for protection against these two dangerous elements. The company says the cream has been tested for more than three years under actual working conditions. Like its companion product, Stover Protective Cream, the Arside Cream is applied to all exposed skin surfaces in the form of a thin, invisible film. It is removed with soap and water.

Kem Liquid Glue

KEM Liquid Glue 344 is a liquid animal hide glue for industrial uses. Having properties similar to fish glue, it contains no casein or vegetable or fish glue and is free from objectionable odor.

E. H. SARGENT & Co., Chicago, Ill., has announced the establishment of a Michigan Division in Detroit, with complete sales office and warehouse service.

Conveyor Belt Repair

MANY plants producing war materials are said to be using a new rubber plastic product on conveyor belts, pulleys, and other equipment to keep production lines going. The material, a puttylike substance, made by the So-Lo Works, Cincinnati, Ohio, contains a very small proportion of crude rubber. When spread on a conveyor belt, it repairs holes and worn spots, making it possible for the plant to keep producing without loss of time or replacement of equipment now in service.

Variable Speed Transmission

THE Reeves Pulley Co., Columbus, Ind., offers a special design of the Reeves variable speed transmission, enclosed design, equipped with built-in chain reducer, and with the output shaft in exact alignment with the input shaft. The chain drive operates in a bath of oil.

THE H. K. Porter Co., Pittsburgh, plans to open another plant in Pennsylvania, expanding facilities in the war effort. The company's regular products include locomotives and chemical processing equipment.

Chemical Detection of War Gases for Civilian Defense

THEODORE F. BRADLEY, Stamford Research Laboratories, American Cyanamid Co., Stamford, Conn.

PROTECTION of civilians against possible enemy attack presents urgent problems in which chemists are vitally interested. Members of the Western Connecticut Section of the AMERICAN CHEMICAL SOCIETY are active in solving chemical aspects of these problems in cooperation with the Stamford, Conn., Auxiliary Police and other local organizations. Having the staffs and facilities of two great research organizations, American Cyanamid Co. and Air Reduction Co., to draw from, as well as other members of the section, we have been able to do more than most communities. In addition to routine drills and small arms practice required of all members of the auxiliary police, the chemists have organized gas drills, classes of instruction, and part-time laboratory projects.

Quick and reliable detection and identification of chemical warfare agents have long concerned military authorities, and today this matter has become of equal concern to those who are charged with civilian defense. "Sniff sets" of the common war gases were prepared and used for instructional purposes. The majority of our group agreed that trained noses are essential for those assigned to gas-sentry duties, but nevertheless we felt it necessary to back up the sense of smell by analysis. Although the human nose is unequaled for sensitivity to many agents, several factors discourage complete reliance on the sense of smell. These are variations of the sense of smell among individuals, lack of odor of some of the war gases, ease of masking or disguising odors by blending agents, and probable use of new or mixed gases. Prompt, accurate identification is vital in selecting protective devices, in applying first aid and medical treatment, and in choosing appropriate decontamination procedures. All of these depend upon the kind of agents encountered.

Detection and identification at the scene of the attack are thus imperative. This precludes the use of elaborate laboratory equipment and methods, and demands the ultimate of simplification without sacrifice of scientific reliability. A major problem indeed!

This analysis of the situation led the chemists affiliated with the Stamford Auxiliary Police to undertake an investigation of suitable methods and equipment for this type of work and to organize detection and identification services for their city. The analytical project was initiated with a survey of the literature and then progressed to an experimental investigation of known methods, selection of the most promising for immediate use, and finally modification and improvement of these for the present purpose where possible. Although this work is still in its early stages and has thus far chiefly utilized known methods, sufficient progress has been made to warrant this preliminary report. Others interested are urged to communicate with the author if they can suggest better methods or otherwise assist in this work.

Smokes: Jackson, K. E., *Ibid.*, **25**, 67 (1939).

Organization and Equipment of Gas Identification Service

Three chemists were provided with all of the chemical apparatus, reagents, and the portable aspirator described later and were ordered to report to a central station at the first warning of an impending air

raid. In case of a gas alarm, police cars equipped with two-way radios were placed at their disposal for rapid transportation to any affected area. The majority of the chemists were posted during a raid alarm at strategic areas as gas sentries and were provided with test papers 1 to 6, inclusive, one 10-cc. vial of reagent No. 5, and one vial of distilled water, these being conveniently carried in cartridge belts. Only under special circumstances were the gas sentries permitted to call out the mobile first aid and decontamination services, this authority being primarily delegated to the central gas-identification squad.

Owing to the lack of government-issued gas masks and gas-protective clothing the chemists borrowed gas masks from their industrial employers and improvized reasonably satisfactory clothing. Oil-skin jackets with attached hoods and oil-skin trousers, all with drawstring fastenings, were secured from the J. F. Carter Co., Beverly, Mass., and from the Goodall Rubber Co., New York. Heavy rubber boots and gloves were purchased locally.

Portable Aspirator

An aspirator was built to operate without hand pumping or electrical connections and without personal attendance for an appreciable time wherever it might be placed. The aspirator was constructed to handle from one to four tests simultaneously, as required. Provision was made not only to aspirate the general atmosphere but also to permit the air-flow analysis of soil, clothing, and foods. The entire assembly is substantially unbreakable and light enough to be carried by one or two men.

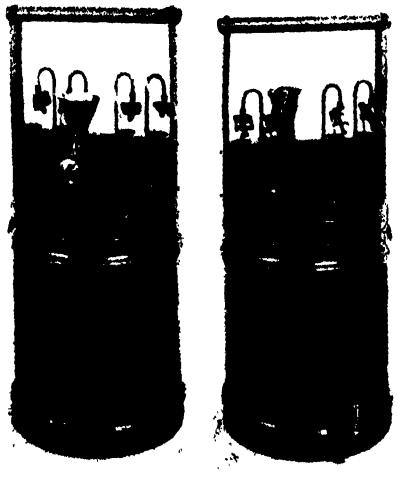

Figure 1. *Left,* Front view of the aspirator. *Right,* Rear view

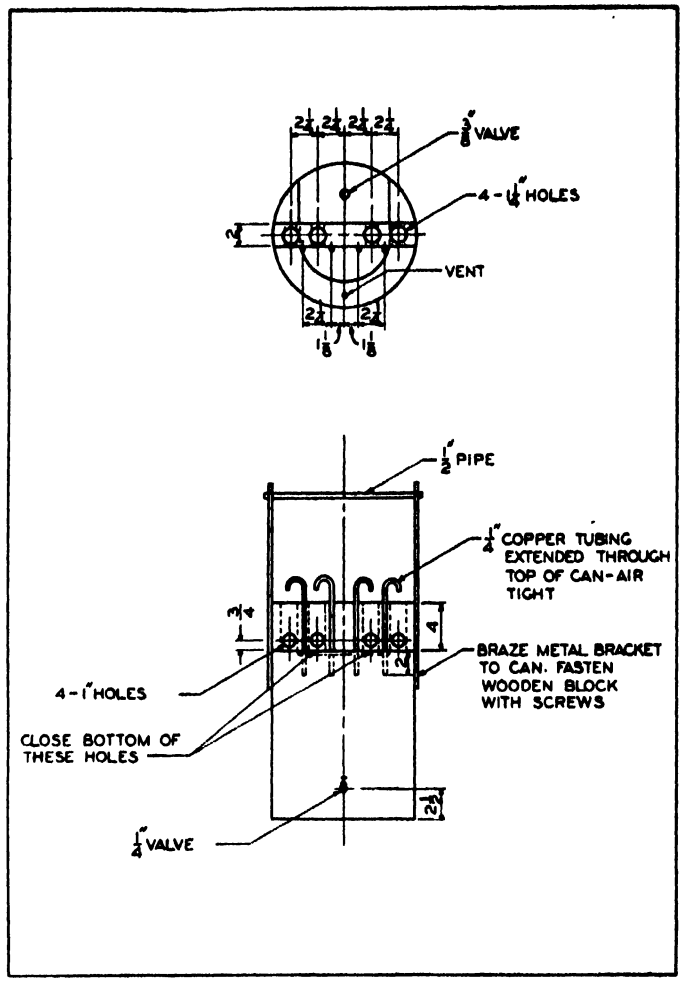

Figure 2

The apparatus is illustrated in Figures 1 and 2. It was easily and cheaply constructed from a 5-gallon solvent pail, an 11-inch length of 2 × 4 inch timber, a 12-inch length of 1-inch pipe, and a few other odds and ends.

Water inlet and air exhaust valves were attached to the top of the pail and a water outlet valve at the bottom as illustrated. The 2 × 4 inch timber was bored to accommodate four wide-mouthed 1-ounce bottles, and peepholes were provided so that the contents could be viewed. Saran flexible plastic tubing with very short rubber connections was used on the exterior to avoid the possibility of breakage. Connections to the air space of the pail were made with short lengths of $^1/_4$-inch copper tubing, as illustrated. Ten cc. of reagent are used in each bottle.

An accessory comprises a 3-foot length of $^3/_{16}$-inch Saran tubing attached to a small tin funnel containing a 100-mesh screen as a filter. This funnel can be placed directly on the ground or held against any object, and it can be heated with an alcohol blow torch to facilitate the volatilization of mustard or other high boiling contaminants (Figure 3). The funnel can also be supported in an upright position on an ordinary laboratory clamp attached to the metal strips of the handle, and in this position samples of soil or of foods can be subjected to air-flow analysis.

Tests have shown that the apparatus will operate for 15 to 60 minutes with one filling of water, pulling air through the test solutions as fast as the water is released from the pail. Consequently it can be left where desired or even lowered by a rope into cellars or other confined spaces, to minimize personal exposure to toxic atmospheres.

The apparatus was sprayed with a khaki paint having the following composition:

30 grams ferrite lemon yellow
21 grams medium chrome yellow
4 grams spirit-soluble nigrosine black
99 grams Asbestine No. 3x

Special License TEC-NY-687

A.

Figure 3. Machine in actual use by a man wearing gas mask

78 grams Celite No. 110
42 grams barite
278 grams Rezyl resin solution No. 869-1
60 grams Varsol No. 2 solvent
20 grams V. M. & P. naphtha
10 grams 6 per cent cobalt Nuodex drier

This paint was prepared by grinding all of the pigment with 130 grams of the Rezyl resin solution in a laboratory roller mill and then diluting the paste with the balance of the liquids. The paint was reduced 20 per cent with additional solvent for spray application and the coating allowed to dry at room temperature.

On contact with liquid mustard gas the color of this paint changes from khaki to black by reason of the strong solvent action of this fluid on the nigrosine dye contained in the pigment mixture. Prolonged contact with the liquid vesicant causes the paint to blister.

Somewhat larger proportions of the nigrosine black may be used in the above formula to yield olive drab shades of color and increased sensitivity. The replacement of the yellow pigments with white ones enables the production of battleship gray shades. Other paint oils and Rezyl resins may be used in place of Rezyl 869-1.

These paints may be used as vesicant liquid detectors when applied to any desired object.

Chemical Reagents and Equipment

For use with this apparatus or as otherwise desired, following extensive tests in which many suggested reagents were eliminated, these items were assembled in a 14 × 7 × 2 inch plywood rack made to fit within a small canvas bag. The assembly is shown in Figure 4.

Equipment

One Lenk No. 105 high-heat alcohol Blotorch[1]

[1] Blotorch is charged with 250 cc. of 95 per cent ethanol.

One No. 22905 Starkey micro gas generator[2]
One box filter paper (9 cm. No. 1 qualitative)
One 10-cc. graduated cylinder
Two glass stirring rods, 150 × 5 mm.
Two sections of glass tubing, 150 × 5 mm.
One 2-inch glass funnel
Six 10-cc. test tubes

Solvents

One 16-ounce bottle of distilled water
One 4-ounce bottle of 95 per cent ethanol
One 4-ounce bottle of *n*-heptane
One 1-ounce bottle of glacial acetic acid

Reagents and Their Uses

No. 1. One 4-ounce bottle of gold chloride solution prepared by dissolving 1 gram of gold chloride and 1 gram of concentrated hydrochloric acid in 1 liter of distilled water. This solution becomes turbid by precipitation of a gold complex upon reaction with mustard gas. Carbon monoxide on the other hand quickly reduces the gold chloride to deep-purple-colored colloidal gold sol readily distinguished from the mustard gas complex. Hydrogen sulfide produces a black sulfide dispersion, and sulfur dioxide gives a pink color.

No. 2. One 4-ounce bottle of sodium iodoplatinate solution, prepared by dissolving 0.265 gram of sodium iodide in a little water, then adding 0.05 gram of chloroplatinic acid ($H_2PtCl_6.6H_2O$) separately dissolved in 1 or 2 cc. of water and diluting the mixture to 180 cc. This highly colored solution can be further diluted with 5 to 10 times its own volume of distilled water for use in the aspirator.

Mustard, carbon monoxide, sulfur dioxide, and a few other reducing gases quickly discharge the color of this solution. Mustard gas, however, liberates free iodine which can then be detected by starch indicator. Chlorine and nitrous fumes also liberate iodine.

[2] Generator is charged with 12 grams of iron sulfide (20 cc. of 20 per cent sulfuric acid are added prior to use).

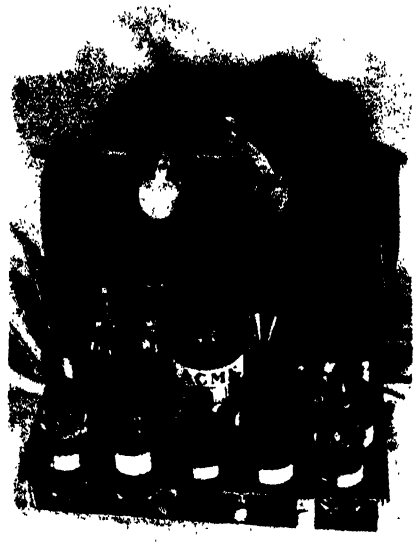

Figure 4. Reagent assembly and carrier

No. 3. One 4-ounce bottle of sodium hydroxide solution containing 20 grams of sodium hydroxide in 80 grams of distilled water. Lewisite is decomposed by this solution with evolution of acetylene, which is detected by freshly prepared cuprous chloride test paper placed in an adjoining, connecting tube.

No. 4. A 1-pound can of chlorinated lime. The violence with which a small pinch of the powder reacts with drops of the liquid mustard constitutes a useful qualitative test. The powder is also useful for first aid and decontamination purposes.

No. 5. A 1-ounce bottle of a new reagent comprising a mixture of 5 grams of selenium dioxide with 20 grams of powdered anhydrous calcium chloride. When the liquid vesicants are brought into contact with this powder and the powder is wetted with a few drops of water, the mixture becomes colored pink to red by reduced selenium. Thiodiglycol and the alkyl chloroarsines also respond to this test. The anhydrous calcium chloride serves to replace the 50 per cent sulfuric acid solution previously thought necessary, while its heat of solution provides the necessary reaction temperature without need of heating appliances. Care must be exercised to avoid the use of excessive amounts of water.

No. 6. A 1-ounce bottle of a solution containing 10 grams of silver nitrate and one gram of concentrated nitric acid in 90 cc. of distilled water. This is of value for the detection of halide ions from easily hydrolyzable gases such as phosgene, diphosgene, and the alkyl chloroarsines.

No. 7. A 1-ounce bottle of 10 per cent ammonium hydroxide solution. A mixture of 3 cc. of this with 6 cc. of reagent No. 6 will form a precipitate of reduced silver when added to silica gel on which has been adsorbed Lewisite, chloroacetophenone, or bromobenzyl cyanide.

No. 8. A 1-ounce bottle of solution containing 3 grams of copper sulfate, 3 grams of ammonium chloride, and 5 grams of hydroxylamine hydrochloride in 88 cc. of distilled water. Nine cc. of this and 1.5 cc. of reagent No. 7 are admixed for saturating the filter paper which is used with the Lewisite reagent No. 3.

No. 9. A 10-cc. vial of 10 per cent barium chloride solution which is of value for detecting sulfate ions formed when dimethyl sulfate, chlorosulfonic acid, or sulfur trioxide fumes are absorbed in water.

No. 10. A 1-ounce bottle of 20 per cent sulfuric acid, used in conjunction with the micro hydrogen sulfide generator for the preparation of the few cubic centimeters of hydrogen sulfide solution which may be used for the detection of the arsine war gases.

No. 11. A 1-ounce bottle of silica gel adsorbent.

No. 12. A 1-ounce bottle of activated charcoal adsorbent.

No. 13. A 10-cc. vial of soluble starch.

Test Papers

Vials of test papers were also included in the kit and, when not commercially available, were prepared by immersion of filter paper in the specified solutions. *The papers were selected to detect not merely certain of the war gases but also other gases which could influence the behavior of any of the reagents.*

1. For chlorine and other oxidizing gases (used moist)
   (*a*) Potassium iodide-starch paper. This paper gives the blue color of the starch-iodine complex in the presence of chlorine, bromine, and nitrous fumes.
   (*b*) Potassium bromide-fluorescein paper. Prepared from a solution of 0.2 gram of fluorescein, 30 grams of potassium bromide, 2 grams of potassium hydroxide, and 2 grams of sodium carbonate in 100 cc. of distilled water. The color change is from yellow to red for chlorine.
   (*c*) *o*-Tolidine paper. Prepared from a solution of 0.1 gram of *o*-tolidine in 100 cc. of 10 per cent sulfuric acid. The color change is from yellow to orange for the oxidizing gases.
2. For phosgene and diphosgene
   Harrison's reagent paper. Prepared from a solution of 1 gram of *p*-dimethylaminobenzaldehyde and 1 gram of diphenylamine in 10 cc. of carbon tetrachloride. The color change is from white or pale lemon yellow to deep orange in the presence of phosgene, diphosgene, chlorine, or hydrogen chloride. Used dry.
3. For chloropicrin
   Dimethylaniline paper. Prepared from a solution containing 10 grams of dimethylaniline in 90 grams of carbon tetrachloride. This changes from white to yellow or brown in the presence of chloropicrin, but the color quickly fades after removal to pure air. Used dry. Methylbenzylaniline may be substituted for dimethylaniline, giving a more permanent test paper because of its reduced volatility. Both reagents, however, give the best results when freshly prepared
4. For general purposes
   "Alkacid" paper. This universal pH indicator paper is very sensitive to ammonia and to all of the hydrolyzable acid gases. Color changes are illustrated on the label of the vial. Used moist.
5. For reducing gases and mustard gas
   Sodium iodoplatinate paper. Prepared from a solution containing 0.265 gram of sodium iodide and 0.05 gram of chloroplatinic acid in 30 cc. of distilled water. This violet-purple-colored paper is used moist and is decolorized by mustard gas, thiodiglycol, hydrogen sulfide, carbon monoxide, and sulfur dioxide.
6. For mustard gas
   Gold chloride paper. Prepared from a solution of 1 gram of gold chloride in 9 grams of water. This pale yellow paper turns reddish brown in contact with the liquid form or concentrated fumes of mustard gas. Used dry and then moistened to accentuate the color change.
7. For hydrogen sulfide
   Lead acetate paper. Ten grams of lead acetate are dissolved in 90 cc. of distilled water. This paper becomes dark or decidedly black in the presence of hydrogen sulfide.

Bomb Damage to Industrial Plants

C. H. S. TUPHOLME, St. Christopher's Firgrove Hill, Farnham, Surrey, England

Now that the veil has to some extent been lifted on bomb damage to industrial plants in Britain, it is possible to outline the chances of damage to various types of factory construction. Particulars of similar damage in other countries have also become available through various channels. Useful information on this subject has been collected and published in various forms—notably in the Wartime Building Bulletins, 1940, Nos. 1, 4, and 5, issued by H. M. Stationery Office; a "Report on Buildings Damaged by Air Raids and Notes Relative to Reconstruction", issued last year by the Institution of Structural Engineers in London; and a paper on "Proneness to Damage of Plant through Enemy Action", read by Hal Gutteridge before the Institution of Mechanical Engineers early this year.

Mr. Gutteridge considers the kind of damage that results from the dropping of high-explosive and incendiary bombs from aircraft. His paper excludes consideration of damage arising from other kinds of enemy activity.

The extent and severity of damage to the plant depends upon the protection given to it by the building, and the first observations to be made when carrying out a rapid approximate estimation of the damage will concern the building or buildings. The site of the building and its position in relation to any other near-by buildings also affected gives the first general impression of the extent and severity of the damage which may be expected and provides an indication of the work involved in reinstating the damaged plant.

The type of building construction least likely to suffer from the effects of a bomb explosion is that which is sufficiently resilient to recover its former position without strain or disintegration. Momentarily, after the explosion, the structure may have to adjust itself rapidly to very unequal air pressures on different parts which may set up strong forces in its various members. Such stresses require proper continuity of reinforcement, or soundly jointed structures, with beams and columns acting as one unit, a feature which is found only in steel frame buildings or in those of reinforced concrete construction. In all steel frame and other types of construction the design should be such as to localize the effect of the bomb and minimize progressive structural failure.

Walls of a modern factory are not part of the structure. If they are external walls their purpose is mainly to keep out the weather, to allow light and air in the interior, and to preserve air conditions within the factory. If internal, they form the necessary divisions of the area. They may act as protective walls or be used for other nonstructural purposes. If, therefore, in a modern steel-framed building all the walls have been blown out, the danger of collapse need not be anticipated. Protective walls are arranged to divide the factory into a number of "cells" so that the effect of a bomb explosion will be localized. The number of cells depends upon the nature and arrangement of the plant and the operations carried on. It is usually possible in existing works, both engineering and industrial, to arrange the walls so that a high degree of protection is achieved without interference to the work of the factory. In future factory layouts this aspect of protection will be incorporated in the design as a matter of good practice.

Roofs and floors of solid concrete strengthened with filler joists or steel reinforcement give more protection against bombing than floors in which lightness has been obtained by the use of hollow tiles or other means. With floors of the latter type the damage to the plant can be expected to be greater. In single-story buildings of light steel frame or reinforced concrete construction the roofs are not usually designed to be proof against incendiary bombs, and the damage will be of a different character for the bomb will fall directly upon the plant. In this type of factory the division of the floor into cells by protective walls designed to localize the effects of bombs or fire is particularly applicable.

If drainage is not adequate to deal with the abnormal conditions during a fire when large quantities of water may have to be conducted away, the consequent flooding is likely to damage plants which have been submerged. Particularly susceptible in this respect are electric motors and electrical equipment generally.

The five main causes of damage to factory plants consequent upon an enemy attack from the air are:

1. Direct hit from a high-explosive bomb.
2. Blast pressure wave from bomb explosion usually accompanied by flying splinters and debris.
3. Fire caused directly by incendiary bombs or indirectly by high-explosive bombs.
4. Damage from debris falling from above.
5. Flooding or drenching by water.

Each of the causes has a different effect on different types of plant. All plants can be classified in this respect and limits set within which the damage is likely to fall. For example, a blacksmith's anvil is unlikely to suffer any damage from any of the causes mentioned above except in an

extreme set of conditions in which it might be exposed to a direct hit or to intense heat. Such an item would have a minimum proneness to damage. At the other extreme would be some recording control equipment, such as a thermostat, thermograph, or gas composition recorder, which would be severely damaged by any of the above causes if they were near. The proneness to damage of such equipment would be high.

It is convenient to denote this variable proneness to damage by a number which will indicate the percentage of the value of the item (in its condition just before the incident) which has been lost by the damage it has suffered. This might be called the damage proneness number, or d. p. n. The anvil could be given a set of limits, to represent the damage likely to occur in average cases, of between 0 and 5, while the d. p. n. of the control equipment could be expected to fall between 70 and 100. These limits must of necessity refer to average cases, and whether the figure should be towards the higher or the lower limit or whether, in an exceptional case, the figure should be outside the limits must depend on the judgment of the experienced engineer at the inspection.

In seeking to establish these limits the physical characteristics of the item will affect the result in every case, except where extreme conditions have occurred. By this method the limits of probable damage can be narrowed and placed on a firmer basis, as an aid to the trained observer in the rapid approximate estimation of the plant value lost.

Generally factory plants can be classified in terms of damage proneness somewhat as follows: heavy all-metal equipment for the heavy engineering industries, in the form of rolling mills, large presses, steam hammers, etc., will have a low damage proneness number, while in light high-speed machines used in cotton weaving and spinning, packaging machines for tea, margarine, etc., the d. p. n. will have a comparatively high value. The lighter equipment employed in engineering factories, such as lathes, shaping machines, grinding machines, etc., are in average cases likely to suffer damage to parts other than the beds or bases when exposed to blast or fire, and the damage proneness number may be expected to lie between 20 and 50. It may be somewhat higher if the electric motor drive has been exposed to heat or flooding. If efficient dwarf protective walls were provided, the damage proneness number would lie towards the lower limit.

Intricate machines of lighter construction will need a much greater proportion of the replacement value to be expended in repair, in relation to the proportion of actual damage, because of the high cost of assembly. On the other hand, the cost of removal and reinstallation will be considerably less than for plant of a heavier type. Heavy machines of an intricate nature, such as looms, will have high damage proneness numbers, despite their great weight, due to the large number of delicate parts and to the high precision required. The high-speed automatic type of machine constructed of fabricated steel has a greater chance of survival than a machine made of cast iron, for the combination of toughness and malleability of the former is, in these conditions, a superior characteristic to the brittleness of the cast iron. Sheet metal equipment in any form, such as milk pasteurizers, fan casings, and ducts, suffer severely, for they offer a large area ill-supported to resist a suddenly applied pressure followed by an equally sudden subatmospheric pressure. Failure takes place by tearing at rivet holes, followed by general crumpling of the plate. Where exposure to blast, falling debris, or fire has occurred, a damage proneness number between 60 and 90 may be expected.

The proneness to damage is also affected by the extent of the surface of the item exposed to the blast. The blast is resisted by the weight of the item and by any anchorage that it may have to a secure foundation. It is convenient to classify such plants, excluding items held down to their foundations, in terms of the ratio of the weight in pounds to the exposed area in square feet. Application of this criterion assumes a structurally sound item and a rigid surface. Thus, a Lancashire boiler when full of water would have a high ratio of weight to exposed area.

The general practice of attaching service piping to the most convenient point of support has persisted despite the many advantages in accessibility, clean layout, absence of obstruction, and protection from fire or other damage which is realized by placing such piping below the ground floor level in covered channels, with vertical branches only to the points to be supplied. An added reason for such treatment is provided by the threat of air raids, for piping not so arranged is particularly vulnerable to blast, fire, or falling debris. It cannot be too strongly impressed that the supply services carried by such piping are the arteries supplying life blood to the machines, without which they cannot operate. Factory piping should therefore receive the attention which its importance warrants, and improvements should be sought in the following directions:

1. The total length of the service lines should be as short as possible.
2. The piping should be duplicated within reasonable limits, the second line being far enough away from the first to avoid the possibility of one bomb destroying both.
3. Adequate protection should be given by placing the piping underground or disposing it in other ways.

If piping is attached to the structural members and total collapse of the building takes place, the piping will become a total loss with a damage proneness number approaching 100, for none of it except the valves is worth recovering. If, however, the piping has been placed underground, then even with a total collapse of the building, only the vertical "runs"—and these are the less important—will be lost. The damage proneness number may be expected to lie between 40 and 80.

Cables for the supply of electricity, as well as electric motors, switchgear, etc., are particularly vulnerable to blast, fire, falling debris, and flooding especially. As with piping for the various services, the cables should be run in channels, watertight in this case, with vertical leads to the points of consumption. All main supply cables should be duplicated. They should be laid underground, far enough apart to prevent the possibility of one bomb affecting both of them.

Electric motors are particularly susceptible to damage from these causes, but their strong body casing protects them from falling debris. They also offer a high resistance to blast by virtue of their high ratio of weight to exposed area and because of their secure fastening to their bases. Even so, it is a frequent experience to find the feet fractured and the motor dislodged. The coils and windings, although comparatively well protected, are easily damaged by flying debris and flooding. If flooding alone has caused the damage, they can sometimes be reconditioned by drying. A general damage proneness number for all electrical motor equipment, including attendant switchgear but excluding distribution mains, may range from 50 to 80 in average cases. In generating stations protection for the turbine generator set can be provided by building a separate reinforced concrete structure.

From the viewpoint of this survey boilers can be classified into two general classes: Cornish, Lancashire, and fire-tube boilers of that category; and vertical and water-tube boilers. Boilers of the first type are heavy objects when filled with water; they are set low, near the ground, and are well bedded, with sides mostly shrouded with brickwork. They offer a high ratio of weight to exposed area and suffer little damage in themselves, although the steam connections above are likely to receive injury from flying debris. The damage proneness number for the first type of boiler is likely to be between 10 and 30 if the boiler settings have not been disturbed. The second class of boiler is more susceptible to damage than the first, for such boilers are built as comparatively high structures, securely held to their foundations with a high center of gravity. The damage proneness number of this class may be between 40 and 70.

For the rapid approximate estimate of the loss in value of the damaged plant the following order of observations is suggested:

1. A general inspection of all buildings on the site and of the adjacent buildings, to obtain a comprehensive impres-

sion of the extent of the damage likely to have taken place.

2. Inquiries as to the type of bomb which caused the damage, whether the factory received a direct hit and, if fire followed, where and for what period the fire continued.

3. If a fire occurred, whether it burned itself out or was quenched by water.

4. A detailed inspection of the type of building construction, its condition, and whether any collapse took place.

5. A detailed examination, as far as possible, of the whole of the plant, its layout, nature, and the condition of all the items damaged.

6. Ascertainment of the value of all the damaged items, the value to be that immediately before the incident.

7. Preparation of a schedule showing all items or groups of items of damaged plant; the damage proneness number of each in the light of the conditions to which the item was exposed; and the corresponding loss in value. By summing the individual losses the total loss is obtained, which can be expressed as a percentage of the total former value.

An example of a schedule of a possible case is given by Gutteridge. A factory of three floors covering a half acre in one building of load-bearing brick construction with internal joists and columns not soundly joined together received a direct hit from a high-explosive bomb of large caliber. The result, it is supposed, was the total collapse of the factory, with fire breaking out in one part of the building among flammable materials in process of manufacture. The fire, however, did not spread. In such a case the schedule given in Table I might reflect the state of affairs in an approximate estimation of the loss in value of the plant.

Table I. Approximate Estimate for Damage

Item	Value, £	D. P. N.	Loss, £
Processing plant	20,000	50	10,000
Packaging equipment	4,000	75	3,000
Conveyors	1,000	100	1,000
Refrigeration plant	6,000	50	3,000
Electrical equipment	3,000	80	2,400
Service piping	3,000	100	3,000
Boilers	4,000	30	1,200
Motor vehicles	2,000	50	1,000
Miscellaneous	3,000	50	1,500
Total	46,000		26,100

Each of the items in the table will be made up of a number of units of various types and values, each of which would have been given a damage proneness number, so that the actual items shown represent totals for groups of individual items. The total loss for the whole of the factory plant works out at a little over 56.7 per cent of its actual value.

Whether the damage to the plant was extensive or trivial, the same procedure is necessary for reinstatement of the plant. The approximate estimate of the loss in value will have provided the necessary information upon which to base the decision as to the future program in regard to the re-establishment of the plant.

In the case of a totally collapsed building, if it is decided to rebuild upon the same site, the work involved falls into two parts. The first part consists of clearance from the site of debris and the plant and the dispatch of the damaged plant for repair. It is well to note here that much further damage may be done to the plant in taking it down, disentangling it from the debris, and loading it on to the removal vehicles, so this work should be carried out only by competent men. It is usually preferable to return the damaged plant to the makers rather than to other firms.

The second part of the program is repair of the equipment, planning of its subsequent layout, construction of the building to suit the new layout, and reinstatement of the plant leading to the re-establishment of the factory.

A plant sent for repair necessitated by enemy action should be overhauled for normal wear and tear at the same time. The total cost of repairs should be allocated, therefore, to two accounts. The first account would show the cost of repair of damage due to enemy action, including the cost of removal, carriage outwards, dismantling at the repair shops, reassembly, testing and storage until the new building is ready, return carriage, re-erection and testing as a unit. The second account would show the cost of overhaul for normal wear and tear. From these accounts the actual value of the loss on repairable items will be ascertained.

Sets of Abstracts

Sets of abstracts of the Buffalo meeting papers in planographed book form will be supplied by the A. C. S. News Service, 1155 16th St., N. W., Washington, D. C. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors. The abstracts will be mailed as soon as possible after receipt of order, beginning about September 2, and will also be on sale at Buffalo, N. Y.

This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.

To those without receipt for divisional dues, who remit with order, $1.00.

To those who fail to enclose remittance with order, necessitating correspondence, $1.25.

To those who require bills to be rendered, $1.50.

New Dates and Location for National Chemical Exposition

The Chicago Section of the American Chemical Society announces a change of dates for the National Chemical Exposition, which has been moved to November 24 to 29 in place of a week earlier, as originally planned. This has been made necessary because the Stevens Hotel in Chicago, where the exposition was to have been held, has been taken over by the United States Army. The exposition consequently has been transferred to the Sherman Hotel, where the conferences also will be held. The Sherman is conveniently located at Clark and Randolph Streets in Chicago's business center.

No changes are planned in the original program for the exposition and the daily conferences to be addressed by leaders in the chemical industry, educators, and other outstanding authorities will be held. There will also be an interesting display of motion pictures. More than one hundred exhibtors can be accommodated in the available space, which is not so large as that originally at the committee's disposal. Consequently if there are those who have deferred their decision as to making exhibits, they should complete their plans without delay, as it is likely that available space will soon be exhausted.

Duke Station Research Directed toward Agar Supply

The Duke University Marine Station on Piver's Island, Beaufort, N. C., has opened its doors to biologists for the fifth consecutive summer. Classes and research work are in full swing under the leadership of A. S. Pearse, director, assisted by C. G. Bookhout and H. J. Oosting.

Included in the new equipment being used is a boat and residence provided for the newly appointed resident investigator, H. J. Humm, who took up duties on June 1. Mr. Humm, who will be located at the station for three years, is studying the possibilities of making agar and alginic acid from the marine seaweeds of the region and hopes to aid in averting a war-produced shortage of agar. H. L. Blomquist, chairman of the Duke University Botany Department, has recently returned from a 10-month visit as an exchange professor at the University of Puerto Rico, where he investigated tropical seaweeds as sources of agar. Professor Blomquist reports that he has located several types of seaweed from which satisfactory agar-producing materials might be obtained.

At the end of June, **Martin Williams** began work as a research chemist with the Tennessee Copper Co., Copperhill, Tenn. He was previously instructor in chemistry at the University of Alabama.

The Story the Rocks Tell of Niagara Falls

Its Past, Present, and Future

GLENN C. FORRESTER, 334 Buffalo Ave., Niagara Falls, N. Y.

Introduction

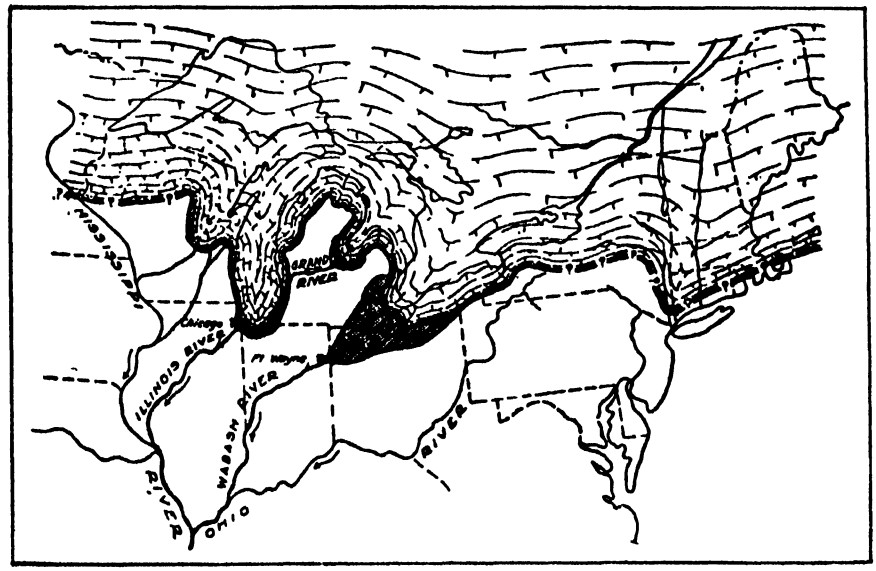
Surplus water from rain or melting snows, which falls on a large section of our continent, collects temporarily in the Great Lakes. These reservoirs spill over from one to another oceanward. The spillway from Lake Erie to Lake Ontario is known as the Niagara River.

This river leaves Lake Erie at Buffalo as a wide unhurried stream. It flows in a shallow channel across a flat plain having an elevation of about 600 feet above sea level. Twenty-seven miles to the north the water enters Lake Ontario as a broad quiet river slightly entrenched in a low plain bordering the lake. This plain, however, is less than 300 feet above sea level and more than 300 feet below the first. The placidity of both the source and mouth of the river betrays no sign that midway in its course the waters are lashed to unequaled fury in making the descent in a series of rapids and falls. The one great vertical drop is called "Niagara Falls".

In traveling from the upper to the lower of the two plains, descent must be made over the face of a high precipice or escarpment. However, Niagara River makes the greater part of its descent, not at the escarpment, but at the head of a gorge extending back from that declivity seven miles into the upper plain.

Something of the origin of this gorge and the story of Niagara as revealed in this seven-mile-long manuscript, we hope will be of interest to the chemist attending the 104th national meeting of the American Chemical Society.

The story opens during the Great Ice Age when northeastern America lay buried under an ice sheet two miles thick in the Laurentian Highlands. Its sheer plasticlike mass caused it to push out to the south as far as the Ohio River. Prior to its accumulation the drainage of this region was chiefly to the southwest into the present Mississippi basin, but the glacial flow strongly remodeled the topography over which it moved. It scraped away surface soil, which ages of weathering had formed from resident strata, and even gouged deeply into the bed rock itself. Here it deepened and enlarged preglacial river valleys. Farther along it relinquished its load of debris, damming the valleys and forming the basins now occupied by the Great Lakes. The area to the northeast, underneath the center of the glacier, was depressed, partly by reason of the great weight of the overlying mass of ice. These two processes of filling and depression reversed the drainage of the region from southwest to northeast, and formed a low divide separating this northeasterly basin from the Mississippi Valley.



At its greatest extent the ice sheet had pushed out far beyond the boundaries of the St. Lawrence Valley. When winter relented and the onslaught of a milder climate began to beat back the ice front, the first floods of water from the melting glacier flowed off directly to join the Mississippi. However, when the margin of the ice had receded to a position behind or north of the newly formed divide but still obstructing drainage to the northeast, the waters from the melting ice were impounded before the ice front and formed lakes which stood at the levels of low points in the divide through which the overflow escaped to the south and west as before. These lakes were numerous and of varying duration. When one was held at a constant level for a sufficiently long period, well-defined beaches were formed by wave action, many of which are still distinct and well preserved today.

Since Niagara Falls is merely a vertical drop which the overflow from the upper lakes makes in its descent to the ocean, the origin lies far back when these lakes were taking form; and its modern story must properly commence when that discharge first fell over the escarpment at Lewiston.

We can picture the first stage as characterized by long, narrow, crescent-shaped iceberg-studded lakes bordering the ends of the major lobes of the retreating glacier, transient precursors of the corresponding greater lakes of today.

A predecessor of the present cataract had a substantial existence at this time when the melting ice front at the eastern end of Erie uncovered an outlet to the Hudson Valley some 80 feet lower than the Grand River across Michigan which had served up to this time. A fall as high and as great in every way as the present Horseshoe occurred in this course in central New York. For a protracted period the fall was located on what is now Clark Reservation about four miles southeast of Syracuse. It cut a gorge 1,600 feet long, and at its base scoured out a deep pool corresponding to the deep plunge basis at the foot of our Horseshoe Fall. In it now lies the deep Jamesville Lake. The silent brink, the strongly water-scoured channel above, the majestic amphitheater enclosed by the high gorge walls, are exactly what one would see today if the flow of Niagara were stopped. They stand as mute but impressive witnesses to an earlier chapter of Niagara, and well deserve the few minutes' pause required for a visit if journeying on Route 20.

Ultimately, retreat of the ice from central New York opened a still lower outlet for the combined Lake Erie–Ontario into the Mohawk Valley at Rome, N. Y. It was at a level considerably lower than that of the plain on which Buffalo and Niagara Falls now stand so the lake level

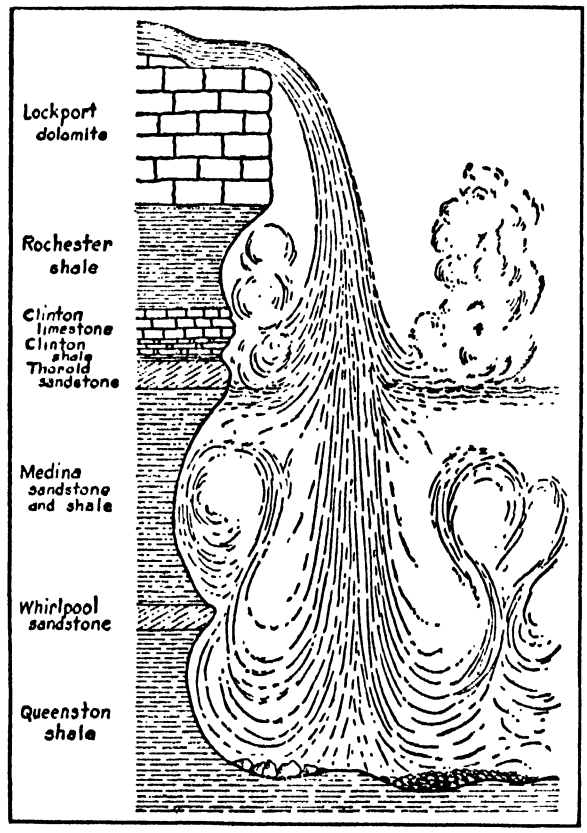

Figure 1. First glacial Great Lakes. The water areas are shaded.

fell, and the subsiding body of water was divided into two lakes corresponding to Erie and Ontario of today. With Erie spilling over the escarpment at Lewiston, Niagara Falls came into being and its modern chapter began.

But this leaves us with a Niagara seven miles from its present site.

The rock strata of this region are nearly horizontal, but do have a slight dip southward of from 20 to 40 feet to the mile. The topmost stratum is the durable Lockport dolomite 80 feet in thickness at the falls. Underneath this layer are several hundred feet of relatively soft shales and sandstones only occasionally interrupted by thin resistant members. The thousands of tons of water which glide over the crest of the falls strike with tremendous force at the base of the cliff far below. Even the most durable strata would be too feeble to withstand such battering action. Armed with blocks of rock which have fallen from above, the swirling currents in the deep plunge basin at the base of the Horseshoe batter the sides, wearing away the softer layers, and undermining the capping dolomite until more great blocks fall from the overhanging ledge for want of support. Thus the brink of the cataract is always an overhanging shelf, projecting beyond the face of the supporting rock wall. Whenever a block falls from the brink it contributes to lengthening the gorge at the top and at the same time supplies a new tool for lengthening it at the bottom. Each fall of rock from the crest attacks with renewed vigor the supporting wall behind the falls. It is now recognized that the whole gorge from Lewiston to the Horseshoe Fall, with the exception of the Whirlpool which has an interesting story of its own, has been excavated by this process of backward, rather than downward, erosion.

From the mechanics of the retreat it is apparent that the fortunes of Niagara must have varied not merely because of one but several factors. Change in height of a cataract like Niagara would alter the vigor of the attack at the base, and also vary the amount of rock material to be removed. The character, thickness, and arrangement of the strata could be important influences for rapid or slow retreat. Distribution of the water over a wide crest would make for ineffective erosion, as is the case in the American Fall today. The system of cracks and fissures in the capping layer determines in advance the size and shape of the blocks which are to fall when undermined. However, of all the qualifying factors, it appears that in the life of the cataract the volume of the river has fluctuated most remarkably and has been of greatest significance.

Figure 2. Sectional view of Horseshoe Fall showing arrangement of strata, depth of water, and mechanics of recession.

Since the volume of the Niagara River is the discharge from the upper Great Lakes by way of Lake Erie, pulsations of Niagara are merely the echoes of events of greater magnitude in the theater of the Great Lakes. A knowledge of Great Lakes history is therefore desirable since it accounts for vicissitudes which the falls appear to have experienced and corroborates in a most remarkable way the interpretation of the history of the gorge, which its character suggests.

Inspection of the northern and eastern borders of the Great Lakes discloses that there are several elevated beaches, which, when followed to the south and west, dip below the levels of the lakes and disappear. These facts and other observations made within the past 60 years reveal that almost the entire Great Lakes region has been tilted toward the south and west. At the southwestern ends of Lakes Superior and Erie the level of the water appears to be rising as much as two feet per century; on the northern and eastern shores it is receding correspondingly. This canting movement was in operation at the time of the last retreat of the glacier and, in fact, was in part caused by it.

These readjustments of the earth's crust, like the accumulation of the stresses which caused them, were not gradual and steady but abrupt and spasmodic. Rapidly melting ice and the partial draining of large lakes incident to the opening of some lower outlet were phenomena of relatively rapid development which greatly disturbed the nicely balanced isostatic forces in the earth's crust and set up, in consequence, stresses to be relieved only by crustal movement. The occasional earth tremors still felt in northeastern United States are probably an aftermath

Figure 4. Aerial view of Whirlpool looking northwest along course of the buried St. Davids Gorge. Outlet of the pool is at the right.

of earlier and much more violent activity, a further easement of the still uncompensated stresses in the architecture of this segment of the earth's crust.

So when the glacier retreated it was still of such magnitude as to weigh down the Laurentian region to such a degree that the overflow from the three upper great lakes found a channel, that of the Mattawa-Ottawa Rivers, lower than their outlet at Port Huron. The latter they promptly deserted and only the overflow from Lake Erie, a volume of water equivalent to about 15 per cent of present Niagara, now passed over the falls.

The consequently enfeebled Niagara of this period leaves its record in the shape of an extremely narrow gorge having a mean width of but 360 feet, and a shallow channel 35 feet in depth. This section is known as the Whirlpool Rapids and extends from the Whirlpool to the railroad bridges, a distance of about three fourths of a mile. It is encumbered with fallen blocks of dolomite which the cataract, like the American Fall today, was unable to move and destroy by grinding.

The head of the rapids opens upon the broad and relatively placid expanse of the upper gorge which is in sharp contrast to the chasm just described. One might suspect that Niagara history was again punctuated by some far-reaching event in upper lake history. This was notably true. Continued withdrawal of the glacier and the consequent continued elevation of the northeastern part of the continent eventually lifted the Ottawa outlet above the level of that at Port Huron and again forced the overflow to seek passage via Lake Erie and over Niagara in its journey to the ocean. This movement has continued. The Ottawa outlet today is 117 feet above the level of Lake Huron.

The Niagara which we know was thus restored to its present greatness and regained the power to excavate a wide and deep gorge. The time which has elapsed since that restoration has been sufficient for the falls to retreat 12,000 feet and, calculated from their recently measured average rate, would amount to more than 3,000 years.

Niagara Glen. This is one of the most delightful places along the gorge. Here stands unequivocal evidence of the existence at one time of a Niagara more than four miles from its present position.

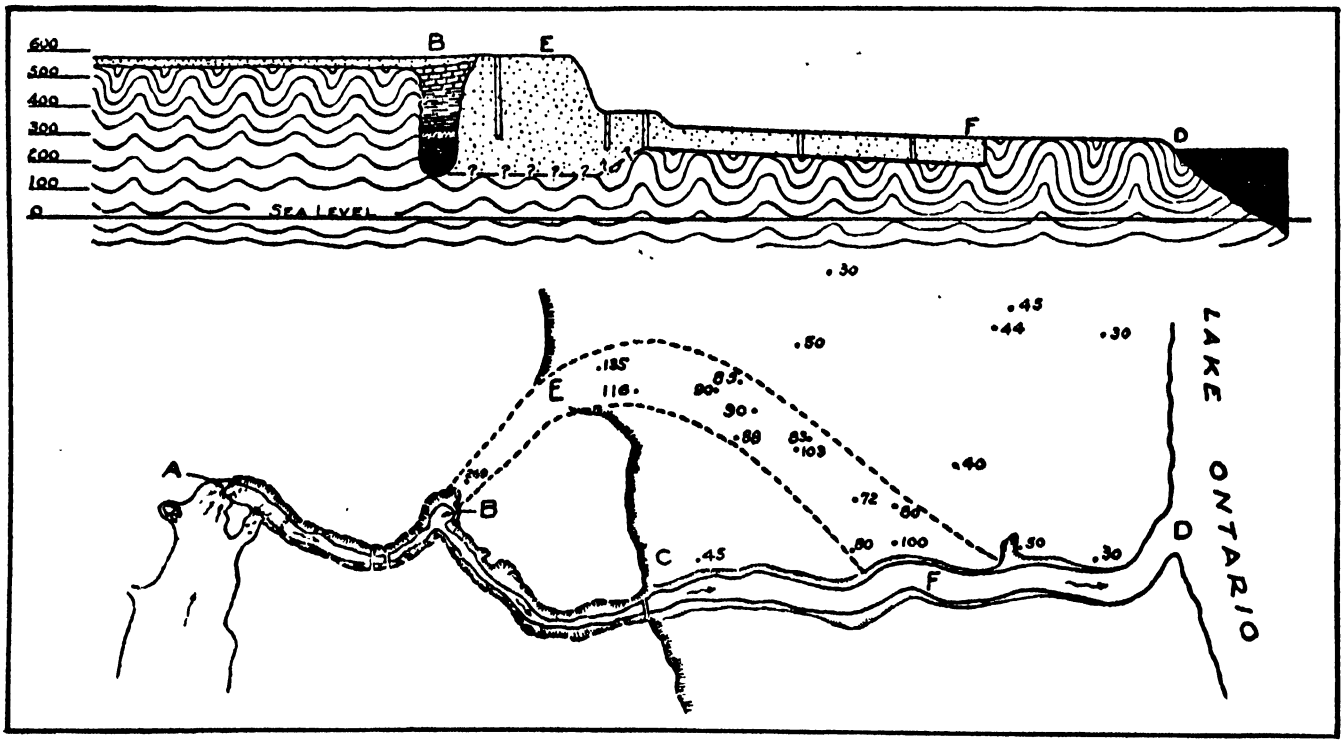
A thousand yards below the Whirlpool on the Canadian side of the gorge is a unique projection in the shape of a roughly triangular platform formerly known as Wintergreen Flat. Its surface is a little below the level of the adjacent upland from which it is separated by a short steep slope, an early river bank. A second side of the shelf is a ledge looking eastward over the glen to the American side of the gorge. The third side faces north and is also a cornicelike ledge capping a precipitous wall. At the base of this cliff is a confusion of huge dolomite boulders like those found at the foot of the American Fall today.

A north sloping dry channel known as Foster Flat, well wooded and littered with more such blocks of Lockport dolomite, leads away from the base of the cliff for one third of a mile to the water's edge. The flat is bordered on the west by the gorge wall. On the east is a low ridge strewn with blocks of dolomite, the remnant of an island which stood in the course of the river. The falls of today, divided by Goat Island, are recapitulating an episode in their history to which Niagara Glen is the interesting witness. When the cataract in its recession from the escarpment at Lewiston had reached point *B*, Figure 3, it was a broad waterfall; above it, occupying the position *C-D* was a narrow island dividing the river as Goat Island now divides it. Upon reaching the island the cataract was separated into two parts corresponding to the present Horseshoe and American Falls. However, in that instance the greater body of water passed on the American side of the island so the American Fall retreated upstream more rapidly. When the Canadian Fall had cut back to the head of the island the American Fall had passed it, allowing part of the sheet of water on Wintergreen Flat to drain eastward into the gorge opened by the latter cataract. The Canadian Fall, through this loss of water, became less active and soon fell out of the race leaving the abandoned brink at *A* to record its defeat. It is evident that the Canadian cataract did not hollow out a deep pool like that below the Horseshoe Fall of today, but was rather comparable in its mode of action to the present American Fall. The slope riverward from Wintergreen

Flat corresponds closely with what would probably be found under the American Fall if the river were stopped and the pool drained. The island was not broad enough to remain standing between the abandoned channel and main gorge. After the cataracts had passed, its pedestal of shale was disintegrated by weathering and the capping dolomite collapsed. It is peculiarly impressive to stand on the silent brink of the old waterfall at *A*, Figure 3, and look down the dry channel. It is no less impressive to descend and wander among the hugh blocks of rock at its base. Here may be found the shells of a species of fresh water mollusk which are alive only on rocks lying in the constant spray of the falls.

The Whirlpool. To the interrogatively minded person this interruption, the Whirlpool, midway in the course of the gorge appears unique. It occupies a roughly circular basin about 1,700 feet in diameter located at a sharp bend in the course of the gorge, a great swollen elbow. There the progress of the stream is most unusual and suggests that some pre-existing influence had had a hand in fashioning it. The turbulent waters rush in from the rapids and are impelled directly past the narrow outlet at the right. Circling to the left along the walls of the basin the current completes the circuit of the pool. It then finds itself separated from the outlet by the inrushing stream. Under this it is forced to dive, boiling to the surface near the outlet through which it slides.

Examination of the rock wall enclosing this basin reveals three breaks in its continuity: the inlet at the southeast, the outlet at the east, and a less well-defined breach on the northwestern side. The rock walls at either side of this break disappear under great banks of earth. As far as the eye can see they do not bound that side of the basin with a continuous rock wall. In fact, a comparatively small creek has cut a ravine to the water's edge, while a creek of equal size on the west side of the pool has been able to cut its channel only to the top of the rock wall over which it plunges more than 250 feet to the surface of the pool below. It would appear that there is a comparatively soft filling. Exploration of the ravine proves that this is true and that the rock walls on either side appear to continue in a north-northwesterly direction. Following this bearing across the upper plain, the Hydraulic Canal is crossed at a point where the concrete flume conducting the water does not lie in a channel blasted out of bed rock, as is the case with all the remainder of the canal, but instead rests on a bed of unconsolidated earth. In this neighborhood a boring was made to the depth of 269 feet without encountering bed rock. A few hundred yards to the east or west, bed rock is but a few feet below the surface. Continuing across country north-northwest for about two miles one reaches the gravel pits at the top of the hill south of St. Davids. There the escarpment, locally known as the Mountain, so precipitous both to the east and to the west, is absent and a much gullied hillside of glacial drift exists in its stead.



Such facts led geologists to suspect the existence of a buried channel extending from the Whirlpool to the break in the escarpment at St. Davids—a gorge made in some remote time, perhaps related in some way to the present one from the Whirlpool to Lewiston.

From the records of a large number of wells widely distributed between the escarpment and Lake Ontario it appears that the red Queenston shale underlies this plain at an average depth of 45 feet below the surface. There is, however, a strip running northeast from St. Davids in which the well records show boulder clay, quicksand, and gravel to much greater depths before the shale is reached. The width and depth of this channel in the rock are comparable with the width and depth of the present lower Niagara River. The strip intersects the lower Niagara about two miles south of Niagara-on-the-Lake. There the red shale which outcrops nearly everywhere along the river is absent and the river bank consists entirely of glacial drift. This in all probability is the cross section of a buried river channel and the strip characterized by the deep drift, no doubt, defines the course of the river which issued from the mouth of the Whirlpool—St. Davids Gorge.

From examination of such physical evidence the geological story of a region is pieced together. From a study of the dimensions and depth of these buried channels the following story of the Whirlpool has been deduced. It carries us back even beyond our first tentative beginning.

Conclusion

In a period preceding the last advance of the glaciers from the north a predecessor of Lake Erie sent its overflow across the

Figure 5. Map of the Niagara Gorge and lower river and of the buried St. Davids Gorge and buried lower river. The location and depth to the bed rock of a few of the wells which served to locate the buried channels are indicated. The vertical section is along the buried gorge and the river, which are now filled with glacial drift everywhere except at the Whirlpool.

upper plain to plunge over the escarpment at St. Davids, from whence it flowed northeast to the Ontario basin. During this period the cataract cut back from the escarpment to where the inlet of the Whirlpool now is. The gorge was excavated to a great depth by the plunging falls. From it issued the lower river flowing northeast across the lower plain rasping a channel in the Queenston shale. Later the glacier came on its last advance which carried it as far south as the Ohio River. When the ice melted away it left a mantle of glacial debris covering the region, burying the lower river channel and filling the gorge so that the old water course not only no longer offered a natural avenue for the overflow from the new Lake Erie to reach the Ontario basin, but did not even betray its existence. It was purely an accident of topography that the modern river crossed the upper end of that buried gorge and cascade down the escarpment at Lewiston. Not until the retreat of modern Niagara had reached and broken away the east wall of the theretofore filled Whirlpool basin, and had cleared out much of the drift filling, was the presence of the former gorge revealed. The bend in the course of the river directed the full force of the current against the wall formed by the filling of the old gorge. A great excavation was made down this ancient channel. The finer material was swept downstream, the heavier boulders sank to the bottom and now form the cobble pavement and lining of the pool so well exposed on its northern side. This bed of boulders now tends to retard further rapid enlargement of the basin by the swirling waters although at times scars of landslides from the fill into the pool may be observed.

Grateful Acknowledgment

THE EDITOR takes this occasion publicly to thank the Society of Chemical Industry for the honor which it has conferred upon him by designating him to receive the Chemical Industry Medal for the year 1942. The medal will be accepted at a joint meeting of the American Section of the Society of Chemical Industry and the New York Section of the AMERICAN CHEMICAL SOCIETY in New York, N. Y., on November 6.

Chester A. Snell has been appointed to the research staff of the Aluminum Research Laboratories at the Aluminum Ore Co. plant, East St. Louis, Ill. Prior to this Dr. Snell was a member of the teaching staff of the chemistry department, Polytechnic Institute of Brooklyn.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training. Future developments will be brought to the attention of our readers.

Medal for Achievement in Plastics

The John Wesley Hyatt Award Medal, to be awarded to the individual who makes the most significant achievement in the plastics industry each year, has been completed by Paul Manship, noted artist and sculptor. The medal, to be donated by the Hercules Powder Co., Wilmington, Del., will be cast in gold and awarded annually with $1,000 in cash. *Left.* The obverse of the medal bears a profile relief of John Wesley Hyatt, founder of plastics with his application of nitrocellulose to this use. *Right.* The reverse bears a Grecian urn symbolizing the intellectual achievement of the award winner, wheels symbolizing the mechanical ability necessary to form the plastic in its ultimate shape, a chemical retort to indicate the chemical origin of plastics, and dividers and triangle symbolizing plastics design. The award will be administered by a committee consisting of Richard F. Bach, dean of education, Metropolitan Museum of Art, Lyman J. Briggs, chief, National Bureau of Standards, Karl T. Compton, president, Massachusetts Institute of Technology, Watson Davis, director, Science Service, Harry N. Holmes, President, AMERICAN CHEMICAL SOCIETY, Eric Hodgins, publisher, *Fortune*, and Ronald Kinnear, president, Society of the Plastics Industry.

Science Briefed for Busy People

CARLOS E. CUMMINGS, Director, Buffalo Museum of Science, Buffalo, N. Y.

IN TODAY'S world, which moves on the research and production of science, chemists are part of that group of scientists upon whom an especially heavy burden of responsibility is laid. These responsibilities demand that they keep up to the minute in their own profession, but in spite of other marvels, no one has found how to stretch the 24-hour day. This often precludes much study or even consideration of other fields of science.

Chemists are not alone in this dilemma, and to solve it, at least in part, the Buffalo Museum of Science has planned its exhibits to tell a connected story, succinctly, of the world in which we live and of the plant life, animals, and men who inhabit it. Here, almost at a glance, you can skim the cream of research and knowledge in the various sciences; here, briefed for busy people, is the fascinating story of our world today, yesterday, and the day before, with even a hint of things to come. The museum is large enough to be comprehensive, but small enough to be friendly; we put the latchstring in your hand and invite you most cordially to pull it when the AMERICAN CHEMICAL SOCIETY meets in Buffalo September 7 to 11, 1942.

You're coming? That's splendid, and so that you can use your time to the best advantage and plan which exhibits you most want to see, let us survey some of the high spots.

The museum's exhibits are like a book. In the great Central Hall is an index—some objects illustrative of the different exhibit halls to attract your attention and whet your appetite. The Central Hall acts as a show window and invites you to enter first one hall and then another for more of the same.

Leading off from this hall are 10 smaller exhibit halls, each dedicated to the story of a single science.

Buffalo Museum of Science

Physics and Chemistry

First and fundamental is the magic Hall of Physics and Chemistry where the wonders of electricity are demonstrated. The photoelectric cell operates and yields its mysteries. High-tension electricity gives up its secrets. The wonder of fluorescent minerals under the invisible ultraviolet light compels admiration. Mystification gives way to rational knowledge in all that is spectacular in these basic sciences, and a demonstrator takes the visitor behind the scenes.

Astronomy

Astronomy follows in the next hall. Here the layman learns about that vastly greater space, beyond reach of our most ambitious travelers, which we call "the universe". The worlds of our solar system trace their orbits in orderly procession in the planetaria. The lore of the star gazer, how he works, what he sees, and what he learns are shown in interest-compelling sequence. Partly dark, but like the evening sky on a cloudless night, the hall is illuminated by numberless points of light illustrating constellations and the bodies that swarm the interstellar spaces. Meteors, comets, nebulae, the storm centers on the sun, the majesty and significance of eclipses, are explained in the light of present knowledge.

Earth Science

In the Hall of Earth Science the earth's history and architecture are illustrated with samples from its crust. The forces that work with and upon the surface to modify it, the processes that have made it what it is today and are still at work explain themselves in a series of groups. The building and destruction of features familiar to us today, how they came about, what will become of them after we are no longer interested in this life, are shown.

Life

Logically following, the Hall of Life explains conditions that enable life to evolve and the simpler forms of life. A triple panel illustrates the life zones of today—the woodland and shallow stream, the desert, the ocean, and where land meets sea. The story of how the body is built of individual cells and the nature of the cell occupy further exhibits.

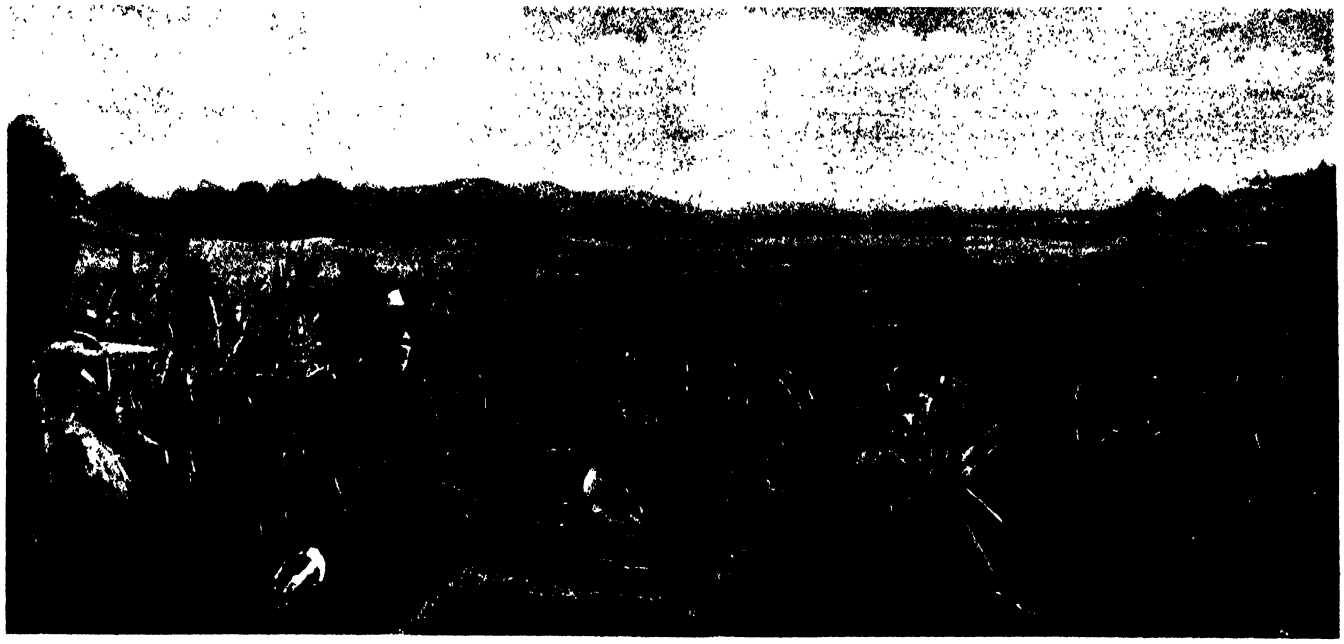
Invertebrates

The next step proceeds to those creatures so low in the scale of existence that they have not yet evolved internal bony frameworks. The Hall of Invertebrates focuses attention upon them, produces

them from every part of the country to round out a conception of their variety and modifications. The visitor cannot but be amazed at the variety of forms animal life has assumed. The sun flits across the bottom sand on a coral reef transported from Bermuda. Here is a garden in which animals as brilliantly colored as ornamental plants provoke admiration. Even the rocky ledges are animals, the waving plumelike fans, the flowerlike ascidians blooming like exotic poker plants; all that appears to be shrubbery and foliage in an underwater garden is animal. Other beautiful groups show that Nature is as prodigal in northern waters as in southern. Further exhibits call attention to the insects, their countless forms, their tremendous numbers. The life in a drop of water from a sluggish stream is modeled in plastics, enormously magnified.

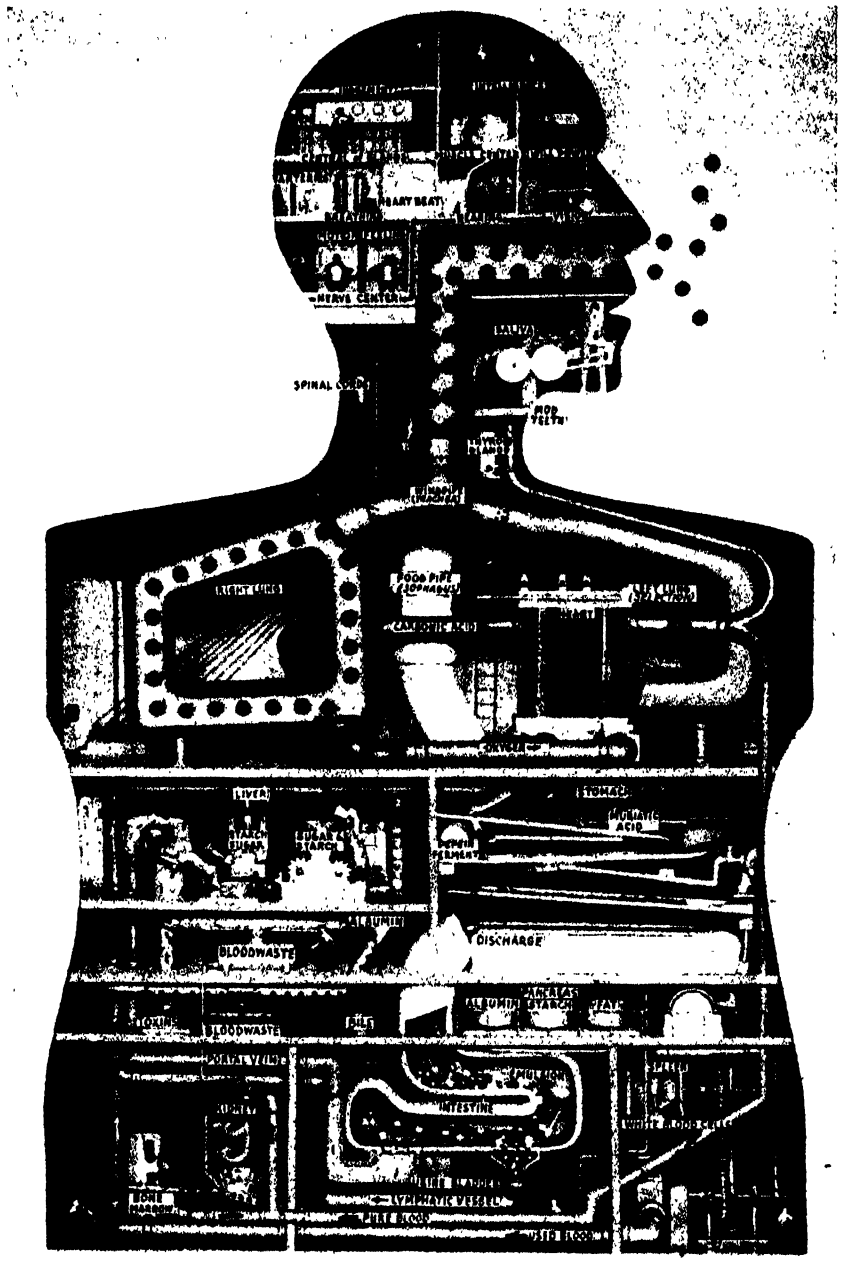
Vertebrates

Across the Central Hall backboned creatures in the Hall of Vertebrates call attention to a different-structured type of life. The odd fishes of the Atlantic Coast are in evidence. Here are some of the more common forms of finny creatures that are sometimes seen locally only as steaks, fillets, or Friday dinner food. Here also are the fabulous monsters of the marine world. Types of animals from the legless lizard to the long-legged, long-necked giraffe demonstrate that all these creatures possess backbones, whether they are covered with scales, hide, hair, or feathers. At the end of the hall full-sized bison rest in a family group on the boundless plains. As far as the eye can see the prairie gently rolls, and more than one visitor has expressed amazement at the illusion of the vast distance.



Evolution

The inventiveness of Nature is brought to attention in the Hall of Evolution. Life is a struggle, and each creature has its set of enemies from which it must protect itself if the species is to continue. The adaptability of nature to every condition under which life can exist is the theme of this hall. Those creatures which cannot adapt themselves to changing conditions, whether the change is gradual or sudden, cease to exist. Here the record of the rocks tells a tragic story of forms that could not adapt themselves quickly enough and became extinct. A scene from the era of reptiles, when great beasts prowled the rank jungles of the steaming marshlands millions of years ago brings to life a chapter in the history of the earth that we can now read only from plants and bones preserved in solid rock. The great variety of animal forms is also stressed. At the end of the room three groups reproduce life found in three vastly different environments. A bit of seaweed from the Sargossa Sea floats on a lazy ocean, a teeming community in which live dozens of different animals, protected from their enemies by their close mimicry of the plants among which they live. If you look very closely, you can count 64 different kinds! From a large porthole the visitor next looks out into the blackness of the ocean depths.



BUFFALO MUSEUM OF SCIENCE

Bog Group, Spaulding Hall of Conservation. Within 50 miles of Buffalo more than 35 kinds of orchids have been found growing wild. Seven kinds are shown here with other characteristic bog plants.

BUFFALO MUSEUM OF SCIENCE

Autumn bird life in the western New York marshes in the Bird Alcove, Hall of the Niagara Frontier

BUFFALO MUSEUM OF SCIENCE

Human Factory, Cabana Hall of Man. This animated model represents, in terms of ordinary factory practice, the various operations essential to maintain life in human beings. Cogs move, pumps operate, and red and blue lights show the course of air.

Press a button, and the denizens of the inky depths begin to come to life. Living in a lightless region they produce their own light. A third group depicts the life of creatures on land in a cave where light never penetrates. A series of buttons flashes beams like those from an electric torch, disclosing ghostly blind fish, crayfish, the little cave salamander, and several species of roosting bats.

Heredity and Environment

The next hall, that of Heredity and Environment, shows among other things how varying factors within the species can give rise to descendants vastly different from the usual form of the group. How man has taken advantage of these factors for variation to improve plants and animals of use to him, to change their forms for special purposes, is well shown. One of the most intriguing exhibits is that series of panels which move on an arranged schedule to present charming baby dolls in a demonstration of the principles of human heredity. We conclude that it behooves us to "fall in love intelligently", but who does?

Man

In the Hall of Man the dominant feature is the Transparent Man. The organs of this superb figure are separately illuminated, enabling the observer to visualize the human anatomy as though possessed of an x-ray eye. The many other exhibits in this hall of health explain in a graphic way the mechanisms and function of the human body and its organs and point the way to longer life and greater efficiency.

Primitive Races

How the extremes of ease and difficulty of living affect the progress of the human race is the theme of the Hall of Primitive Races. Here one sees the methods of life among primitive people in all parts of the world, people who have remained primitive because the conditions under which they live prevent progress. A series of Lilliputian groups depicts the everyday life of primitive peoples from the Arctic Circle to the Tropics and as far south as the southermost tip of South America. Primitive races of the Eastern Hemisphere are contrasted with those of the Western. They have developed no further, in the matter of culture, than the Cro-Magnon man who lived in prehistoric Europe. At the end of the hall these early ancestors of modern races are shown at work in their picture gallery, painting the scenes on the stone walls of caverns by which we know them.

Civilization

The Hall of Civilization near by tells the story of modern progress. The rise of basketry and pottery; the development of tools from bits of chipped stone to steel; the improvements of transportation from back pack to wheels; the simple mechanical principles that underlie our machine age; the use of money; the invention and improvement of the written word; a glimpse of civilizations of other ages; the cultures based upon different types of agriculture; transportation on water and land; modern domestic animals and improved fruits and vegetables—all are treated in striking groups that bring home

BUFFALO MUSEUM OF SCIENCE

Transparent Man in the Cabana Hall of Man

the phases of modern culture and how they have arisen. The story of science culminates in this hall.

Plant Life and Conservation

Three other halls on this main floor are of equal interest. The Hall of Plant Life tells the story of plant development and the world-famous wax models of local wildflowers are so truthful that visitors can scarcely believe they are not still growing. The mushrooms of the region have been modeled in wax with equal artistry. Dominating the hall is a large model which shows by movement the growth of a twig during the period of a year. In the adjacent Hall of Conservation three beautiful life-size groups depict our vanishing wildflowers found in the spring woodland, in a bog, and in the fields during autumn. The world map which covers one entire wall shows the eight regions of the earth which have definite physical and climatic differences and indicates by illumination in rotation their characteristic plant and animal life.

Local Flora and Fauna

In the Hall of the Niagara Frontier is displayed the great variety of life to be found in this locality—birds and animals, fish and reptiles, insects and shells. Several groups recapture the ancient history of the region, bring back to life the days, some millions of years ago, when Buffalo was covered by an inland sea, the climate was that of the Tropics, and coral animals and strange marine creatures were the only inhibitants. An alcove is devoted to the Indians who once roamed the shores of Erie.

And This Is Not All

Two other exhibits must be mentioned, even though briefly. On the second floor the Corridor of Time gives glimpses of art objects through which man has expressed himself and outlines his artistic achievements through 25,000 years. Here the rise and fall of civilizations can be traced from Stone Age days to the recent past. On the third floor the Hall of the South Seas, through artifacts ingeniously contrived, shows the objects used in their every-day affairs by the people who inhabit the South Sea Islands.

The Hall of Aquaria is always a favorite spot, for here life is real, not the result of artistry. Fish, frogs, turtles, and snakes native to western New York live in aquaria and terraria. Even insects, commonly known to the more scientific-minded but puzzling to the average man, pursue their amazing life cycles in special glass-sided cages.

These pages complete a superficial view of the exhibits in the museum and give some idea of how a museum can be brought to life and tell a story. The Buffalo Museum of Science is constantly changing, growing, and, it is hoped, improving. Visitors to the 104th meeting of the AMERICAN CHEMICAL SOCIETY in Buffalo, September 7 to 11, 1942, are cordially invited to be the judges.

Ernest T. Trigg Honored by Paint Industry

BLACKSTONE STUDIOS

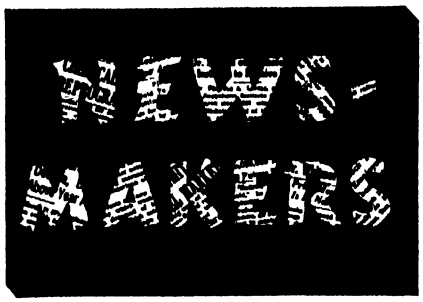
Ernest T. Trigg

ERNEST T. TRIGG, president of the National Paint, Varnish and Lacquer Association, was honored June 30 by the Nation's paint industry with a dinner at the Union League, Philadelphia, Penna., in celebration of his 50 years' service to the industry. Three hundred and fifty leading paint manufacturers from all parts of the country and Canada as well as prominent civic and industrial leaders attended. The dinner was sponsored by the Philadelphia Paint, Varnish and Lacquer Association, and Samuel R. Matlack, president of George D. Wetherill & Co., Inc., acted as honorary chairman. Walter A. Gorrell, president of the Philadelphia association and vice president and general manager of John Lucas & Co., was toastmaster, and guest speaker was Allen A. Stockdale of the National Association of Manufacturers. His topic was "Morale for Victory".

Frank L. Sulzberger, president of the Enterprise Paint Manufacturing Co. of Chicago and vice president of the National Paint, Varnish and Lacquer Association, felicitated Mr. Trigg on his half century of devoted service to the paint industry. George A. Martin, chairman of the board, The Sherwin-Williams Co., paid tribute to Mr. Trigg's contributions by pointing out that no man in the history of the paint industry has done so much to establish fair practice and competitive ethics. Howard W. Hock, president of the Hock Paint Co., presented him with an embossed leather book containing testimonial letters from nearly 100 leaders of the industry, and William H. Jarden, president of McCloskey Varnish Co., gave him a handsome grandfather's clock.

Entertainment for the evening was provided by Frances Greer, lyric soprano of the Metropolitan Opera, and Edward Roecker, baritone of radio, stage, and concert fame. Dinner music was provided by Harold Michelin's orchestra.

Mr. Trigg started his career in the paint industry when he began work as an office boy in 1892 with E. C. Haines, a paint manufacturer's representative in Chicago. Subsequently he worked for the Heath & Milligan Manufacturing Co., becoming general sales manager of the company in 1902. He remained at this post until 1908, when he moved to Philadelphia to become general manager of John Lucas and Co. In 1913 Mr. Trigg was elected vice president of the Lucas company, and in 1922 became president. He resigned this position December 1, 1933, to accept the presidency of the National Paint, Varnish and Lacquer Association, with headquarters at Washington, D. C. Since that time, Mr. Trigg has devoted his entire time to the service of the paint industry nationally and has established many new records for trade association work.



Vassar Graduates Take Technical Positions

STUDENTS of chemistry at Vassar College who received bachelor's degrees in the 1942 class have accepted positions as follows:

Fredericka Berger, medical college.
Betty Jane Cramer, Quaker Chemical Products Co., Conshohocken, Penna.
Marguerite Mellen Dewey, chemical research assistant, Department of Pediatrics, Children's Hospital Research Foundation, Cincinnati, Ohio.
Frances Josephine Edwards, technician, hospital laboratory.
Sarah Snowden Hughes, technician, hospital laboratory.
Jane Power McCollough, medical college.
Barbara Scott Meyer, technical assistant, Bell Telephone Laboratories, New York.
May Orton, Indiana Ordnance Works, Charleston, Ind.
Joan Rothwell, graduate work, Massachusetts Institute of Technology.
Jane St. John, nurses' training school.
Betty Schnee, graduate work.
Argot Stockton, Celanese Corp., Cumberland, Md.
Mary Martin Talmage, Armstrong Cork Co., Lancaster, Penna.
Ruth A. Walker, graduate work, Yale University.

Graduate students are:
Jean Clarke Davidson, Hercules Powder Co., Wilmington, Del.
Mary Elizabeth Saeger, American Cyanamid Co., Stamford, Conn.

Richard Chace Tolman received the doctorate of science on June 16 at the commencement exercises of Princeton University. Dr. Tolman is professor of physical chemistry and mathematical physics at the California Institute of Technology and vice chairman of the National Defense Research Committee.

Recent additions to the staff of Ralph L. Evans Associates, Inc., New York, N. Y., include: **S. A. Bell,** formerly an instructor at Columbia University; **Clifford H. Bundy,** M.S., Princeton University; **Philip Heiberger,** formerly with Colgate-Palmolive-Peet Co.; **John S. McCoy,** New York University; **John F. Mulvaney,** formerly instructor at New York University; and **Florence M. Thein,** B.S., Mt. St. Vincent College.

Edward M. Collins, assistant professor of physical science at Kent State University, Kent, Ohio, has been granted a leave of absence so that he may serve as visiting assistant professor of chemistry at Williams College, Williamstown, Mass.

Charles C. Concannon, U. S. Department of Commerce consultant on chemicals, has been named chief of the Durable Goods and Materials Unit, Bureau of Foreign and Domestic Commerce. Mr. Concannon succeeds **Phillips A. Haywood** who resigned to accept a post in the Navy.

J. B. Davis, chief of the Protective Coatings Section of the War Production Board's Chemicals Branch, has been loaned to Brazil for the development of babassu nut oil in the Amazon area. **E. H. Bucy** replaces Mr. Davis as chief of the section. **Wells Martin** has been appointed assistant chief, and **M. Rea Paul** becomes special technical assistant to Mr. Bucy.

Herman K. Eckert, plant manager of the Nitro, W. Va., plant of the Organic Chemicals Division, Monsanto Chemical Co., has been appointed plant manager of the synthetic rubber raw material plant being constructed by the company for the Rubber Reserve Co. in Texas. **Charles S. Comstock,** production staff of the Merrimac Division, has been appointed production superintendent.

W. C. Fernelius has left Ohio State University to assume a professorship at Purdue University.

Gilbert E. Goheen has resigned his position as chemist in the Experimental Division, Sun Oil Co., and joined the Process Development Department, General Aniline Works Division, General Aniline and Film Corp., New York, N. Y.

Nathan H. Koenig has been transferred to the Green River Ordnance Plant, War Department, in Illinois, as inspector of powder and explosives. He was formerly at the Western Regional Research Laboratory, Albany, Calif.

Charles A. Mabey has been appointed director of the research activities of the Bristol Co., Waterbury, Conn. Mr. Mabey has served the company for several years as physicist.

Robert E. Mason has been appointed representative of The Mixing Equipment Co. for North and South Carolina.

Harvey M. Merker, superintendent of manufacture, Parke, Davis & Co., Detroit, Mich., has been re-elected to the presidency of The Engineering Society of Detroit. Other officers are: **E. C. Balch,** first vice president; **T. A. Boyd,** second vice president; **A. H. Lovell,** secretary; **Glenn Coley,** treasurer; and **George R. Thompson,** assistant treasurer.

Paul L. Munson, who recently completed the requirements for the Ph.D. degree at the University of Chicago, and **Ernest E. Spinner,** who recently received his B.S. from Tri State College, have been added to the staff of the Wm. S. Merrell Research Laboratories, Cincinnati, Ohio.

Grover C. Mutchler, plant superintendent of Mack Printing Co., Easton, Penna., celebrated 40 years of service on June 1. CHEMICAL AND ENGINEERING NEWS wishes to congratulate Mr. Mutchler and thank him for his many services to it.

J. Ernest Nachod, Jr., has been transferred by the Hercules Powder Co. from Hercules, Calif., to the Missouri Ordnance Works. He is operating supervisor in ammonia operations.

James V. O'Leary, central division manager for the Commercial Solvents Corp., has reported for active duty as an officer in the Chemical Warfare Service.

George W. Perkins has been granted a leave of absence by Merck & Co., Inc., to serve as lieutenant colonel in the Chemical Warfare Service, Washington, D. C.

J. T. Power has recently gone to the Ravenna Ordnance Plant, operated by the Atlas Powder Co. in Ohio, where he is acting as general manager.

Laurence L. Quill has been appointed to the headship of the department of chemistry, University of Kentucky, effective in September. He has been at Ohio State University since 1935. **Ralph N. Maxson** has requested to be relieved of his administrative duties as head of the department and to continue his teaching.

Eugene E. Rodabaugh, formerly with the Champion Paper and Fiber Co., Hamilton, Ohio, has accepted a position with the Crossett Lumber Co. Research Laboratory, Crossett, Ark., where he will work in the pulp and paper division.

J. G. Ryan is on military leave from the Wood River, Ill., research laboratories of Shell Oil Co., Inc., serving with the 58th Armored Field Artillery, 5th Armored Division.

E. A. Rykenboer

E. A. Rykenboer, general manager of the Electrochemicals Department of E. I. du Pont de Nemours & Co., Inc., completed 25 years of service with the company on July 2 and was honored at a dinner given at the Hotel Niagara by du Pont's Niagara Falls 25-Year Club. **W. S. Carpenter, Jr.,** president of the company, presented Dr. Rykenboer with his 25-year service pin. More than 300 employees attended the affair.

William J. Weckler has been promoted from first lieutenant to captain and has been transferred from assistant utilities officer to utilities officer, Army Air Forces Technical School.

Earl A. Wellmuenster, who received his Ph.D. from St. Louis University in June, is now doing organic research for Cleveland Industrial Research, Inc., Cleveland, Ohio.

Plan on Buffalo

WHETHER or not a meeting is justified in these days of inadequate transportation and transient housing problems depends much on the type of meeting and what it may accomplish. Our readers will be pleased to know that there has been no serious indication that the annual meeting of the AMERICAN CHEMICAL SOCIETY, scheduled to begin September 7 in Buffalo, N. Y., will need to be postponed or canceled. It will be remembered that during World War I meetings of the SOCIETY were encouraged by the authorities, and it seems now to be recognized that it is helpful to the war effort to bring together the scientists who are always attracted by the opportunity to exchange views with their fellows, to hear discussions, and to make new acquaintances. Those responsible for the meeting are going ahead with their plans and, in addition to developing a program expected to be very helpful to the war effort, and recognized as such, extra interest will be attracted by features now being arranged.

We are able to announce now that a public meeting is being planned for the night of Monday, September 7, at which President Holmes will deliver his presidential address on "National Survival through Science" and C. M. A. Stine, member of the executive committee of E. I. du Pont de Nemours & Co., Inc., will speak on "Molders of a Better Destiny". These will be outstanding addresses to which it is planned to admit the general public. Lieutenant-General William S. Knudsen, in charge of War Department production, will be the principal speaker at the banquet Wednesday evening.

There are many reasons why you should make early reservations, not only for your living accommodations in Buffalo but for your transportation to and return from that city. This is one of those occasions when those who make late decisions are almost certain to find themselves without the pale.

Gas Protection Instruction Offered at Florida

THE University of Florida in cooperation with the State Defense Council has given instruction on chemical warfare gas protection to 1,751 persons in 47 of the 67 counties in the State. Gas instruction is offered as a part of a basic program of training for volunteers in the action groups of defense councils. Programs to reach the remaining 20 counties are being planned.

The main purpose is to develop instructors who can go back to their own communities and tell the people what they need to know to protect themselves in a gas attack. Among those who attend are many with sufficient training in chemistry and allied fields to give gas instruction locally. Teaching aids, such as outlines, objective tests, etc., are given to such potential instructors, and the program is presented in the form in which they are expected to give it to the people back home.

Instructors have been largely drawn from the University of Florida faculty. Fred H. Heath, professor of chemistry and a major in the Chemical Warfare Reserve, has done the greater part of the lecture work. W. H. Beisler, head professor of chemical engineering and a lieutenant colonel in the Chemical Warfare Reserve, and LeRoy D. Edwards, head professor of pharmacognosy and pharmacology, have appeared on several of the programs. Other assistance has been given by R. J. Longstreet, supervising principal of the Daytona Beach Schools, who has had a War Department Training Course at Texas A. & M. Chemical Warfare officers at posts near the instruction centers have assisted by conducting students through the gas chamber exercises and by giving lectures on the use and care of gas masks. Students are furnished gas masks and are directed through the same gas mask drills prescribed for men in the armed services. The officers conduct gas identification drills by using sniff sets and field tests.

Future plans for instructing civilians on chemical warfare agents include special programs for gas casualty station personnel on the decontamination of individuals. Dr. Heath will again handle the major portion of the instruction. He will be assisted by C. R. Hughes and G. Manuel Turner of the General Extension Division staff, who have recently completed the program of training at the War Department Civilian Protection School conducted at the University of Florida. Demonstrations of hypothetical situations will be consistently staged in connection with these programs to enhance their learning value. All the programs are directed by B. C. Riley, coordinator of training for the State Defense Council and dean of the General Extension Division.

Pump for Extinguishing Bombs Uses no Strategic Materials

NO STRATEGIC materials are used in the construction of a patented pump for extinguishing bomb fires, developed by Zadig Patents, research organization of South Norwalk, Conn. Designed to replace stirrup pumps, manufacture of which has been delayed because priority metals are required, the new device is made entirely of wood and fabric. The two lengths of hose used are of fabric.

ELECTROMET REVIEW, ELECTRO METALLURGICAL CO.

Stainless Steel Mercury Condenser System

This installation of stainless steel tubing is used for condensing vaporized mercury extracted from cinnabar and other mercury-bearing ores at the Cordero Mining Co. near McDermitt, Nev. The tubes condense the vaporized mercury that is passed into them from the furnace in which the mercury ores are roasted. The stainless steel, a molybdenum-bearing variety, is said to be the most satisfactory material yet used in the condensing equipment. It combines relatively high heat transmission with excellent resistance to the corroding effect of mercury and acid fumes. The equipment was fabricated by the Grand Metal Products Corp., Portland, Oreg.

POTOMAC POSTSCRIPTS

Price Regulations

Agar. The maximum price for agar produced and sold by the San Diego plant of the American Agar and Chemical Co., sole domestic producer selling the product in commercial quantities, has been established at $3.00 per pound, f.o.b. San Diego, Calif.

The American Agar and Chemical Co. began to manufacture the product at its San Diego plant last April. As neither this seller, the San Diego plant, nor a competitor of the same class sold agar during March, the base period for setting maximum prices under the General Maximum Price Regulation, the ceiling price for it was established under Section 3(b) of the over-all regulation. The price is authorized in Order 18, and was issued under Section 1499.3(b) of the General Maximum Price Regulation.

Bauxite. Increased bauxite production in southern ore fields was forecast by the action of the Director of Industry Operations in placing bauxite and alumina under complete allocation control. The action, taken by issuance of Order M-1-h, was made necessary by the rapid increase in aluminum production and the increasingly serious shipping situation. Purpose of the order is to conserve high-grade bauxite, that containing less than 15 per cent silica, for the manufacture of products needed for war.

Both Arkansas and imported bauxite containing less than 15 per cent silica will be allocated primarily for the manufacture of aluminum, abrasives, and aviation gasoline. Restricted as well as nonrestricted grades mined in Alabama, Georgia, Virginia, Tennessee, Mississippi, and other states from small and scattered deposits will be permitted a more general use, such as the manufacture of chemicals and refractories.

The order, which is effective August 1, gives consumers of restricted bauxite and alumina until September 1 to use up materials on hand, provided the amount used between July 1 and August 31 does not exceed one third of the amount so used during the last six months of 1941. Consumers of bauxite must file requests for allocation on Form PD-567 and alumina users on Form PD-568.

Calcium Hypochlorite. To ensure adequate supplies of high-test calcium hypochlorite and chloride of lime, commonly known as bleaching powder, for civilian defense gas decontamination and for essential uses of the Army and Navy, the entire supply has been put under complete allocation control. In an amendment to the Chlorine Order M-19, high-test calcium hypochlorite and chloride of lime were specifically exempted by changing the definition of products covered. Concurrently, Supplementary Order M-19-a was issued, which states that no high-test calcium hypochlorite or chloride of lime can be delivered by a producer without specific authorization. Each producer must file Form PD-574 with WPB on or before the 10th of each month stating his desired shipments for the following month.

Chromium. M-18-a, the chromium allocation order, has been extended indefinitely. It was due to expire on June 30, and the extension was made retroactive to that date.

Containers. An interpretation of the position of the Office of Price Administration with respect to deposit charges for containers of commodities on which ceiling prices are established under the General Maximum Price Regulation has been made public. Containers to which the interpretation applies include bottles, barrels, drums, kegs, carboys, cloth bags, boxes, and the like. While the interpretation applies directly to containers of commodities sold under the General Maximum Price Regulation, the same general principles apply to charges for containers of commodities covered by other OPA price regulations, but a base level other than March usually will be used.

Where a deposit charge was made for the container in March 1942, the charge may be continued, and may be increased over the amount charged in March provided the amount of the charge is not excessive. Where no deposit was made in March for the container, the seller may not require a deposit charge in addition to the price which was in effect in March unless it was customary for the buyer to return the container to the seller. If the custom existed, the deposit charge which may be made must not be excessive. However, a seller may impose a deposit charge when none was made in March and there was no custom of return, if at the same time he lowers his price, provided the deposit charge is made in good faith for the purpose of obtaining return of the container and the deposit charge is not excessive. If a seller may and does impose a deposit charge under the above conditions, he must deduct from his March price for the container and contents an amount at least equal to the March 1942 value of the container after emptying. Where a deposit charge may be added, it may exceed the deduction in price provided the charge is not excessive. Whether a deposit charge is excessive depends upon the circumstances in each case. A deposit charge will never be excessive if it does not exceed the deposit charged in March, or the seller's reduction in his March price, or the seller's cost of replacing the container. If the container is readily replaceable and is easily destroyed or lost, or if it is sold for shipment out of the country and hence will not be returned, the deposit charge normally may not exceed the highest of these three amounts. If the container is difficult to replace because of a shortage of the material of which it is made or diminution of production, the deposit charge can well be higher than the replacement cost, the reduction in price, or the March charge. If the replacement difficulty is great, the deposit charge can well be much higher than any of these standards, especially if, as will ordinarily be true in such cases, the container is not fragile. In short, the deposit charge must be designed to induce return and must be set at a level fixed with reference to the need for return. It may not be set at a spuriously high level designed to allow seller an extra profit by virtue of inevitable breakage or loss. Because steel drums cannot be replaced with new drums at any cost, a deposit as high as $6.00 on an 18-gage 50- to 58-gallon steel drum is not excessive. The amount of the deposit permissible for steel drums of other sizes and gages may be determined in line with the $6.00 figure.

Graphite. Changes in Order M-61 covering the use of Madagascar flake graphite permit jobbers to acquire crucibles made of this material without application for authorization to do so. Control is retained by WPB because the jobber may not deliver any crucibles without specific authorization. Applicants for crucibles containing Madagascar flake graphite must use, after August 1, Form PD-575 instead of PD-1A. Applicants for this grade of graphite to manufacture crucibles will continue to use PD-303B. The amendment redefines Madagascar flake graphite as that mined in Madagascar of a grade that will stand on a 35-mesh screen.

Iron and Steel. Appeals by manufacturers for relief from restrictions imposed by General Conservation Order M-126, which banned the use of iron and steel in the production of hundreds of common civilian articles, will be passed upon by a new Appeals Branch, set up within the Bureau of Priorities to handle all requests for exceptions to conservation and limitation orders. For the time being, the Appeals Branch will consider only requests from firms affected by M-126. Later, it will take over the handling of appeals from manufacturers covered by certain other conservation and limitation orders, but in the mean-

time queries and requests concerning these should be addressed, as formerly, to the appropriate material or industry branch.

Appeals from terms of General Conservation Order M-126 must continue to be made on Form PD-437 and filed with the nearest WPB field office. After a preliminary processing in the field offices, the appeals will be forwarded to Washington for final decision. Communications concerning M-126, other than the filing of appeals, should be addressed to the Appeals Branch, Bureau of Priorities, War Production Board, Washington, D. C.

Mercury. Maximum prices for mercury established in Revised Price Schedule 93 apply to every grade and kind of mercury sold in 76-pound flasks, and these prices apply pro rata to mercury sold in all containers of more than 25-pound capacity. All kinds and grades of mercury sold in containers of 25-pound capacity or less must be bought and sold for not more than the normal differentials from such maximum prices prevailing between October 1 and October 15, 1941. This was made clear by the issuance of Amendment 1 to the schedule.

Previously the schedule established maximum prices for prime virgin mercury and provided that all other kinds and grades should be sold at their normal differentials from such maximum prices. This was not intended, however, to permit the sale of mercury in 76-pound flasks at a premium on account of any claimed superiority to prime virgin mercury. The maximum prices established were designed to allow a liberal price for the highest quality of mercury sold in 76-pound flasks, and the differentials were to apply only to mercury sold in the smaller containers. Maximum prices remain the same as before the effective date of Amendment 1.

Steel Alloys. Heat-resistant steel alloys have been scaled down to a wartime basis to conserve two critical metals, nickel and chromium. Order M-21-g sets up maximum specifications for heat-resistant alloys used in metallurgical furnaces, oil refineries, synthetic rubber plants, cement mill furnaces, and power plant equipment. The new specifications are designed to use the least possible amount of alloying materials necessary to maintain the effectiveness of the equipment involved. Savings in nickel are expected to be in excess of 10 per cent of the annual consumption. The order does not apply to heat-resistant steels for the armed services where specifications call for more nickel and chromium than the schedules set up in the order.

Toluene. Companies with stocks of toluene on hand and who have been granted authority by the War Production Board to release these stocks to certain producers have been requested to observe a maximum price of 2 cents per gallon plus the delivered cost of the toluene. All stocks of toluene in the hands of persons who would normally have used such stocks as diluents in protective coatings were frozen under General Preference Order M-34 as of February 1, 1942. The Director of Priorities has commenced releasing these stocks to such persons as producers of TNT and DNT. The companies to whom this price request was made and their competitors do not ordinarily sell toluene and had no basis for determining maximum prices under the General Maximum Price Regulation.

WPB Activities

HUNDREDS of thousand of tons of critical materials now frozen in idle inventories will be freed for vital war production by a regulation issued by the War Production Board. The new order, Priorities Regulation 13, affects thousands of business concerns which have in their possession materials which cannot move freely in industrial channels because of existing war regulations. In effect, Regulation 13 sets up new and uniform rules governing the sale of idle inventories of certain kinds and removes such specified sales from the existing regulations which affect the normal flow of material. No specific estimates of the amounts of materials which can be salvaged in this way are available. However, the total is known to be extremely large, and in the case of copper and copper base alloys alone, for example, it is believed that some 250,000 tons of this war metal can be freed by the new step.

An example of the simplified procedure effected by Regulation 13 is afforded by the case of a domestic refrigerator manufacturer who had on hand a large stock of copper tubing when prohibition of any further refrigerator production became effective. The tubing was badly needed by a firm in the same city which was turning out tank assemblies. By the terms of Limitation Order L-5-c, transfer of the critical material could not be made until official approval, obtainable only after application to WPB, had been secured. Under the new order such a sale may be made without formalities of any kind. The seller would not even be required to make a report of it. During the period of emergency conversion to war production, it was necessary at times to immobilize some stocks of scarce material. Now that the conversion program is well under way, the flow of these materials into the war effort can be greatly increased.

Reserved for specified purchasers is "war material", consisting of some 150 materials listed in Schedule A to the Regulation. This material may be sold to the armed services, Maritime Commission, and certain other government agencies. In addition, sales of war material, as defined, may be made to persons who belong to a class listed in Schedule A as eligible to receive it. In general, authorized sales, in addition to those to specified government agencies, are "up-stream" sales, to distributors or manufacturers, or by manufacturing users to producers of raw materials. This serves to restore them to normal distribution channels. Applications for specific sales not covered by the general provisions of Regulation 13 should be filed on Form PD-470 at the nearest WPB field office. Sales of less than $100 may be made to anyone. Materials not listed on Schedule A may be purchased by anyone authorized by existing regulations to receive and make specified uses of them. It is pointed out in the new regulation, however, that its terms do not exempt a purchaser from end-use and quota restrictions. Any purchaser acquiring war materials as a result of a type of sale authorized by Regulation 13 must comply with all inventory, quota, and use restrictions imposed by all other orders and regulations.

War Research Cost Estimated at $57,730,578

THE large amounts being spent by the Office of Scientific Research and Development, Washington, to aid in war production were revealed by Karl T. Compton before the meeting of the American Association of Physics Teachers at Pennsylvania State College June 25.

Dr. Compton, president of Massachusetts Institute of Technology, in charge of the OSRD Division on Detection Controls and Instruments, said that up to May 6, $57,730,578 had been spent for 663 contracts with 94 educational institutions and for 338 contracts with 110 companies. The figures, Dr. Compton added, were authorized for release by Vannevar Bush, chairman of OSRD.

Although it is impossible to say the exact number of scientists engaged on the contracts in educational institutions, Dr. Compton put a reasonable guess at 7,500. The personnel of OSRD, including committee members, technical aids, and consultants, totals 750. Of the 663 contracts, 300 related to chemical investigations.

Allocations to American Republics Announced

THE Department of State, War Production Board, and Board of Economic Warfare have announced the following list of commodities allocated to the other American republics for the third quarter of 1942:

Acetic acid, acetone, aconite, ammonium sulfate, anhydrous ammonia, aniline, ascorbic acid, bauxite, belladonna leaves, belladonna root, beryl and beryllium,

cadmium, camphor, carbon tetrachloride, castor oil, chlorine, citric acid, cobalt, copper, cotton linters, diamond dies, dibutyl phthalate, digitalis, dynamite, carbon and graphite electrodes, ergot, fluorspar, formaldehyde, glycerol, natural amorphous graphite, insulin, ipecac, lead, leather, ferromanganese, mercury, methanol, ferromolybdenum, naphthalene, neat's foot oil, phenol, phosphorus, phthalic anhydride, platinum and allied metals, potassium permanganate, procaine, rayon (filament yarn), red squill, strontium chemicals, sulfaguanidine, sulfanilamide, sulfuric acid, superphosphate, thiamin hydrochloride, toluene, ferrotungsten, uranium salts and compounds, ferrovanadium, and zinc.

Alien Property Custodian Appoints Dyestuff President

LEO T. CROWLEY, Alien Property Custodian, has announced selection of Louis Johnson to serve as president of General Dyestuff Corp., New York. Control of General Dyestuff was seized by the Custodian on July 6. Colonel Johnson, Assistant Secretary of War from 1937 to 1940, has just returned to the United States from India, where he went in his capacity of personal representative of President Roosevelt.

Management of General Dyestuff is linked closely to the war effort, and Colonel Johnson's selection as president was dictated largely by his unique knowledge of Army requirements and of the international ramifications of the present conflict, Mr. Crowley stated. A resident of Clarksburg, W. Va., Colonel Johnson is one of the country's outstanding lawyers and administrators.

Appropriation Speeds Work on Chromium Output

AIDED by a $75,000 appropriation from Congress, the U. S. Bureau of Mines has embarked on more intensive studies of processes developed by its metallurgists to increase the Nation's output of chromium. Two processes, which appear destined to speed the flow of chromium to war plants in unprecedented volume from domestic sources, are a beneficiation process for low-grade ores which has successfully passed all tests made so far and has proved to merit large-scale pilot tests to determine optimum operating conditions for commercial use and an electrolytic method for recovering high-grade chromium metal from domestic ores.

In seeking more effective means of recovering chromium from the extensive deposits of low-grade chromite ores, particularly in western states, the bureau is operating several pilot plants in its laboratories at Boulder City, Nev. Mining engineers of the bureau are engaged in still further explorations of chromite deposits, and this work will take them to Alaska, California, Montana, Oregon, and Washington.

Bureau of Mines Reorganized

REORGANIZATION of the essential operating structure of the U. S. Bureau of Mines to speed the expanded program of providing strategic and critical minerals for the Nation's war needs has been announced. Three regional offices are being established at Salt Lake City, Utah, for the western states, at Rolla, Mo., for the central states, and at College Park, Md., for the eastern and southern states. Each office will be headed by a regional engineer and an assistant regional engineer, whose functions will be to supervise, initiate, and execute approved investigations leading to the more rapid use of mineral resources in the region under their supervision. Under jurisdiction of the regional engineers will be district engineers assigned to states or districts within the respective regions, project engineers, other technologists and scientists, and clerical and laboratory help. The regional engineers, under terms of the order, will take over all the functions and duties in the field previously assigned to the Mining, Metallurgical, and Nonmetals Divisions of the Technologic Branch, which are now abolished. To advise the office of the Director and to perform fact-finding functions and handle reports from the regional engineers, a Resources and Laboratories Service, containing a Mineral Processes Division, a Mining Division, and a Laboratories Planning Division, has been established with a small staff in Washington.

The order also provides for establishment of a Fuel and Explosives Service within the bureau, which will take over the Coal Division, the Petroleum and Natural Gas Division, and the Explosives Division, all of which were part of the abolished Technologic Branch. Operation of the helium plant at Amarillo will be under the jurisdiction of the Petroleum and Natural Gas Division, as formerly. All laboratories working exclusively on petroleum or exclusively on coal will also operate under the chief of the Fuels and Explosives Service, as will sections of other laboratories devoted to petroleum, gas, or coal. Other laboratories are transferred to the appropriate regional offices.

The Health and Safety Service of the bureau remains unchanged and will continue to include the Health, Safety, Coal Mine Inspection, Explosives Control, and Mineral Production Security Divisions.

Trona Deposit Discovered in Wyoming

THE U. S. Bureau of Mines has reported discovery of a large deposit of trona, a natural sodium carbonate plus almost unlimited resources of common salt, in Wyoming. The discovery will help supply the wartime needs for soda ash, particularly on the Pacific Coast. The deposit is 20 miles west of Green River, Wyo.

Bureau of Mines to Build Electrodevelopment Laboratory

A $500,000 electrodevelopment laboratory, where U. S. Bureau of Mines metallurgists plan to study the recovery and processing of minerals from the Pacific Northwest with electrical energy from Bonneville and Grand Coulee Dams, will be established in that region within the near future, it is reported by the bureau. With part of the funds just appropriated by Congress for the Interior Department, the bureau proposes to build and operate the new laboratory somewhere within a reasonable distance of the two government power plants to provide a long term and diversified market for large supplies of energy. As soon as a location is selected—probably within a radius of 200 miles of Bonneville and Grand Coulee Dams on the Columbia River—erection of the laboratory will be started, it is said.

The new station will be known as the Northwest Electro-Development Laboratory and will be staffed by 40 or 50 metallurgists and assistants. It will be equipped with electric furnaces and electrolytic cells of various types, ore-crushing and concentrating machinery, chemical laboratory and machine shop equipment, and other miscellaneous installations. Operation of the completed laboratory will be in charge of R. S. Dean, assistant director of the bureau, with headquarters in Washington, D. C.

Investigations will be directed, among other things, toward improving existing or developing new methods of recovering magnesium metal from magnesite deposits. Production of aluminum from the abundant clays and alunite of that region will be probed thoroughly, as will methods to produce ferroalloys from tungsten, vanadium, manganese, and chromium ores.

Mineral Deposits Located

MINERALOGISTS of the U. S. Bureau of Mines are reported to have uncovered new sources of tungsten, chrome, antimony, and mercury. Drilling indicates the availability of 10,00,000 tons of manganese ore not previously known to exist.

THE expanded 1941 program of national defense plus Lend-Lease aid to nations allied in fighting aggression caused a greater demand for zinc in the United States in 1941 than ever before, with a resultant record-breaking production from both domestic and foreign ores, according to the U. S. Bureau of Mines. Requirements, which were heavy prior to the declaration of war in December, have already increased in 1942 with indications of even further advances for the duration.

NECROLOGY

Bruce G. Baldwin

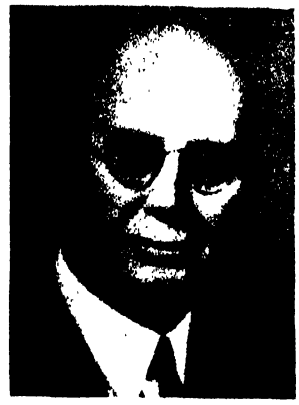
BRUCE G. BALDWIN, chemist in the research laboratories of the Standard Oil Development Co., Linden, N. J., was injured fatally July 3. He was struck by the heavy door of an Army tank on which he was conducting experimental work, and died shortly after being admitted to St. Elizabeth Hospital. Mr. Baldwin, who was 29 years old, joined the AMERICAN CHEMICAL SOCIETY in 1939.

Adolph E. Bernhard

WORD has been received of the death of Adolph E. Bernhard, for 30 years head of the Chemistry Department at the LaCrosse State Teachers College in Wisconsin. Funeral services were held in Lake Geneva, Wis., June 24. Professor Bernhard received his doctorate at the University of Chicago in 1894 and was a classmate of Woodrow Wilson at the Johns Hopkins University.

Charles E. Caspari

CHARLES E. CASPARI, dean of the St. Louis College of Pharmacy, died June 9 after an illness of several months.



Dr. Caspari was born in Baltimore, Md., in 1875 and received his primary education in Baltimore. He received his A.B. and, in 1900, his Ph.D. degrees from The Johns Hopkins University and in 1900–01 was assistant in organic chemistry at Columbia University. In 1901 he accepted a position as research chemist with the Mallinckrodt Chemical Works in St. Louis and in 1903 became professor of chemistry in the St. Louis College of Pharmacy, where he taught until 1930, then becoming emeritus professor of chemistry. He became dean of the College of Pharmacy in 1926 and held that position until the time of his death. From 1910 to 1940 he served as a member of the Revision Committee of the U. S. Pharmacopoeia. For many years he acted as consulting chemist to large manufacturing firms.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1904 and also belonged to the American Pharmaceutical Association, American Association for the Advancement of Science, Franklin Institute, and Missouri Pharmaceutical Association.

Richard Morton Cone

ON JUNE 5, Captain Richard Morton Cone was killed in an airplane accident while on active duty in Australia. He was born in Richmond, Va., in 1907 and completed the undergraduate course in chemical engineering at Virginia Polytechnic Institute in 1928. After his graduate career at the University of California, Dr. Cone was for some years head of the Chemical Department of Philip Morris and Co. at Richmond, and subsequently entered the Research Laboratory of the Solvay Process Co., Syracuse, N. Y. Last September he left this position for active service at Edgewood Arsenal, and from there he was ordered to Australia this spring. Dr. Cone had been a member of the AMERICAN CHEMICAL SOCIETY since 1932 and had served as local section secretary.

Henry G. Knight

HENRY G. KNIGHT, head of the Bureau of Agricultural Chemistry and Engineering, U. S. Department of Agriculture, died in Washington, D. C., on July 13 after a short illness. He was 63 years old.

Dr. Knight was born at Bennington, Kans., in 1878 and took his bachelor's and master's degrees at the University of Washington. In 1917 he received a Ph.D. degree in chemistry from the University of Illinois. He also studied at the University of Chicago and at Cornell University. He taught chemistry for several years, then became state chemist of Wyoming. He was later dean of the Oklahoma Agricultural and Mechanical College and dean of the College of Agriculture of West Virginia.

In 1927 he was appointed chief of the Bureau of Chemistry and Soils, Department of Agriculture, now the Bureau of Agricultural Chemistry and Engineering. In the past few years an important part of his work has been organizing and establishing the four Regional Research Laboratories provided for by Congress in 1938.

Dr. Knight had been a member of the AMERICAN CHEMICAL SOCIETY since 1915. He was a past president of the American Institute of Chemists, whose medal he received in 1941 "for noteworthy and outstanding service to the science of chemistry". Secretary Wickard in speaking of his loss praised his work in establishing modern agricultural research centers and in fostering the development of scientific agriculture.

George W. Rolfe

GEORGE W. ROLFE, retired chemist, teacher, and author, and formerly on the faculty of Massachusetts Institute of Technology, died June 21 after a short illness. He was 76 years old. Born in Cambridge, Professor Rolfe was graduated from Harvard in 1885. After serving as a chemist with a Chicago glucose firm, he was appointed submaster of Brookline High School in 1889. He was instructor in chemistry and sugar analysis at M. I. T. from 1895 to 1915, and at several periods in between was employed as a sugar expert by firms in Puerto Rico. Professor Rolfe wrote and collaborated on many scientific papers on engineering and industrial chemistry. He had been a member of the AMERICAN CHEMICAL SOCIETY for 49 years

Victor E. Ruehl

VICTOR E. RUEHL, Merck & Co., Inc., Rahway, N. J., died June 16 at his home in Caldwell, N. J., after an extended illness. A veteran of the Spanish-American War and World War I, Colonel Ruehl had devoted the greater part of the past 10 years to exploration and research in the Far East and Latin American countries for the purpose of increasing the supply of cinchona bark on this hemisphere. Several years ago he was loaned to the Government by Merck to survey cinchona production facilities in Latin America. Under his direction activities were revived in the lands of the Inca and the Maya, from which the quinine-bearing bark was first obtained.

Born in 1881, Colonel Ruehl enlisted as a private in the war against Spain and, while serving in the Philippines, he began to acquire a knowledge of tropical plants. He attended the University of Indiana and graduated from the University of Indiana Law School, served for several years on the editorial staff of the American Law Book Co., and re-enlisted in the Army in 1917. At the end of the war Colonel Ruehl was engaged in special work for the Secretary of War in the Far East, and his recognition of the dependence of the United States on the Far East for supplies of quinine led eventually to his association with Merck.

John Albert Scherrer

JOHN ALBERT SCHERRER, who retired in 1940 as chemist at the National Bureau of Standards, died June 27 at his home in Chevy Chase, Md. He was 71 years old.

Mr. Scherrer was born December 6, 1870, at New Cambria, Mo., and received his education at the University of Nebraska. Previous to his entry into government service, he had been a chemist

for the Union Consolidated Oil Co., Los Angeles, and for the Cockerill Zinc Co. of Kansas. He joined the staff of the National Bureau of Standards in 1911 and retired with the rank of chemist on his 70th birthday. Because of his wealth of analytical chemical experience, he was recalled shortly afterward to assist in national defense research.

Mr. Scherrer's specialty at the bureau was the chemical analysis of nonferrous metals. Although he did not publish extensively, his real attainment lay in his intimate knowledge of how to make analytical separations and in his ability to turn out a large volume of careful work. Slim and wiry, at the age of 70 Mr. Scherrer was still able to demonstrate how to walk on one's hands. His youthful attitude of mind was reflected in his interest in young people. Modest in his accomplishments, retiring in his habits, he was yet warm and friendly, and won the hearts of his associates. On the occasion of his retirement, he was presented with a set of clockmaker's tools, to pursue a hobby inherited through his Swiss ancestry.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1907 and was also a member of the Washington Academy of Sciences and American Association for the Advancement of Science.

Andrew Stewart

ANDREW STEWART, 73, retired member of the staff of the U. S. Bureau of Mines, died June 29 in Washington, D. C. He had been ill for a year.

At the time of his retirement in 1933 Dr. Stewart was assistant to Mr. Cattell, chief engineer of the Helium Division of the bureau. He was author of various publications, including "About Helium", published by the bureau and considered an authoritative reference work. During his association with the bureau Dr. Stewart served for about 10 years on the Interdepartmental Patent Board. Before entering government service, he established, in association with the late George W. Johnston, a clinical laboratory, said to be the first in Washington. He was born in Washington in 1868, and attended Leipzig University in Germany, where he received the degrees of master of arts and doctor of philosophy.

Dr. Stewart had been a member of the AMERICAN CHEMICAL SOCIETY since 1920 and also belonged to the Washington Academy of Sciences and American Association for the Advancement of Science.

Wanted: Metallurgists and Chemists

IN THE mobilization of manpower for the civilian war service of the Government there is a continuing call for scientifically and technically trained men and women. Among those wanted are metallurgists and chemists. More than 100 metallurgists will be needed during the coming year in the U. S. Bureau of Mines, and the need for chemists in various branches of the Government is constant.

The Civil Service Commission has recently modified the requirements to allow college teaching to be offered as professional experience. The requirements now are a four-year college course leading to a bachelor's degree, with major study in metallurgy, chemistry, or closely allied subjects; for the $2,600 grade, two years of professional experience (which may include college teaching), appropriate graduate study, or a combination of the two in the field for which application is made. Additional experience will be required for the higher grades. Salaries range from $2,600 for the assistant grade to $5,600 for the principal grade. There is no maximum age limit.

Although many of the metallurgical positions require field work, involving outdoor duties for which men will be needed, it is expected that there will also be an opportunity for a number of women. There is an excellent opportunity for women chemists.

Applications for these positions will be received until further notice, but persons who are available and qualified are urged to apply at once. The announcement with the application forms may be obtained at any first- or second-class post office or from the U. S. Civil Service Commission, Washington, D. C.

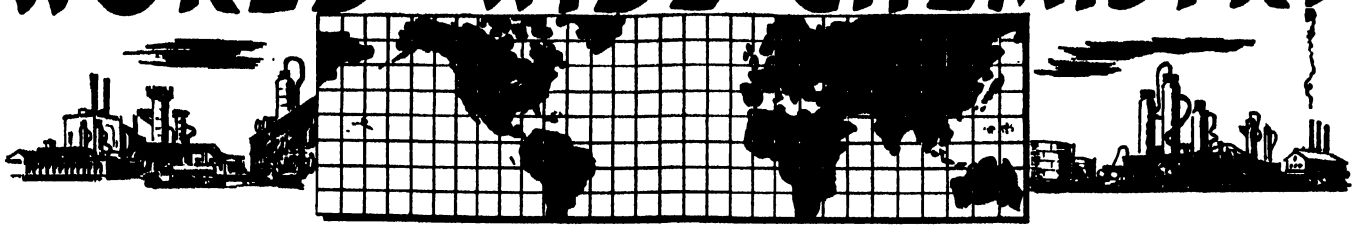
Potential Power Converted into Electricity

CONSUMPTION of unprecedented quantities of power in war production is placing new emphasis on methods of conserving energy. Before the United States entered the war, engineers of General Electric Co., Schenectady, N. Y. had developed two systems for utilizing potential power which would otherwise be wasted. These systems are pouring millions of kilowatt-hours back into war production.

Enormous power economies already have been effected by the airplane engine recovery method. During the 12 hours usually required to test an airplane engine, great quantities of high-octane gasoline are consumed. One airplane engine factory in the Middle West, for example, tests enough engines to produce kilowatt-hours numbering in the millions per month. This power is more than half the amount necessary to operate the entire plant at maximum capacity. By the G. E. method all of this recovered power is pumped into the plant's power system, and so successful has the method proved that 163 installations have been made, 72 of them by General Electric. Pratt & Whitney Aircraft, Ford, Buick, and Chrysler are among the manufacturers of airplane engines using the units.

General Electric experiments in salvaging this power go back to 1938, when Pratt & Whitney Aircraft requested that company engineers study possibilities of power recovery. The moment an airplane engine is completed it is placed on a testing stand and run at varying speeds for several hours, not only as a test, but to break in the engine. During the testing, the engine is ordinarily connected to a special propeller, and the entire engine output is dissipated in churning the air. The propeller serves merely as a load, a resistive force which the engine must drive. The quantities of high-octane gasoline consumed by today's engines of over 2,000 horsepower are enormous.

General Electric worked out a system whereby an alternating-current generator would replace the propeller as the load on the airplane engine. The power from the engine is stepped down to the relatively slow generator speed by a coupling device, with the result that a high percentage of the power is converted into electrical energy and pumped into the power system. Recently, however, a more flexible power recovery system eliminating the coupling device has been developed. This system incorporates the characteristics of the coupling and the constant-speed generator in one variable-speed unit.



Houdry Method for Producing Butadiene Perfected

IT HAS been reported that after seven months Eugene Houdry has perfected his catalytic cracking process for the commercial production of butadiene from oil. After working for seven years in France on the process, Houdry came to the United States and with the aid of the Sun Oil and Socony-Vacuum Oil companies spent over $10,000,000 in perfecting the process and developing apparatus for operating on a commercial scale.

Procurement Problems Discussed—Correction

CHEMICAL AND ENGINEERING NEWS wishes to correct an error in the news story, "Procurement Problems Discussed", in the June 25 issue. On page 812 the second sentence should read "Plant protection is provided by the Army, not the FBI, Captain Plank revealed, this responsibility having only recently been taken over from the federal bureau", not "Police protection" as originally published.

WORLD-WIDE CHEMISTRY

The turnover in British chemical markets remains at a highly satisfactory level, but new business has been on a somewhat reduced scale, as is usual at this time of the year. The few prices that changed during recent weeks were raised. Exports have dwindled and are limited to overseas countries which require British chemical products for their war effort. Cooperation between chemical manufacturers in Britain and other Allied countries, especially in the British Dominions, is facilitated by existing commercial and financial links. In the home market formaldehyde, barium chloride, and copperas were in brisk demand, as were most products for which English consumers rely on imports—potash compounds, oxalic and tartaric acids, chromium salts, etc. Solvents, in limited supply, are allocated among essential users. Distribution of overseas materials under Ministry of Supply and Ministry of Food direction occupies much of the chemical importers' time. Lend-Lease materials have become available from the United States and appear in the English market to a growing extent.

Government Cooperates with Experts in Chemical Controls

The policy of the British Government has been to use fully the assistance offered by chemical trade organizations in the execution of the controls, and the British Chemical and Dyestuffs Traders' Association reports that the measure of cooperation with government departments has been highly satisfactory. The association expects that many of the controls will operate for a considerable time after the war. In many cases circumstances have permitted a voluntary arrangement between producer and distributor in which provision was made for the allocation of supplies to essential industries on a ration basis.

The Board of Trade has set up an Advisory Committee of five members on the production and supply of toilet preparations under wartime conditions. The Ministry of Supply has appointed the Tin Research Institute as advisers on questions affecting the use of tin, and the institute will also collaborate freely with other government departments and with manufacturers. A Central Committee of Export Groups has been appointed by the president of the Board of Trade as a first step toward rehabilitation of the export trade after the war. It will advise the Board of Trade and the Export Council in matters affecting chemical export industries. It is composed of five members, and the perfumery, plastics, fine chemical, pharmaceutical, and general chemical trades have sent one representative each. A Synthetic Rubber Committee has been appointed by the Ministry of Supply to keep the situation under review. This decision may be regarded as a slight concession to those who advocate the establishment of a synthetic rubber industry in Great Britain, a suggestion which has been turned downed by the government. In the meantime it has been announced that steps have been taken for the production of substantial quantities of a rubber substitute.

Paint Industries Forced to Curtail Output, Close

While other chemical industries have been given "essential industries status", the paint trade will undergo a serious contraction as building operations have declined, restrictions are in force for repairs and renovations, and many paint materials are in short supply and must be conserved. Labor from paint factories has already been moved to more urgent war industries, and paint manufacturers will have to concentrate in the same way as other redundant producers of civilian goods. The production will be carried on in the most efficient plant, and other factories will have to close. Attention is being focused in the paint trade to indigenous materials. This applies equally to pigments, oil vehicles, and solvents. The manufacture of chrome colors has been limited to eight specified shades; this restriction will permit more efficient production methods. For concrete pigments, new specifications have been issued which permit the use of indigenous material of low coloring power. Utility grades of pottery must not be decorated with paints, and similar restrictions on unnecessary use of colors and dyes are in effect for other trades.

New Disinfectant for Hospital Use

A new disinfectant for use in hospitals is cetyl trimethyl ammonium bromide, a cationic detergent, used in 1 per cent solutions in warm water. It was found to reduce materially the number of bacteria on normal skin and to sterilize completely dirty and greasy bowls and baths. If used continuously, however, it seems to make the skin more sensitive to the action of certain chemicals.

Specifications Issued for Disinfectant Powders

British Standard Specifications have been issued for disinfectant powders. Hypochlorite powders consist of a whitish powder having an available chlorine content of not less than 30 per cent at the time of dispatch and, under satisfactory storage conditions, not less than 29 per cent 3 months later. If exported, the powder must have an available chlorine content of not less than 25 per cent 3 months after dispatch. In the case of other disinfectant powders, the germicidal efficiency determined by a modified Rideal-Walker technique must not be less than 0.5.

Uses of Producer Gas Receive Government Support

A Director of Producer Gas Vehicles has been appointed by the Minister of War Transport to encourage the use of producer gas plant for road vehicles. The government has prepared a plan for the manufacture of a first consignment of 10,000 generators for use with trucks and busses, and research institutes of coal and chemical producers have designed an alternative mobile gas producer plant to be used for 50,000 road vehicles. The solid fuels to be employed are soda-activated coke and anthracite, but research is still proceeding and may lead to the development of alternative fuels. Meanwhile experiments are under way with several mixtures of oils and coal deriva-

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

tives for normal bus engines, but consumption of these blends is insignificant as yet.

Two More Importers' Cooperatives Are Formed

The Lactic Casein Importers' Association and Association of Merchant-Distributors of Beeswax have been formed as companies limited by guarantee to cooperate with the Ministry of Supply or other authorities in the allocation and distribution in the United Kingdom of lactic casein, etc., and of beeswax and other agreed products. These companies, as others of the same type formed earlier, are cooperative associations of firms which have been engaged in import trades and now distribute the goods to English consumers in accordance with government instructions. This method of allocation of supplies has been most satisfactory from the point of view of economy, continuity, and efficiency. Supplies of lactic casein to be distributed are those received from the United States under Lend-Lease arrangements.

Economies Suggested in Use of Soft Solders

War emergency standards for soft solders have been issued, at the request of the Non-Ferrous Metal Control, by the British Standards Institution. Further economies are suggested. Use of solder may be omitted entirely as in automobile body patching, welding may be used to replace soldered joints, and varnish should be used where solder baths serve for protective coverings. Silver-lead solders are being developed for a variety of purposes, and lead solder with a very low tin content is recommended for high-temperature applications. Solder used for dipping baths should contain no more than 20 per cent of tin in place of 50 per cent now frequently adopted. Similar savings are suggested elsewhere by lowering the tin content of solder.

Naphthenic Oils Are Used for Insulated Cables

British practice in the selection of oil for cables insulated with impregnated paper was described to the Institution of Electrical Engineers by S. Peckinsale. Use of naphthenic oils is increasing rapidly because they are better solvents for rosin and oxidized bodies made from rosins than are paraffinic oils. Also oil and refined resin compounds have advantages over compounds containing unrefined gum rosins. All the oils and compounds can be prepared with excellent electrical properties, but the types used are those which reduce the chemical change in the presence of air to a minimum. For voltages up to 66 kilovolts, various oil and resin compounds are used, for higher voltages a thin naphthenic oil is employed for oil-filled cables, and a viscous naphthenic oil for pressure-type cables. Certain aromatic compounds are left in the oil to absorb any gas generated under electrical stress from the more saturated compounds in the oil. Solvent-refined naphthenic fractions have been found suitable for cables, but solvent-refined paraffinic fractions fail to absorb gas and make rosin compounds unstable.

New Essential Oil Resembles Citronella

A new essential oil, investigated by the Imperial Institute, is the oil from the leaves of *Leptospermum citratum*, a shrub or small tree of the Myrtaceae family which occurs in the wild state in New South Wales and Queensland, Australia, and was tried out in cultivation on a Kenya plantation. The oil has a strong lemonlike odor and contains 73.5 per cent by weight of aldehydes, consisting principally of citral and citronellal. It can be used in soaps or lotions of the eau de cologne type, but manufacturers do not believe that it has material advantages over Java citronella oil and Cochin lemongrass oil with which it would have to compete. Nevertheless it is believed by the grower in Kenya that, at least under conditions which existed in 1940, a plantation of trees with a high yield of oil can be worked even in competition with the quick-growing, lower yielding grasses in native hands in Eastern countries.

Hydrolyzed Glue Added to for Electroplating Baths

New addition agents have been tried for ammonium stannous oxalate baths used for electroplating. The best was found to be hydrolyzed glue prepared by boiling 10 grams of glue in 100 cc. of water for 10 hours. It equals peptone in efficiency, costs less, and is less subject to bacterial decomposition than peptone, according to a thesis of F. C. Mathers and P. H. Johnson to the Electrochemical Society. The tin deposits obtained with this addition agent were gray, smooth, adherent, and free from projecting crystals. No change was noticed when corncob glue, furfural, hydroquinone, alpha-naphthol, acetaldehyde, urea, tartaric acid, ammonium naphthalene sulfonate, ammonium benzene sulfonate, pyridine bases, cresol, or clove oil were added to the hydrolyzed glue. The best deposits were obtained from an ammonium stannous oxalate bath containing, in grams per liter, ammonium oxalate 60, stannous oxalate 50, oxalic acid 15, potassium iodide 50, hydrolyzed glue 1, and pyrogallol 1. Potassium sulfocyanate may be substituted for the iodide, but neither this nor the pyrogallol are necessary, although they somewhat improve the tin deposit.

G. ABRAHAMSON
150 HALFWAY ST.
SIDCUP, KENT
ENGLAND
June 18, 1942

Since the beginning of war the Brazilian Government has been studying possibilities for the establishment of new plants to produce goods previously imported. Concessions have already been granted for construction of plants to produce newsprint and aluminum and steel products. More recently the government granted a rebate of 50 per cent on duties on plants and equipment for a dry ice factory, the first of its kind in Brazil, and exempted the manufacture of window and plain glass from any federal, state, or municipal tax. The Export and Import Department of the Bank of Brazil has announced that priority preference will be given to Brazilian mining companies and cement factories for purchases of supplies, machinery, etc., essential for the expansion of present plants or the construction of new ones.

Exports of Minerals, Shipped Largely to U. S., Gain in 1941

Output of manganese ore has increased considerably in recent years, placing Brazil third among world producers of this mineral. In 1940 exports amounted to 222,391 metric tons and in 1941, 437,402 metric tons, of which 96 per cent were destined for the United States. However, this high export figure was lower than the 533,000 metric tons shipped in 1917.

Chromite is another mineral which may be exported in large quantities, provided transportation facilities are developed. Chromite exported in 1941 amounted to 4,424 metric tons. Although chrome found in Brazil is of an inferior quality compared with some other deposits throughout the world, it is estimated the country would be able to supply the United States with about 100,000 metric tons yearly if necessary. Reserves in the State of Baía amount to approximately 4,000,000 metric tons.

Exports of iron ores totaled 420,756 metric tons in 1941 against 255,548 tons in 1940. New installations are being built in Victoria, State of Espirito Santo, to permit the shipments of large quantities of iron minerals at more economical costs.

Exports of beryllium ore showed a remarkable progress in 1941, amounting to 1,703 metric tons against 1,472 in 1940 and only 276 metric tons in 1939.

Quartz exports also increased substantially in 1941 as compared with 1940. In

1941 exports totaled 1,980 metric tons of which 1,137 tons were acquired by the United States. In 1940 only 61 tons were shipped to the United States from a total exportation of 1,103 metric tons, the balance being taken by Japan with 447 tons, Great Britain with 522 tons, and other countries with smaller quantities.

Exports of tungsten ore in 1941 were almost five times those of 1937. During the past five years exports of tungsten ores were as follows: 1937, 6,681 kg.; 1938, 2,090 kg.; 1939, 7,900 kg.; 1940, 10,000 kg.; and 1941, 32,460 kg. Japan was the only purchaser of tungsten ores during 1941. Technicians representing American government agencies are visiting several Brazilian states where minerals essential for hemisphere defense are found.

Government Finances Plan for National Defense

The President of the Republic recently signed a decree providing for a special plan of financing public works and national defense equipment. The budget approved by the government estimates the expenditure of 600,000 contos de reis (approximately $30,000,000) during 1942. Notices from the several ministries indicate that a large amount of the budget will be used for exploitation of mineral resources, petroleum, coal, shale, vegetable oils and fats, aluminum and steel industries, rubber, and wood pulp and paper industries, as well as the improvement of present road, railroad, and other transportation facilities.

Plants Opened in Drive for Self-Industrialization

According to press notices several new factories have recently started to operate in the drive for self-industrialization. In the State of São Paulo, the leading producing center of Brazil, plants began to produce special steels, electric motors, bronze and other alloys for structural purposes, paper packages, and toys. In the State of Minas Geraes are new factories for the production of casein, motor car accessories, and portland cement. In the State of Ceará a plant is being built for the manufacture of plastics from the cashew nut, while a textile mill and vegetable oil refinery using coconut as raw material will soon be in operation.

Exportation of Rayon Forbidden Until Domestic Needs Are Filled

The National Economic Defense Committee, having carefully studied the present situation of rayon manufacture in Brazil, has approved the recent proposal made by the Junta Reguladora do Comercio de Fios e Tecidos forbidding the exportation of rayon until the internal market is supplied with the necessary requirements. Another decision issued by the government established ceiling prices for rayon yarns and canceled the previous decree regarding the importation of new machinery for rayon manufacture, which was suspended a few months ago when manufacturers informed the government that actual facilities are enough to supply the internal market.

Scientific Organizations of South America Plan Meetings

The Brazilian Chemical Society (Associação Química do Brasil) will meet in January 1943 in the city of Curitiba, State of Paraná. It will be the second annual meeting of the society, the first having been held in São Paulo. Curitiba means, in idiom, the land of pine trees, one of the most abundant native plants in the State of Paraná. Having a population of about 150,000 people, Curitiba is also known as the city of smiles. Its industrial activity is represented by 331 organizations producing goods in amounts that exceed 100,000 contos de reis per year. The largest number of factories, 30, is found in the furniture industry. However, the match industry tops off the production value. Toothbrushes, candles, metal blades, tanned leather, silk ribbons, leather and wooden goods, and pottery are products manufactured in Curitiba plants. The city is connected to the capitals of neighboring states by excellent railroads, highways, and air routes. The University of Paraná, where the scientific divisions of the Brazilian Chemical Society will meet, is situated in Curitiba. The society will also attend a meeting in Pernambuco at the beginning of next year for the discussion of problems affecting the sugar and alcohol industries.

The Asociación Quimica Argentina is planning to commemorate its 30th anniversary with a scientific meeting in September. The meeting will be sponsored by the asociación and South American countries are being invited to contribute. The Brazilian Standards Association (Associação Brasileira de Normas Técnicas) will hold its annual meeting in the city of Porto Alegre during October. Various committees will present for discussion and approval a large number of testing methods and standardized specifications. Brazilian technical terminology will also be discussed.

Patent and Trade-Mark Regulations Are Modified

The government, considering the situation created by the present war, recently signed a decree modifying the patent and trade-mark laws. The decree suspended, until after the end of the war, various legal periods within which annuities must be paid by inventors, registered trademarks, and patents used in Brazil, priorities guaranteed under conventions, as well as other measures confined to the internal routine work of the Patent Office. The new law also provides other changes in the processing of patents and trademarks in Brazil.

Brazilian Trade Shows Favorable Balance in Value

Despite the world situation, Brazilian foreign trade during the first three months of the current year showed a favorable balance in value exceeding that of the same period of 1941, although in 1942 export tonnage was inferior and import tonnage superior to those in the first three months of 1941. During January to March 1942 Brazil exported 740,449 metric tons of merchandise valued at 1,802,731 contos de reis (1 conto de reis equals about $50), against 794,637 metric tons valued at 1,356,540 contos de reis during the same period of 1941. Imports in the first three months of 1941 were 894,887 metric tons of goods valued at 1,147,529 contos de reis against 1,048,813 metric tons at 1,449,308 contos de reis during the corresponding period of 1942. Thus the favorable balance for the three-month period of 1942 amounts to approximately $17,671,100 against $10,450,550 during the same period of 1941, an increase of about 69 per cent for 1942.

Export Standards Set for Castor Bean, Bee's Honey

The government has approved specifications for the classification and control of exports of castor bean and bee's honey, with a view to their standardization. Exports of these two products have increased in the last months, mainly to the United States. Castor bean oil is being used in steady amounts for the manufacture of varnishes in place of tung oil, previously imported from China, and linseed oil. With the inclusion of castor bean and bee's honey in Brazilian standards regulations for export products, the principal materials exported by Brazil are now protected against complaints from foreign buyers not only in quality but also in uniformity.

Exports of Kapok in 1941 Show Decided Improvement

Exportation of Brazilian kapok, used largely in stuffing mattresses, pillows and cushions, in the manufacture of life preservers, in the insulation of cold chambers, heaters, music halls, airplane cabins, etc., as well as in the manufacture of linoleum,

has been very irregular in the past. However, exports in 1941 amounted to 314,056 kg. against only 66,689 kg. in 1940. Of the total for 1941, the United States took 112,529 kg., Great Britain 72,389 kg., and Argentina 47,832 kg. The remainder was taken by Switzerland, Sweden, and South American countries. The high price paid for this product during 1941 will probably stimulate production in Brazil, which will be able in the coming years to supply a substantial part of the United States requirements, estimated at about 14,000 metric tons a year.

Coal Production Gains but Fails to Fill Requirements

Production of coal in Brazil during 1941 reached the highest figure yet recorded with a total of 1,407,534 metric tons. Of this total 1,066,827 metric tons were produced in the State of Rio Grande do Sul. The output of the Brazilian coal mines during the past five years was as follows: 1936, 662,196 tons; 1937, 762,789; 1938, 907,224; 1939, 1,046,975; and 1940, 1,336,301 tons. In 1930 the total coal production amounted to only 385,148 metric tons. However, the coal produced in Brazil is not sufficient to meet local requirements, although imports decrease from year to year. Imports of coal in Brazil were 1,209,242 tons in 1940 and 1,057,946 in 1941. Brazilian coal is replacing foreign coal for the production of city gas and in all national and government railroad and steamer companies.

New Decrees Extend the Export Restrictions

The government has signed a decree forbidding the exportation of chemical and pharmaceutical products; surgical, optical, photographic, and electrical materials; agricultural machinery; and tools in general without special permission from the Export and Import Department of the Bank of Brazil. Permission will be granted only if local stocks are sufficient to meet national requirements for a long period or if its utilization in Brazil is unnecessary. In any case a special certificate must be obtained by exporters. The decree covers not only local manufactured products but also the products, materials, or machinery imported from other countries previous to the effective date of the law.

Another decree ruled that sales of motor cars and lorries are subject to control. Priority of purchase will be given to essential industries, especially those producing strategic materials for national defense. Exports of cars, assembled in Brazil from parts imported from other countries, are to be permitted to countries on the American Continent which do not possess assembly plants. However, exports of assembled cars are subjected also to the control of the same department of the Bank of Brazil.

Vegetable Oil Exports Show Steady Increases

Since the outbreak of war, exports of Brazilian vegetable oils have shown a steady increase. In 1939 Brazil exported 34,147 metric tons valued at 69,069 contos de reis, while in 1940 the total exportation amounted to 36,094 metric tons valued at 96,916 contos de reis. A further increase was voted in 1941 with 56,370 metric tons at 194,576 contos de reis. The breakdown of total exports in 1941 tonnage shows the following figures:

Export	Tons
Cottonseed oil	33,457
Oiticica oil	16,606
Castor oil	4,507
Ucuhuba tallow	1,055
Coconut oil	175
Murumurú fat	153
Copaiba oil	122
Andiroba oil	53
Babaçú oil	32
Cumarú oil	2

Sweden Regulates Prices, Distribution of Fertilizers

New regulations both as to allotments and prices govern the allocation of artificial fertilizers to Swedish agriculture in the current year, the U. S. Department of Commerce has been advised. In addition to a curtailment in several instances, to 80 or 85 per cent of consumption during the 1940-41 year, limitation of sodium nitrate from Chile, for instance, has resulted in allotment of this fertilizer only to sugar-beet growers. Each such grower who has signed a contract with the Swedish sugar manufacturing monopoly will be allowed to purchase 400 kg. of sodium nitrate from Chile for each 2.47 acres of sugar-beet area under contract.

Farbenindustrie "Purchases" Chemical Company in Poland

The "purchase" by the German I. G. Farbenindustrie A.-G. of the Boruta Chemical Industry Co. of Poland at Lods has been disclosed from abroad. The German "owners" plan to enlarge and modernize the factory, besides extending operations to include textile chemicals in addition to dyestuffs and by-products. The Germans have changed the name of the company to Teerfarbenwerke G. m.-B. H.

Production of Tung Oil in South Africa Promising

Tung oil promises to become a staple product of South Africa, following experiments and development work in that country for the past 20 years. There are now about 60,000 trees in the Union, from which a research station has recently estimated there can be obtained a yield of 581 pounds per acre, with 70 trees to the acre. Present high prices of the oil have led to many farmers becoming interested, and there are many plantings of 2,000 trees each, it is stated.

South Africa Experiments with Utilization of Tannery Wastes

Utilization of waste products from its tanneries and abattoirs which are available in quantity is under study in South Africa. Manufacture of glue, gelatin, and fleshing grease from hide trimmings and fleshings has been found not to require extensive facilities, can use unskilled labor and, coupled with the supply of materials available, is considered a good prospect.

Bolivian Quinine Bark Production Decreases

The fact that quinine bark is obtained from wild trees is blamed for a sharp drop in output from Bolivia during 1941, when the total crop was estimated at less than 600 tons, compared with 724 tons shipped in 1940. Only a few attempts have been made to cultivate the trees from which bark is stripped, and the amount of bark from this source will probably be small for years; hence each year the natives who gather bark from wild trees have to go farther inland.

Shipments for the first nine months of 1941 were reported at only 341 tons. Most of 1940's exports went to Japan.

Woody Remnants from Flax Used in England

A new use for woody remnants from flax treated to make linen has been reported from England. This woody remnant left after flax shives have been treated to make linen was formerly wasted or burned. Now this material is ground to 80 mesh (B. S. S. screen) and used as filler for phenolic Bakelite molding powders, flexible boards, rubber products, linoleum, and other manufactures, for which it has proved a cheap product. Ground to 30 mesh the substance is used to clean tin plate.

Soap and related products, under license for importation by the Swedish Government, may be somewhat curtailed in use by such license order. The licensing order covers soaps, soap substitutes, soft soap, and allied products containing fat, oil, or soap.

Wheelco

UNIVERSAL

Temperature Controllers

can give you:

1. "Electronic Principle" Control, *plus*
2. Extreme accuracy of temperature measurement, *plus*
3. Interchangeability of all component parts, *plus*
4. Interchangeability of scale ranges, *plus*
5. Ready accessibility of all parts for individual checking, *plus*
6. Setting devices which may be mounted and locked within the instrument case as a precaution against sabotage.

Wheelco UNIVERSAL Controllers include Capacitrols, Potentio-trols, Limitrols and Resistance Therm-otrols.

Wheelco UNIVERSAL Controllers have unlimited applications for indicating, measuring and controlling temperatures. For complete information on these instruments write for free bulletin.

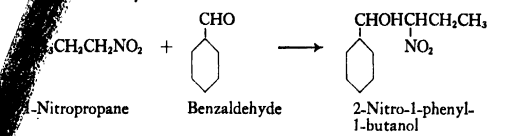
Nitroparaffin Syntheses

Chemists who have already experimented with them tell us there are no more intriguing materials for research today than the Nitroparaffins. Perhaps it is not only because they are entirely new chemical products . . . but also because they are so highly reactive. Each new reaction opens new vistas of interesting research . . . with the ever-present possibility that new materials or processes of great value may be uncovered.

these reactions should suggest many others...

Nitro Alcohols* are made by condensing an aldehyde with a Nitroparaffin:

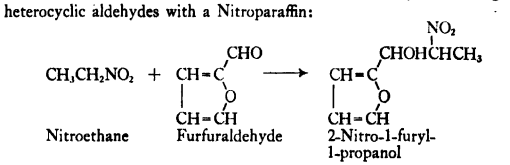
$$CH_3CH_2CH_2NO_2 + C_3H_7CHO \longrightarrow CH_3CH_2\underset{\displaystyle NO_2}{\overset{|}{C}}HCHOHC_3H_7$$



1-Nitropropane — Butyraldehyde — 3-Nitro-4-heptanol

Chlorinated Nitroparaffins are obtained when the NP's are treated with chlorine in aqueous, alkaline solutions:

$$CH_3CH_2NO_2 + 2Cl_2 + 2NaOH \longrightarrow CH_3\underset{\displaystyle Cl}{\overset{|}{C}}NO_2 + 2NaCl + 2H_2O$$



Nitroethane — 1, 1-Dichloro-1-nitroethane

Aromatic Nitrohydroxy* derivatives can be produced by condensing an aromatic aldehyde with an NP:

1-Nitropropane — Benzaldehyde — 2-Nitro-1-phenyl-1-butanol

Heterocyclic Nitrohydroxy* derivatives are made by condensing heterocyclic aldehydes with a Nitroparaffin:

Nitroethane — Furfuraldehyde — 2-Nitro-1-furyl-1-propanol

**The corresponding amine can usually be made by hydrogenating the nitro compound.*

Today, when the future of America lies in our capacity to produce, chemists can make no greater contribution than to find new production short-cuts and new or improved materials that will relieve critical shortages.

We will gladly furnish samples for laboratory experiment and work with you on problems involving the nitroparaffins.

●

During the past six months, 7,716 chemists have expressed their interest in these compounds by asking for this 40-page Data Book, "The Nitroparaffins—New Worlds for Chemical Exploration." We will gladly send you a copy, too, on request.

PLAN FOR TOMORROW * INVESTIGATE

American Chemical Society[1]

104TH MEETING. Buffalo, N. Y., September 7 to 11, 1942.

105TH MEETING. Indianapolis, Ind., April 12 to 16, 1943.

106TH MEETING. Minneapolis, Minn., fall of 1943.

NATIONAL CHEMICAL EXPOSITION AND NATIONAL INDUSTRIAL CHEMICAL CONFERENCE. Sherman Hotel, Chicago, Ill., November 24 to 29, 1942.

Other Scientific Societies

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS. Netherland Plaza Hotel, Cincinnati, Ohio, November 16 to 18. Annual meeting.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Vancouver, B. C., September 9 to 11.

AMERICAN OIL CHEMISTS' SOCIETY. Drake Hotel, Chicago, Ill., October 7 to 9.

AMERICAN PETROLEUM INSTITUTE. Stevens Hotel, Chicago, Ill., November 9 to 13. Annual meeting.

NATIONAL LUBRICATING GREASE INSTITUTE. New Orleans, La., October 26 to 28.

NATIONAL PETROLEUM ASSOCIATION. Hotel Traymore, Atlantic City, N. J., September 16 to 18. Annual meeting.

NEW ENGLAND ASSOCIATION OF CHEMISTRY TEACHERS. University of New Hampshire, Durham, N. H., August 11 to 14.

TECHNICAL ASSOCIATION OF THE PULP AND PAPER INDUSTRY. Hotel Statler, Boston, Mass., September 29 to October 1.

[1] The list of the SOCIETY'S National Officers and Directors, Editors, members of Council, Divisional and Local Section Officers, Committees, and Chapters of Student Affiliates appears in CHEMICAL AND ENGINEERING NEWS three times a year—usually February 10, May 10, and October 10. The latest list is printed on page 601 of the May 10 issue.

The Nineteenth Colloid Symposium

Boulder, Colo., June 18 to 20, 1942

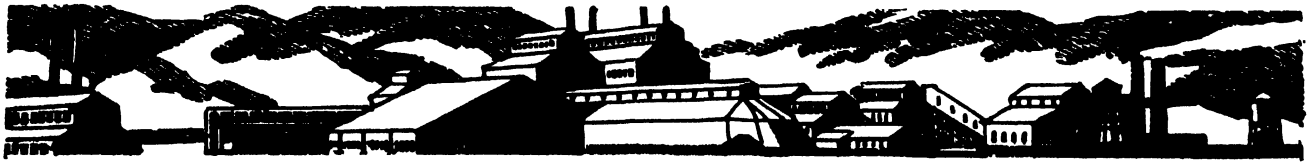
IN SPITE of travel problems, more than 100 guests registered for the Nineteenth Colloid Symposium, held on the campus of the University of Colorado, June 18 to 20, 1942. With but a single exception at least one author of every communication was on hand to present his paper.

The symposium was opened Thursday morning by Professor Germann of the Department of Chemistry, University of Colorado. Dr. Beniams of Colorado spoke on a two-path rectilinear electrophoresis cell and Dr. Marton of Stanford surveyed the applications of the electron microscope in colloid chemistry.

The Thursday afternoon session was opened with an inspiring address by President Robert L. Stearns of the University of Colorado, who made a special trip from a business engagement in Denver to welcome the guests of the symposium. The five papers of the afternoon on the general subject "Inorganic Colloid Chemistry" were presented by Shaw and France of Ohio State, Weiser of Rice, Reyerson of Minnesota, and James of Eastman Kodak Co.

The Friday morning session was devoted to five papers under the general subject "Colloidal Electrolytes" given by Marshall of Missouri, McBain and Mrs. McBain of Stanford, Dean of Stanford, and Cassell, consulting chemist, Chicago. The Friday afternoon and Saturday morning sessions were given over to various aspects of "Protein Chemistry". The six papers were presented by Hauser of the Massachusetts Institute of Technology, Norris of Colorado, Hill of the University of Colorado School of Medicine, Abramson of Columbia, Strain of the Carnegie Institution of Washington, and Friedman of Oregon State College. The authors who presented the 18 papers and their associates who collaborated with them in the preparation of the papers are to be congratulated on the quality of the contributions which maintained the interest of the group throughout the five sessions. Through the kind cooperation of Dr. Lind, the papers will be published during the fall in the *Journal of Physical Chemistry*.

The Committee on General Arrangements, with Professor Germann as Chairman, and the Committee on Entertainment for Women, with Mrs. Germann as Chairman, provided for the comfort and entertainment of the guests. On Thursday afternoon the visiting ladies were complimented by a tea at the Germann home and on Friday afternoon were taken to points of interest in the vicinity of Boulder. Thursday evening all the guests were entertained at dinner in the Boulderado Hotel, followed by a musical program, in the Music Room of the university library, contributed by Professors Jones and Wessel of the College of Music of the university. On Friday evening the guests were motored to the picnic grounds atop Flagstaff Mountain for a steak fry. At twilight the group returned to the campus of the university where they were entertained at a square dance.



Program of papers, entertainment, and fine weather combined to make the Nineteenth Colloid Symposium a memorable one for all who were fortunate enough to attend.

HARRY B. WEISER, *Chairman*

Alpha Chi Sigma Holds Conclave

HIGHLIGHTS of the 17th biennial conclave of Alpha Chi Sigma, professional chemical fraternity, at the Congress Hotel, Chicago, Ill., June 19 to 22, 1942, were addresses by past presidents William Higburg, sales manager of the Republic Creosote Co., Indianapolis, and H. E. Wiedemann, consulting chemist of St. Louis. The convention was also addressed by member S. D. Kirkpatrick, president of the American Institute of Chemical Engineers and editor of *Chemical and Metallurgical Engineering*. Carl S. Miner, of the Miner Laboratories, was initiated by the fraternity into its Illinois Institute of Technology chapter. The collegiate chapters at the institute and at Northwestern University joined in conducting the ceremony. Although the conclave had been shortened and entertainment features eliminated, all official delegates were present save alumni representatives from Los Angeles, San Francisco, and Philadelphia.

The fraternity will continue to lend its financial sponsoring ($1,000 per year) to the AMERICAN CHEMICAL SOCIETY Award in Pure Chemistry. It will also continue its national grants-in-aid activities whereby money grants are made to collegiate chapters in sponsoring local professional activities of benefit to the chemistry department and the school. The national

safety program, set in operation during the past biennium, will be continued. The fraternity adopted legislation to meet, as best possible, the three-semester plan in some schools. The national office reported a high active membership and a record number of men initiated during 1940–41. A national committee was established to direct the operation of the fraternity in the best interests of national defense.

Walter S. Ritchie retired as president and completed 20 years of active service with the fraternity in national capacities. He was succeeded by Harold P. Gaw, American Rolling Mill Co., Middletown, Ohio. Other members of the executive council elected were: first vice president in charge of professional chapters and groups, A. Watson Chapman, Celotex Corp. of New Orleans; second vice president in charge of collegiate chapters, L. W. Van Doren, Basic Vegetable Products Co., Vacaville, Calif.; national ritualist, Clyde B. Hutchison, Champion Coated Paper Co., Saundersville, Ga. John R. Kuebler (Epsilon), Indianapolis, was appointed national secretary-treasurer and editor of *The Hexagon*, and with this conclave assumed these duties for the fraternity on a full-time basis.

Invitations for subsequent conclaves were submitted: 1944, St. Louis, Mo., and 1946, Cleveland, Ohio, under the sponsorship of the Cleveland–Akron–Case School of Applied Science groups.

Westinghouse Shares Its "Know How"

More than a score of new engineering developments and new ideas that could be put to work to help speed production in almost any war industry were disclosed at the Astor Hotel, New York, to newspaper writers and leading technical magazine editors by the Westinghouse Electric and Manufacturing Co. on June 16.

"We believe this demonstration illustrates the willingness of many big companies to share their specialized 'know how' with all American industry during this national emergency", said A. A. Bates, who directs chemical and metallurgical work at the Westinghouse Research Laboratories, where many of the technical advances were discovered. "The real problem", he continued, "is to provide some means for the common interchange among industries of such ingenious discoveries and new techniques, so they can be put to use in the thousands of small factories which are working day and night on war production."

Devices demonstrated ranged from a simple screwdriverlike cotter pin spreader that any factory worker can use to one requiring elaborate laboratory equipment and skilled technicians for determining by photoelasticity the stresses on huge bolts in turbines. With photoelastic analysis, M. Hetenyi of Westinghouse discovered that a nut with either a tapered thread or tapered lip will increase the effective strength of the fastening as much as 40 per cent, reported Dr. Bates.

Westinghouse electronics research has reduced from 8 hours to 15 minutes the time usually required to determine the grain sizes of metallic powders used by numerous industries in making pressed, molded metal parts. To grade speedily these tiny metal specks—so small they can be seen only with a powerful microscope—P. F. Kalischer, Westinghouse research metallurgist, developed a sorting method that employs a glass tube, a photocell, a light bulb, and a milliammeter. To analyze a powder specimen, Dr. Kalischer mixes 1 gram of the specimen with 100 cc. of acetone and a wetting agent. The mixture is placed in the glass tube mounted between the photocell and the light source. As the particles settle, the liquid clears, permitting more light to pass through the tube to the photocell.

"By reading the milliammeter at regular intervals, Dr. Kalischer plots a curve showing the rate at which the specimen clears", Dr. Bates said. "Comparing this curve with similar curves for standard particles of known size, he can determine both average size and relative quantities of different particles in the test specimen. The usual method of measuring particle size is to float the powder in glycerol and measure the settling time, but such a test does not give accurate information about relative quantities of grains of different sizes. Use of a wetting agent is important, because it helps the acetone to surround each metal grain completely. Without it, the settling rate might be affected by tiny air bubbles surrounding the grains."

Others among 25 examples of Westinghouse "know how" demonstrated or explained by Dr. Bates included the use of electric heaters to tighten big turbine bolts, a technique that avoids torsional strains; use of magnetism to detect under-the-surface flaws in steel; an electronic control to increase production and safeguard the quality of steels treated in atmosphere furnaces; and development of machine-made dies to replace many handmade dies.

Armour Foundation Plans War Policies

To provide for thorough consideration of problems facing the Armour Research Foundation, Chicago, free from pressure of everyday matters, Harold Vagtborg, director, called a week's conference of department heads at a remote point in Wisconsin from June 22 to 27. Among problems discussed at a round table were how the foundation staff of 125 can more effectively serve the war effort and aid industry in preparing for the post-war period, and what new approaches can be made to the major war projects already being studied by the foundation.

Mineral Industries Conference Canceled

The Illinois Mineral Industries Conference, scheduled for Urbana, Ill., October 30 and 31, has been canceled, according to an announcement by M. M. Leighton, chief of the Illinois State Geological Survey. The sponsoring groups, the Illinois Mineral Industries Committee, Engineering Experiment Station of the University of Illinois, and State Geological Survey, have agreed to lend their combined support to the Regional Conference of the American Institute of Mining and Metallurgical Engineers in St. Louis October 1 and 2. The St. Louis meeting will stress problems of the mineral industries of the Mississippi Valley area, with particular reference to war needs, and the purpose of the Illinois conference, as originally planned, will be adequately met.

Science Talent Search Trips

Nine girls and 31 boys were invited to Washington, D. C., July 13 to 15 to compete for 20 Westinghouse science scholarships in the Science Talent Search conducted by the Science Clubs of America and sponsored by Science Service. Winners of the trip were selected by competition in secondary schools of the United States, from more than 10,000 entrants. Twenty will be chosen for scholarships which will allow them to go to any college of their own selection to continue science or engineering training. One boy and one girl will be awarded $2,400 Westinghouse Grand Science Scholarships, while 15 boys and 3 girls will receive $200 Westinghouse Science Scholarships.

Instruments Needed

Research workers seeking instruments required in their work but difficult to find are invited to communicate with D. H. Killeffer, 60 East 42nd St., New York, N. Y., chairman of the newly appointed Committee on the Location of New and Rare Instruments of the National Research Council. The plan of the committee's activity is to assist in locating needed instruments of types not ordinarily available through usual channels.

Assistance is particularly desired from owners and builders of instruments falling within the new or rare categories which might be made available to others through sale or for temporary use under mutually satisfactory conditions.

Introduction to Heat Transfer. *Aubrey I. Brown* and *Salvatore M. Marco.* 1st ed., 232 pages. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1942. Price, $2.50.

This book is well titled and is written especially for the mechanical engineering student. It is the most complete elementary textbook on the subject and it is the first text outside the chemical engineering field written with this scope. The treatment of the subject matter is not involved and a knowledge of algebra, elementary calculus, and physics will suffice for background information. The book is up to date, well organized, and the more complicated empirical relations are but briefly discussed. Many references are made to the more detailed and advanced literature. Illustrated problems are numerous and well worked out, and at the end of each chapter there are many problems. This helps to make the text very teachable.

The book is not long and most chapters are quite short, but the fundamental material is adequately presented. The subjects covered are best illustrated by the following chapter headings: Modes of Heat Transfer, Heat Transfer by Conduction, Equations for the Calculation of Heat Transfer by Conduction (Steady State), Radiation, Introduction to the Study of Convection, Forced Convection, Free or Natural Convection, Heat Transfer to Boiling Liquids, Condensing Vapors, Over-all Transfer of Heat, Application of the Principles of Heat Transfer to Design Problems, and Variable Heat Flow. Preceding Chapter I several pages are given over to a discussion and table of nomenclature. The symbols used are standard, but it is unfortunate that the symbol θ is used for temperature difference as well as the more common Δt; both are used in the text.

Radiation, Forced Convection, and Variable Heat Flow are well treated. It should be noted that the illustrations, problems, and references cover many engineering processes. References and problems involving different aspects of heat transfer in air conditioning are especially good and have not heretofore been so completely integrated with the general theory. The chapter on Applications of the Principles of Heat Transfer to Design Problems is excellent, and although short it is a well-rounded illustrated summary of heat transmission.

J. H. Rushton

Analytical Chemistry, Volume II, Quantitative Analysis. Based on the German text of *F. P. Treadwell,* enlarged and revised by *William T. Hall.* 9th English ed. 806 pages. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1942. Price, $6.00.

For the past 40 years the names Treadwell and Hall have been familiar to every student of chemistry in America. What the average student perhaps has not realized is that Frederick Pearson Treadwell was an American, born at Portsmouth, N. H., on February 5, 1857.

As was the custom many years ago, Treadwell, like other Americans, sought technical education in Europe. A student at Göttingen and Heidelberg from 1875 to 1878, he obtained the degree of doctor of philosophy from the latter institution, and, for the next three years, became an assistant to Bunsen.

Treadwell finally selected Zürich, Switzerland, as the garden spot in which to live. There he settled, married, and, from 1894 until his death on June 24, 1918, taught analytical chemistry at the Eidgenössische Technische Hochschule, a position to which his son, William D. Treadwell, succeeded in 1919.

In 1904 a young instructor at the Massachusetts Institute of Technology, William Thomas Hall, likewise a New Englander, translated the elder Treadwell's "Kurzes Lehrbuch der analytischen Chemie" into English. After the first English edition the book was revised from time to time without paying attention to the new editions of the German text. Thus, the succeeding English editions became more the work of Hall and less that of Treadwell.

As known to the student, "Treadwell-Hall" consists of two volumes; one devoted to qualitative analysis, the other to quantitative. Primarily intended for student use, these texts are found as reference books in practically every chemical laboratory. In this ninth edition the methods of gravimetric analysis have been rearranged to correspond to the order in which the elements are detected in the usual scheme of qualitative analysis. Descriptions of quantitative methods have been brought up to date as nearly as possible; for instance, in the discussion of the platinum metals, the procedure recently developed at the National Bureau of Standards for their separation and determination has been included.

An attempt to give a detailed account of the latest edition to the many who are familiar with the earlier editions would scarcely be justified. Suffice it to say that Professor Hall has done an excellent piece of work. This new volume on quantitative analysis deserves a place on the reference shelf, within easy reach of the analytical chemist.

Raleigh Gilchrist

Introduction to the Microtechnique of Inorganic Analysis. *A. A. Benedetti-Pichler.* 1st ed. vii + 302 pages. John Wiley & Sons, 440 Fourth Ave., New York, N. Y., 1942. $3.50.

This volume replaces the "Introduction to the Microtechnique of Inorganic Qualitative Analysis" by Benedetti-Pichler and Spikes. Numerous details for preparation and manipulation of accessory apparatus for handling small amounts of material are given in the introductory portion and in connection with the various analytical procedures, which are meticulously described in the form of experiments for student use. Some 125 pages are devoted to exercises illustrating the microtechniques of qualitative analysis, including typical spot and bend tests, and the more widely used microscopical precipitation tests, with emphasis on the ions of the copper and arsenic groups. At some length the author discusses methods of handling unknowns containing several ions and working up group precipitates so that specific confirmatory tests can be applied. It is shown that the typical sequences of manipulation and separation common in microqualitative analysis of the above groups can be successfully carried out on a milligram or centigram scale.

The remainder of the book is about equally divided between gravimetric and titrimetric inorganic qualitative analysis. The use of the microbalance, filter stick technique, electrodeposition, and microburet and -pipet are discussed, and directions are given for gravimetric determinations of Na in $Na_2C_2O_4$, H_2O in $CaSO_4 \cdot 2H_2O$, Al_2O_3 in alum, CaO in $CaCO_3$, MgO in $MgSO_4$, CaO, MgO, and SiO_2 in limestone, and Cu and Ni in German silver; titrations of acids and bases, Cu with thiosulfate, and Ag with cyanide are also described. It is to be hoped that in future editions the scope of this portion of the book may be greatly expanded beyond these type experiments, and that the present work may encourage the study and

CONTINUED ON PAGE 926

Buoyant Type Glass Developed

A NEW type of opaque glass that floats like cork and can be used as the buoyant element in the construction of life boats, life rafts, life preservers, and pontoon bridge supports has been developed by the Pittsburgh Corning Corp., Pittsburgh, Penna. The product, called Foamglas, is under active investigation by certain government agencies as an alternate material for such critical products as cork, balsa wood, cellular rubber, and kapok, which are largely imported. Last year under a certificate of necessity a large factory was built in western Pennsylvania and production already has started.

Pittsburgh Corning Corp. has had this product under development since 1938. The Armstrong Cork Co. is immediately marketing the material in the low-temperature insulation field, where it can be used for cold rooms in meat-packing plants, breweries, dairies, and ice cream plants.

Foamglas weighs only 10 pounds per cubic foot—one fifteenth of ordinary glass—and is odorless, fireproof, and verminproof. It is extremely light in weight, opaque, rigid, and has a cellular structure containing myriad tiny airtight cells which give it buoyancy and valuable insulating properties. The product can be sawed or drilled with ordinary tools. It is available in slabs 12 inches by 18 inches and in thicknesses of 2, 3, 4.5, and 6 inches. Its introduction marks the first time in the history of glassmaking that a "foaming" process has been used in the industry.

Left. Foamglas insulation weighs only one fifteenth as much as does ordinary glass. *Below.* Foamglas can be sawed and worked with ordinary tools. Here a workman saws a block of the new product in a mitre box.

Control of Additional Companies Taken Over

CONTROL of General Dyestuff Corp., Byk, Inc., and Siemens, Inc., all of New York, and Ajax Transportation Co., Nashville, Tenn., has been taken over by the Alien Property Custodian.

General Dyestuff Corp. has been the selling agency for General Aniline and Film Corp. Control of the latter company was vested by the Alien Property Custodian several weeks ago. With assets of $6,000,000, General Dyestuff's 1941 sales exceeded $22,000,000. Byk, Inc., is a subsidiary of a large German pharmaceutical company and manufactures chemicals and drugs in the United States under patents and trade-marks acquired from the parent company. Siemens, Inc., was the United States representative of Siemens and Halske, A.-G., of Germany, one of the largest electrical and radio equipment manufacturers in the world. Siemens also owns a number of patents which it holds by assignment from its parent company and which now come under control of the custodian. Ajax Transportation Co., heretofore owned by Fritz von Opel, is engaged in the transportation of gasoline by tank car.

Quality of Civilian Dyes Remains High

LIMITATIONS in the amount of chemicals available need not result in poorly dyed fabrics, the Office of Price Administration has reassured the interested trades. While a scarcity is admitted in such strategic materials as toluene, naphthalene, aniline, and phenol, this agency continued, the amount of these chemicals required is not less for poorer quality dyes than for fast dyes. Production of good quality fast dyes is essential to the war conservation program, it was emphasized, as from a conservation standpoint it is much better to make high quality fast dyes out of the available basic organic chemicals. Great waste results from use of low quality dyes because they run or fade, shortening the useful life of the garment.

The dye industry, it was reported, has the capacity to meet both military and essential civilian demands without sacrificing the quality of its products. Sufficient preshrinking equipment exists to provide for all essential civilian requirements. The textile conservation program will mean changed types of fabrics for civilian use and fewer nonessential clothes, but dye production, it is believed, can keep up with clothing production in any event.

A. H. Brunner, Jr., has resigned as chairman of the Binghamton Section of the AMERICAN CHEMICAL SOCIETY and is on military furlough from his position as research chemist with the Agfa Ansco Division, General Aniline & Film Corp. At present he is on active duty with the Chemical Warfare Service, Edgewood Arsenal, Md.

War Department Studies Indictment of Chemical Firms

THE possibility that prosecution of some 21 chemical companies and 65 of their officials, indicted for alleged violation of the antitrust laws in production of acids, may be postponed for the duration is indicated by the fact that the War Department is studying the possible effect upon war production of the government proceeding at this time. There was no advance information obtainable on the probable attitude the department would take but it was believed that, if its studies showed that trial of the cases would interfere with production of war materials by the companies, it would request Attorney General Biddle to postpone further action for the duration.

There are several precedents for such action, the latest being in the case of the antitrust action of the Department of Justice against Allied Chemical & Dye Corp. and seven other dyestuffs producers. There is a general understanding between the Department of Justice and the War Department that, if the latter regards any action against a firm under the antitrust laws as likely to delay production of war materials, further proceedings under the indictments are to be held in abeyance. A number of the firms indicted are engaged to a very large extent in producing chemicals for the war program.

John M. Lupton, formerly advertising manager of the Robins Conveying Belt Co., Passaic, N. J., has been appointed advertising manager of the Acheson Colloids Corp., Port Huron, Mich.

long-needed application of quantitative microanalysis in inorganic fields, as did Pregl's pioneer work in organic microanalysis.

C. W. MASON

Soils and Fertilizers. *Firman E. Bear.* 3rd ed. 374 pages, 58 figures, 165 tables. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1942. Price, $3.50.

THIS is a third edition of the author's well-known "Soil Management". Because of the increasing importance of lime and fertilizers as aids in the maintenance of the productivity of soils the change in title was made. The book is intended primarily for use in the first course in soils in agricultural colleges. It will also be useful to persons, other than college students, who may be interested in obtaining an elementary discussion of the principles of soils and fertilizers.

The illustrations and tables are well chosen and presented clearly and concisely. A list of pertinent references is given at the end of each chapter. The volume is well written and is an excellent presentation of the elements of soils and fertilizers.

H. R. KRAYBILL

Handbook of Scientific & Technical Societies and Institutions of the United States and Canada. Bulletin No. 106. *Callie Hull* and *Mildred Paddock* (U. S. Section), *S. J. Cook* and *P. A. Howard* (Canadian Section). 4th ed. 389 pages. National Research Council, National Academy of Sciences, Washington, D. C., January, 1942. Price, $4.00.

Volumetric Analysis, Volume I. *I. M. Kolthoff* and *V. A. Stenger.* xv + 309 pages. Interscience Publishers, Inc., 215 Fourth Ave., New York, N. Y., 1942. Price, $4.50.

THE present volume represents a revision of the American edition of this well-known text which appeared in 1928. Although the general character of the book, that of theoretical treatment, remains unchanged, it has undergone a thorough revision and considerable new material has been added. The chapter on Stability of Solutions has been transferred to the forthcoming revision of Volume II. The section on oxidation-reduction indicators has been greatly enlarged and improved, and contains a selected list of indicators with oxidation potentials covering the range of 0.24 to 1.30 volts. The treatment of reaction velocity has been amplified by the inclusion of chain reaction mechanisms. An important addition to the chapter on Adsorption and Coprecipitation Phenomena comprises a detailed consideration of errors caused by mixed crystal formation. The chapters on Volumetric Methods of Organic Analysis and Methods for the Determination of the Equivalence Point have been revised with new data. The latter chapter now contains a discussion of amperometric (polarimetric) titrations. The present edition has been improved in appearance and continuity by the use of smaller type for certain paragraphs dealing with more detailed data and discussion. In its revised form this text should enjoy increased use and reputation.

W. W. RUSSELL

Du Pont—One Hundred and Forty Years. *William S. Dutton.* 396 pages. Charles Scribner's Sons, New York, N. Y., 1942. Price, $3.00.

THIS", says the foreword, "is a story of men and goods, of peace and war, of vision and venture." It is also the story of the growth of a great country and of traditions which are threatened in today's war.

As a saga of the du Pont family, starting in France years before Eleuthère Irenée du Pont de Nemours, refugee from a French dictatorship, established a gunpowder factory near Wilmington, Del., in 1802, the book is an engrossing novel.

As a biography of business in America, it is an answer to critics of capitalism and free enterprise. The development of du Pont, in itself an American tradition, points the corresponding expansion of business in the United States from pioneering single factories to well-backed organizations offering limitless opportunities for new blood and new ideas.

As a history of industrial development "Du Pont—One Hundred and Forty Years" is a convincing defense of research and venture. The book is more than a history of one organization; it is a timely description of the "American way of life".

June Journal of Physical Chemistry

THE *Journal of Physical Chemistry* for June contains the following papers, as well as reviews of new books:

RALPH W. LAWRENCE AND JAMES H. WALTON. Effect of Inhibitors on Rate of Oxidation of Copper by Oxygen in Phosphoric Acid Solutions.

I. M. KOLTHOFF AND F. T. EGGERTSEN. Studies on Aging and Coprecipitation. XXXVI. Mixed-Crystal Formation of Lead Molybdate with Colloidal and Flocculated Lead Chromate.

New

POLY-PALE

Harder, Higher-Melting, yet Retains Substantially the Full Acidity of Rosin

HERCULES Poly-Pale Resin should improve the quality of products designed for glossy, hard finishes, for adhesives, stiffeners, driers, polishes, and other products in which rosin is normally used.

This new Resin has a high viscosity, high melting point, and low oxygen absorption. It resists crystallization in solution, and in metal resinates shows a high content of metal for improved drying action.

Poly-Pale Resin may well answer some of your problems caused by the shortcomings of rosin, or by scarcity of other types of resins, shellac and similar materials.

We will be glad to send you information in detail, or to ship a sample for your own experimental purposes.

PROPERTIES

Melting Point (drop)	98-103°C. (208-217°F.)
Melting Point (ring and ball)	92-94°C. (198-201°F.)
Acid No.	152-156
Saponification No.	157-160
Color (U. S. Standard)	WG-X
Refractive Index at 20°C.	1.5440
Specific Rotation (solid)	+ 40°
Petroleum Ether Insoluble	7
Ash	0.01%
Viscosity—60 percent in toluene (CTS)	20
Density (at $\frac{25°C.}{25°C.}$ against water)	1.0740

Refractive Index Bulletin

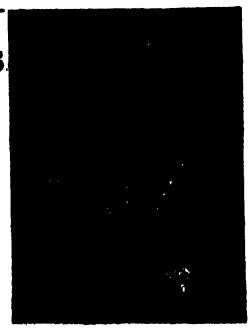
A SPECIAL bulletin on the determination of the refractive index of transparent and translucent solids has been issued by R. P. Cargille, 118 Liberty St., New York, N. Y. The publication covers the general principles, a review of the materials to which microscopical determination of refractive index can be applied, three methods of judging the relative index of the specimen, the Emmons double variation method, and other sections pertaining to this technique. Occasion for the publication is the announcement for sale of Shillaber's certified index of refraction liquids, a set of 91 certified liquids for use in determining the refractive index of solids. The refraction range from 1.460 to 1.640 is covered by these liquids which increase in range by intervals of 0.002.

Series of Books on Science Proposed

L. B. FISCHER PUBLISHING CORP., 381 Fourth Ave., New York, N. Y., announces a new series of pocket-size books entitled "The Treasury of Science" and priced at $1.25, designed to serve the student and intelligent reader by dealing authoritatively with varied aspects of modern scientific knowledge. The selection of subjects and authors, as well as the approval of the texts, by a board of editors, which now includes Alvin Johnson, director of the New School for Social Research, Harlow Shapley of Harvard University, and Alfred E. Cohn of Rockefeller Institute, promise to establish this series as a major contribution to the educational forces in American life.

The books are not to be texts or to contain a great array of footnotes or references. They will be written by authoritative scholars, abreast of the level of knowledge, and will include as much of the history of the subjects as to make their contemporary position understandable.

Each of the books is to consist of some 200 pages of clear, readable type with adequate illustrations. The size of the books will be uniform, 4.25 × 6.75 inches.



Our readers are invited to communicate with the L. B. Fischer Publishing Corp. with regard to manuscripts which might be suitable for publication in this series.

Merck Report Commended

THE Patriotic Service Cross of the United States Flag Association has been awarded to *The Merck Report* for the best flag cover design among house magazines. The winning cover on the July issue showed an original painting of the flag in full color against a photographic background which included symbols of science and industry. *The Merck Report*, which was established in 1891, is published in the interests of pharmacy and medicine and is edited by Douglas Wakefield

3 CHLORINATED ORGANIC CHEMICALS *developed by* PENN SALT RESEARCH

Hand in hand with manufacturing, Penn Salt carries on unremitting research... seeking new compounds, improvements in present products and better production methods.

Now from our Research Laboratories come three chlorinated organic chemicals with interesting properties and possibilities. One or more of them may aid you in replacing restricted essential materials, help you in developing new products, or suggest important changes in your present processes.

2, 2, 3, TRICHLOROBUTYRIC ACID*

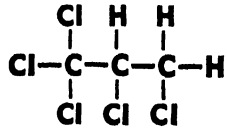
$CH_3 \cdot CHCl \cdot CCl_2 \cdot COOH$

PHYSICAL PROPERTIES:

Appearance—white crystalline solid.
Molecular Weight—191.5.
Melting Point—60° C.
Boiling Point—236° C. with only slight decomposition at the boiling point.
Hygroscopic.
A slightly stronger acid than trichloroacetic acid.
Mild odor.
Soluble in water.
Soluble in organic solvents.

*Available as a white crystalline solid, in 60% aqueous solution, or in other strengths.

SUGGESTED USES:



Its similarity to trichloroacetic acid suggests its application where a rather strong organic acid is needed. It appears to have possibilities as a tanning assistant. As an intermediate, it enters into the usual acid reactions forming salts and esters, and in addition it contains reactive halogens greatly increasing its value for the synthesis of further useful compounds.

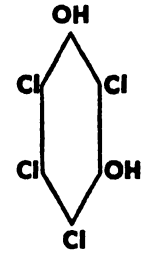
A full series of aliphatic and other esters have been prepared in our Research Laboratories and are available in research quantities.

Many of these esters are characterized by a fine odor which suggests the possible use of the lower members of the series in soaps, perfumes, and other articles in which fragrance is desirable. The higher aliphatic and polyhydric alcohol esters such as the glycol esters, on the other hand, being practically without odor, but of high viscosity, are potential plasticizers. Formulators will be interested in the penetrant and solvent properties of many of these new materials. Leather, textiles, and paper are a few of the fields suggested for possible use.

1, 1, 1, 2, 3, PENTACHLOROPROPANE

$CCl_3 \cdot CHCl \cdot CH_2Cl$

PHYSICAL PROPERTIES:

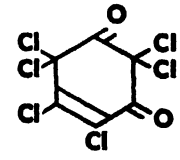


White crystalline solid.
Melting not lower than 178° C. for pure grade, 140° C. for technical grade.
Sublimes.
Has odor of camphor.
Soluble in organic solvents.
Insoluble in water.

SUGGESTED USES:

Its odor suggests its use as an insect repellent. Its compatibility with nitrocellulose and other plastics indicates possible plasticizer value. As an intermediate, it can be dehalogenated, dehydrohalogenated, and enter into other organic halide reactions, producing additional interesting compounds.

TETRACHLORORESORCINOL



$C_6Cl_4(OH)_2$

PHYSICAL PROPERTIES:

White crystalline solid.
Melting point—141° C.
Faint pleasantly phenolic odor.
Soluble in organic liquids, hot water or dilute alkali—sparingly soluble in cold water.

CHEMICALLY, it is a mild reducing agent, and with chlorine yields* hexachlorocyclohexene-1-dione, 3-5, a quinone of interesting possibilities:

*Beilstein, Vol. VI page 820

SUGGESTED USES:

Condensation of this resorcinol for the preparation of eosin-type derivatives should lead to a series of compounds of possible dyestuff interest. Its antiseptic use is indicated as of probable practical value. In these days of need for phenolics, this compound will probably receive careful evaluation as to uses.

We shall be glad to send samples for investigation and to cooperate with you in working out applications. Probable prices of commercial quantities, when available, supplied on request. Write Dept. CEN.

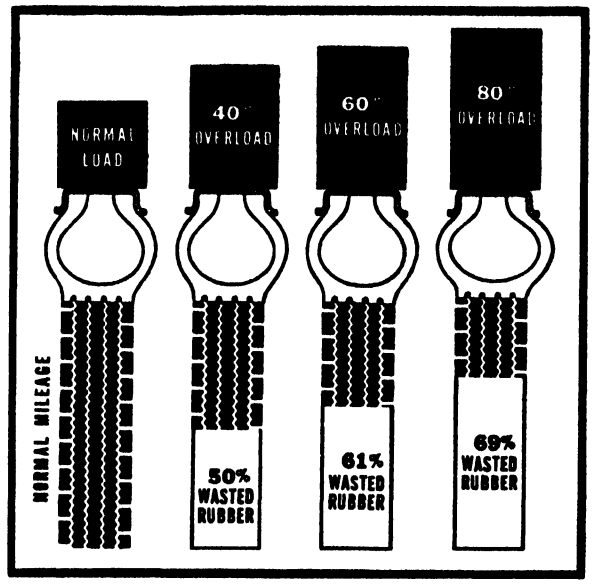
Coutlee. It has a circulation of 75,000 copies and is distributed as part of the professional service program of Merck & Co., Inc., Rahway, N. J.

Bibliography Issued on War Production



A BIBLIOGRAPHY on war production has been issued by the War Production Board. Prepared by the Legislative Reference Service, Library of Congress, the pamphlet, "Selected Documentation of the Economics of War", cites authoritative books, articles, and other materials for writers, students, public speakers, research workers, and others desiring to appraise the Nation's production effort. The four major parts are The Economics of War, Mobilization of Resources, Fiscal Policy and Consumption Control, and Economic Warfare. Copies are available from the Division of Information, War Production Board, Washington, D. C.

Fire Protection

THE first issue of *High-Pressure*, a new house magazine published by Walter Kidde & Co., Inc., New York, N. Y., has appeared as a successor to the company's 15-year-old paper *Lux-Rich Reports*. *High-Pressure*, an 8-page publication, is a profusely illustrated review of recent developments in fire protection and in the handling of compressed gases.

Mineral Trade Notes Suspended

TO AVOID circulation of information that might be of aid to the enemy, the U. S. Bureau of Mines has suspended publication of *Mineral Trade Notes* for the duration of the war.

Saving the Rubber in Tires

The great waste of rubber which occurs when a truck or bus is loaded beyond the rated weight-carrying capacity of the tires on which it rides is illustrated in this chart, one of many in a pocket-size booklet recently published by The Firestone Tire & Rubber Co., Akron, Ohio. The booklet, "How to Get More Mileage from Your Tires and How to Keep Your Trucks Operating More Economically", is available free of charge on request to the company. Besides the importance of correct tire inflation, the publication covers correct load distribution, the stage at which a tire should be removed for treading, information on the treating of minor cuts, and many other subjects.

Who Makes It?

SOURCES for the following chemicals are wanted by the National Registry of Rare Chemicals, Armour Research Foundation, 33rd, Federal, and Dearborn Streets, Chicago, Ill.:

Tricaprylin (glyceryl tricaprylate); magnesium sulfide; cathepsin; bromelin (pineapple); dysprosium; lutecium; terbium; divinylbenzene; vinyl methyl ether; and vinyl carbasol.

Welding Method Makes All-Magnesium Planes Possible

A WELDING method for magnesium which will make possible all-magnesium airplanes has been perfected by Northrop Aircraft, Inc. The process, called the "heliarc", makes possible the arc welding of magnesium sheets, extrusions, and tubings into structures simpler, lighter, and stiffer than possible in conventional duralumin construction.

Development of the method was revealed by Thomas E. Piper, process engineer of the company, in an address to the American Welding Society June 18. In addition to Mr. Piper, the men chiefly responsible for the advancement are V. H. Pavlecka, chief of research, and Russell Meredith, welding engineer. Full details are being made available to the entire American aircraft industry by Northrop.

Mr. Piper declined to discuss possible gains in speed and range through use of magnesium construction. He said, however, that by doing away with the rivets that go into conventional planes, the process makes available to aircraft manufacturers the same savings in time and cost which have been experienced in welded ship construction.

E. C. Williams, director of General Mills Inc., and vice president in charge of research, has been elected a director of the United States Industrial Alcohol Co.

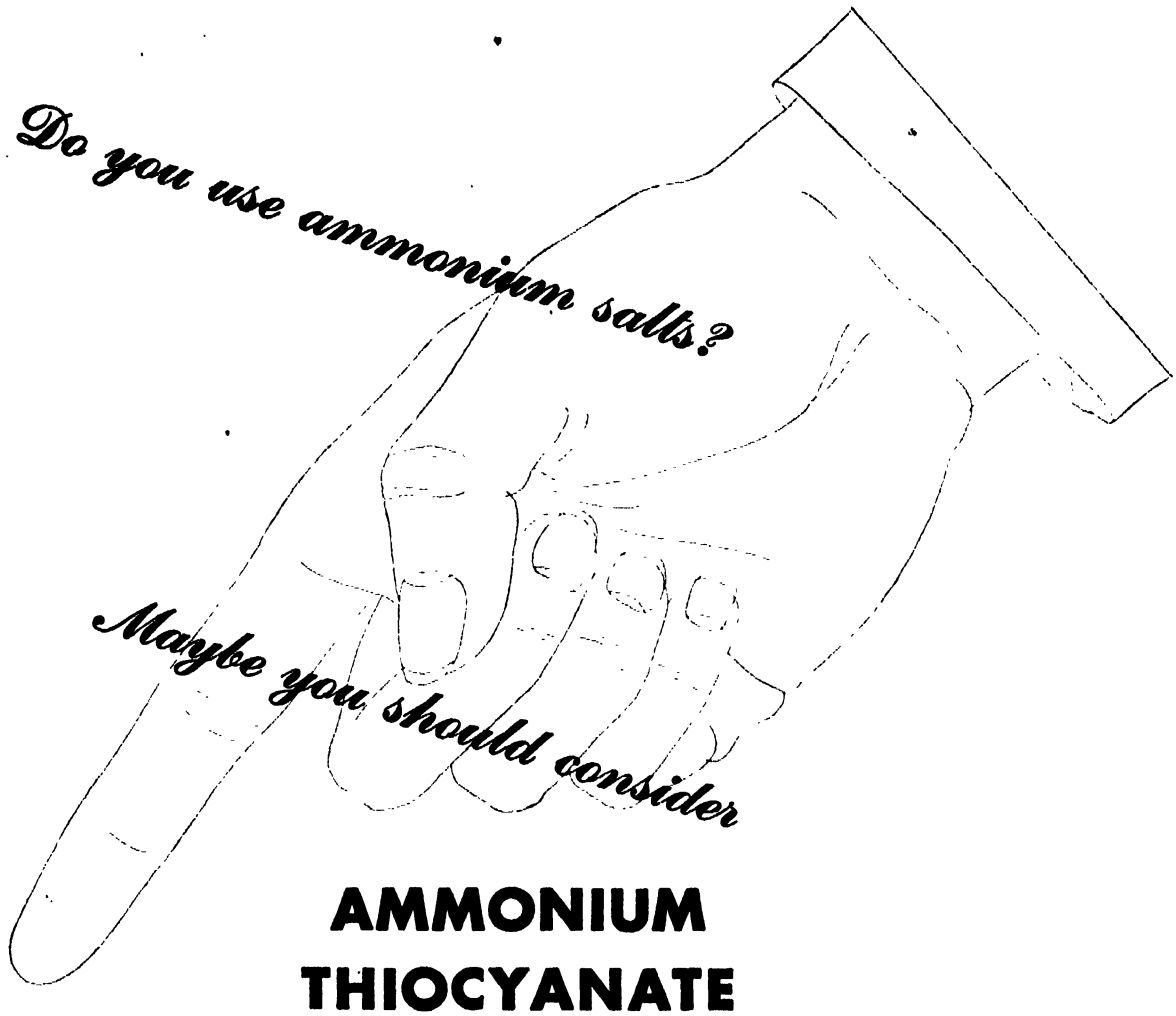
Specify Florite Desiccant



For Efficient Dehydration of GASES and LIQUIDS

FLORITE, the new granular drying agent, is now being used successfully for dehydrating natural gas, propane, gasoline, air, nitrogen, carbon dioxide and other gases and liquids where high drying efficiency is required.
It selectively adsorbs 4 to 20% of its weight in water, depending upon the particular application, and is regenerated by heating to 300-350°F. FLORITE is hard, stable, non-corrosive, non-poisonous, and is available in a variety of particle size classifications.

[illegible] LIBERTY AVE. WARREN, PENNA.

AMMONIUM THIOCYANATE

(AMMONIUM SULFOCYANIDE)

Here is a newly-available ammonium salt with interesting possibilities introduced by the thiocyanate group.

If you are now using an ammonium salt in your processes . . . such as chloride, acetate, oxalate, carbonate or nitrate . . . perhaps you will discover valuable modifications by substituting ammonium thiocyanate.

It is worth testing in your laboratory.

Ammonium thiocyanate has a behavior similar to other ammonium salts, but it also brings you all the variations of the thiocyanate group.

This group is remarkably stable and, in many reactions, resembles the halogens.

Koppers has recently placed in operation a large commercial plant for the production of ammonium thiocyanate crystals and can now offer this chemical in quantity at substantial savings over former costs. Koppers can supply ammonium thiocyanate in crystal form having a minimum purity of 95%.

Test samples, quotations and other information sent on request.

NOW GRIND "TWICE AS MUCH IN HALF THE TIME" for a 300% Greater Production

A nationally known manufacturer of fluorescent lamps recently installed Paul O. Abbé Mills, after having used mills of another make for some time.

They used the same methods on the new machines as they had used on their former equipment. After we had demonstrated to them the use of their Paul O. Abbé Mills, they were able to step up production to four times the volume they had obtained with their former equipment.

YOU, TOO, WILL FIND that our Sixty-Three Years of Experience will aid you to meet today's demand for greater production.

BALL & PEBBLE MILLS • CUTTERS • GRANULATORS • PULVERIZERS • MIXERS

TIME CONSCIOUS?

We're all keeping an eye on our watch these days. Industry is racing against time to produce quantity and quality at record speed. • With laggard production methods we will be too late to meet the stepped-up demands of our customers and the intensified competition of a nation at war. • With a separation step that is being accomplished by gravity settling, can you afford to wait for subsidence *thirteen thousand times as long* as would be the case when using a Sharples Super-Centrifuge? If your pump is feeding a centrifugal instead of filling a settling tank, a large part of your finished product may be on its way to a customer before the settler would be normally full . . . with settling still to be accomplished. • A Sharples Process is a great time-saver . . . and time is getting scarce. The Sharples Corporation, Centrifugal and Process Engineers, 2328 Westmoreland St., Phila., Pa.

Pinch VALVES

for Abrasive or Corrosive Pulps and Liquids

No metal contacts pulp or liquid

Made with rubber or synthetics, the Masseo-Grigsby Pinch Valve is more resistant to wear than metal valves. Shuts tight even on solid particles... withstands freezing. Useful for solutions which are highly corrosive or which crystallize at normal temperatures and must be handled hot; for solutions or solids which are both corrosive and abrasive. Sizes from 1" to 12". *When writing please state your problem.*

ISOMERIZATION OF PURE HYDROCARBONS

By

Gustav Egloff, George Hulla, and V. I. Komarewsky

Universal Oil Products Company, Research Laboratories and Illinois Institute of Technology

American Chemical Society Monograph No. 88

To all petroleum chemists, engineers and research workers in fields involving organic chemistry this long-awaited treatise will prove to be one of the most valuable scientific works published in 1942. It covers in the greatest detail the results of thousands of experiments in isomerization — the phenomenon responsible for the present high-octane motor fuels and other miracles of petroleum research. Nearly half the volume consists of exhaustive tabulations of reaction data which can be found nowhere else in chemical literature, and which will save untold hours of time on the part of those using them. The text is profusely illustrated with structural diagrams, and the entire book is characterized by the thoroughness and critical exactness of its authors.

CONTENTS

PREFACE, INTRODUCTION.

CHAPTER I. ALKANES.
Methods Used in the Study of Isomerization; Isomerization of Alkanes; Mechanism; Isomerizations; Aluminum Halides as Catalysts; Butanes; Pentanes; Hexanes; Heptanes; Octanes; Other Catalysts; *n*-Butane; *n*-Pentane; Hexanes; Heptanes; *n*-Octane; *n*-Decane; Conclusions.

CHAPTER II. ALKENES, ALKADIENES, AND ALKAPOLYENES.
Isomerization of Alkenes; Mechanism; Isomerizations; Propene; Butenes; Pentenes; Hexenes; Heptenes; Octenes; Decenes; Hexadecene; Conclusions; Alkadienes; Allenic Alkadienes; Conclusions; Non-Allenic Alkadienes; Conclusions; Alkapolyenes; Isomerizations; Conclusions.

CHAPTER III. ALKYNES, ALKADIYNES, AND ALKAPOLYYNES.
Alkynes; Isomerizations; Alkadiynes and Alkapolyynes; Isomerizations; Conclusions.

CHAPTER IV. CYCLANES, SPIRANES, BICYCLANES, AND POLYCYCLANES.
Cyclanes and Cyclanes with Saturated Side-Chains; Mechanism; Isomerizations; Cyclopropanes; Cyclobutanes; Cyclopentanes; Cyclohexanes; Cycloheptane and Larger Cyclanes; Conclusions; Cyclanes with Unsaturated Side-Chains; Mechanism; Isomerizations; Cyclopropanes; Cyclobutanes; Cyclopentanes; Cyclohexanes; Conclusions; Spiranes; Isomerizations; Bicyclanes and Bicyclanes with Saturated Side-Chains; Mechanism; Isomerizations; Bicycloheptanes; Bicyclooctanes; Bicyclononanes; Bicyclodecanes; Conclusions; Bicyclanes with Unsaturated Side-Chains; Isomerizations; Bicyclohexanes; Bicycloheptanes; Conclusions; Tricyclanes; Isomerizations; Conclusions; Pentacyclanes.

CHAPTER V. CYCLENES, BICYCLENES, AND POLYCYCLENES.
Cyclenes and Cyclenes with Saturated Side-Chains; Isomerizations; Conclusions; Cyclenes with Unsaturated Side-Chains; Isomerizations; Conclusions; Cyclodienes with Saturated Side-Chains; Isomerizations; Cyclodienes with Unsaturated Side-Chains; Isomerizations; Conclusions; Bicyclenes and Bicyclenes with Saturated Side-Chains; Isomerizations; Conclusions; Bicyclenes with Unsaturated Side-Chains; Isomerizations; Conclusions; Bicyclodienes with Saturated Side-Chains; Isomerizations; Tricyclenes and Tricyclenes with Saturated Side-Chains; Isomerizations; Conclusions; Tricyclenes with Unsaturated Side-Chains; Isomerizations; Tetracyclenes; Isomerizations; Pentacyclenes; Isomerizations.

CHAPTER VI. AROMATIC HYDROCARBONS.
Alkyl Benzenes; Mechanism; Isomerizations; Conclusions; Alkenyl Benzenes; Mechanism; Isomerizations; Conclusions; Alkadienyl Benzenes; Allenic Alkadienyl Benzenes; Non-Allenic Alkadienyl Benzenes; Conclusions; Alkapolyenyl Benzenes; Isomerizations; Conclusions; Alkynyl Benzenes; Isomerizations; Conclusions; Condensed Aromatics; Indanes and Indenes; Fluorenes; Naphthalenes; Anthracenes; Phenanthrenes; Naphthacenes; Conclusions; Aromatic-Cyclane Hydrocarbons; Isomerizations; Conclusions; Aromatic-Cyclene Hydrocarbons; Isomerizations; Conclusions; Aromatic-Cyclodiene Hydrocarbons; Isomerizations; Conclusions.

SUMMARY — Tables of Isomerization Data of:
Alkanes; Alkenes; Allenic Alkadienes; Non-Allenic Alkadienes; Alkapolyenes; Alkynes, Alkadiynes, and Alkapolyynes; Cyclanes and Cyclanes with Saturated Side-Chains; Cyclanes with Unsaturated Side-Chains; Spiranes; Bicyclanes and Bicyclanes with Saturated Side-Chains; Bicyclanes with Unsaturated Side-Chains; Tricyclanes; Cyclenes and Cyclenes with Saturated Side-Chains; Cyclenes with Unsaturated Side-Chains; Cyclodienes with Saturated Side-Chains; Cyclodienes with Unsaturated Side-Chains; Bicyclenes and Bicyclenes with Saturated Side-Chains; Bicyclenes with Unsaturated Side-Chains; Bicyclodienes with Saturated Side-Chains; Tricyclenes and Tricyclenes with Saturated Side-Chains; Tricyclenes with Unsaturated Side-Chains; Tetracyclenes; Pentacyclenes; Benzenes with Saturated Side-Chains; Alkenyl Benzenes; Alkadienyl Benzenes; Alkapolyenyl Benzenes; Alkynyl Benzenes; Condensed Aromatics (Indanes, Indenes, Fluorenes, Naphthalenes, Anthracenes, Phenanthrenes, Naphthacenes); Aromatic-Cyclane Hydrocarbons; Aromatic-Cyclene Hydrocarbons; Aromatic-Cyclodiene Hydrocarbons; Possibilities of Hydrocarbon Isomerization as Illustrated by the Known Examples to Date.

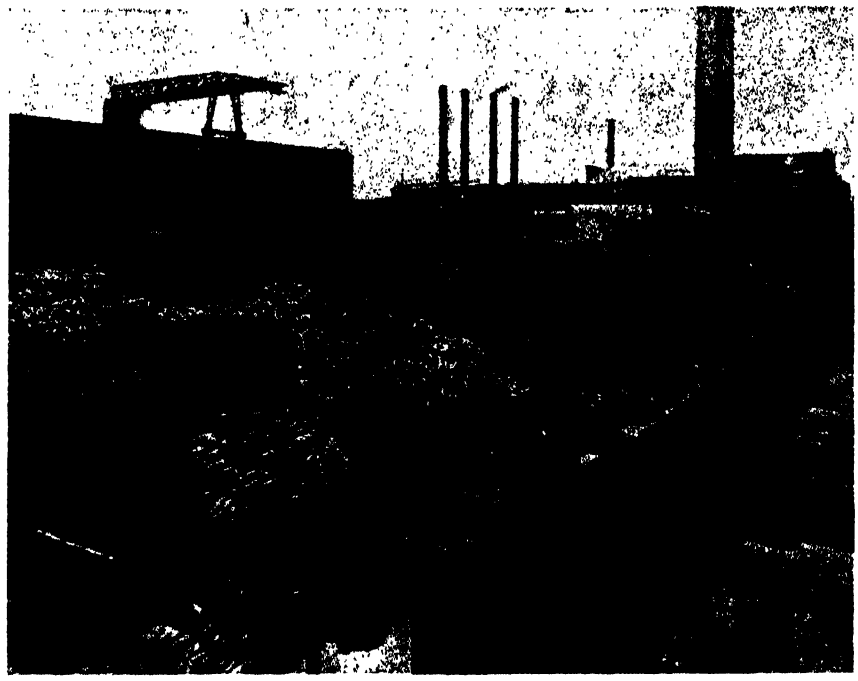
Have YOUR Specialized GLASS APPARATUS *made by* PREFABRICATION

Ace Foresight

The Ace system of manufacturing is based on the principle that a large part of specialized apparatus construction can be accomplished by the assembly of standard parts. In a special room, Ace stores dozens and dozens of special shapes and blanks, ready to be finish-ground or "welded" together to become *your* special apparatus.



Ace Methods Bring Economies

The most vital factor in today's construction is *time*. Ace prefabrication frequently saves days over older methods. *For precision craftsmanship produced by the most modern techniques consult Ace.*

Special 50 liter reaction vessel recently fabricated for a New York pharmaceutical concern.

Rubber for Reclaim

Old tires and inner tubes by the thousands, boots, rubber overshoes, and almost any articles containing rubber are used in making reclaim rubber. Here is a view of the piles of scrap rubber at the Reclaim Division of the B. F. Goodrich Co., Akron, Ohio.

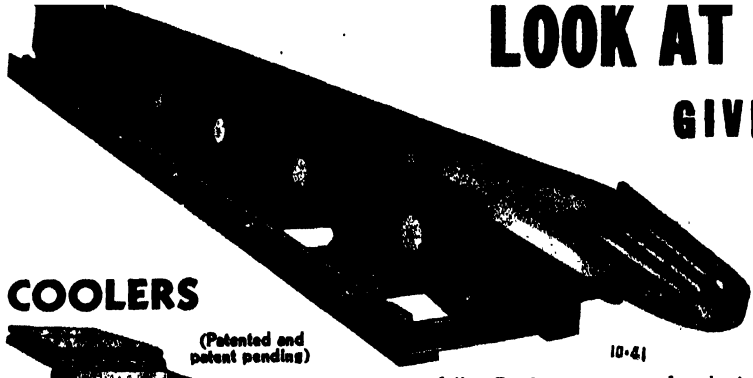
The L. S. O. G. Exchange

Edited by A. A. Ashdown, Ed. F. Degering, J. E. Hawkins, and S. L. Redman

Send items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

THE Southeastern Texas Section comprises 17 counties, exceeding in area the State of Maryland. Fortunately for the unity of effort, the membership is not uniformly distributed over this region. About 60 per cent of the members live near Houston, 20 per cent near Port Arthur, and the remainder are about equally divided between Texas City and Freeport. A majority of the members are engaged in the production or refining of petroleum.

The primary concern of the local section is the promotion of fellowship among chemists in this area, with the secondary objective the furtherance of recognition by the public of chemists' work. Fellowship is fostered by a dinner preceding each lecture and by at least one purely social meeting a year, by sending out a News Letter carrying accounts of some of the personal and professional activities of members, and by encouraging participation in the work of the section through several active committees. Qualified nonmember chemists are invited to become associate members, and some of these subsequently become members of the AMERICAN CHEMICAL SOCIETY.



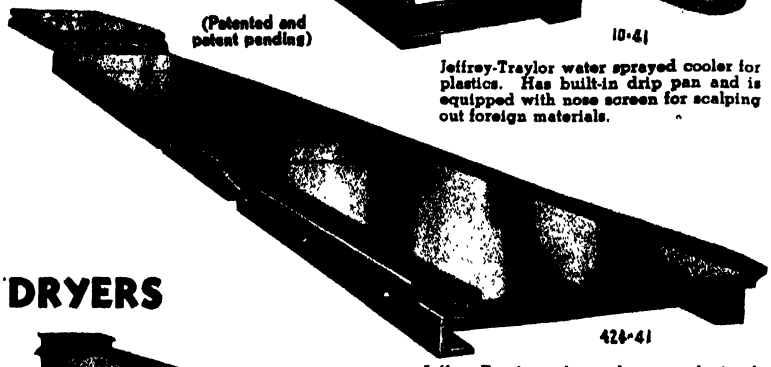
To promote the profession of chemistry, the public is invited through newspaper announcements to hear the outstanding speakers made available by the touring service of the national organization and some additional well-qualified scientists secured by the local program committee. Information on the qualifications of the members is available to the local Civilian Defense Organization. The services of the professional committee are at the disposal of prospective employers and employees.—GEO. R. GRAY, *Southeast Texas Section.*

Western Connecticut Section Elects Officers

THE Western Connecticut Section at its annual meeting elected W. H. Cope *Chairman*, R. J. King *Vice Chairman*, W. C. Moore *Secretary*, T. G. Rochow *Treasurer*, and J. L. Christie, J. A. S. Hammond, and J. T. Thurston *Directors*. Subsequently Mr. Christie resigned, and H. V. Allison was appointed by the Board of Directors of the section to fill the vacancy. These men took office July 1 and will serve for the 1942–43 season. Councilors, elected for the calendar year 1943, are H. L. Fisher, E. C. Sterling, and R. C. Swain.

LOOK AT THESE THREE UNITS

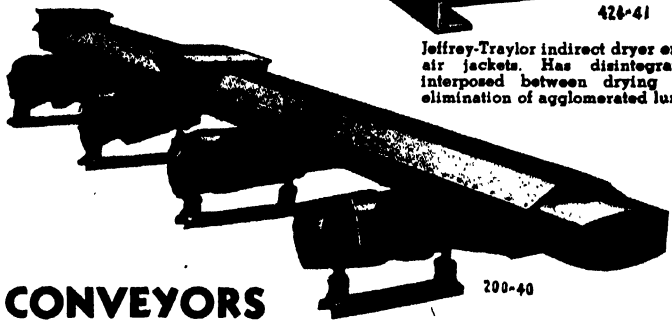
GIVE BALANCED VIBRATION TO PROCESSING OPERATIONS



COOLERS

(Patented and patent pending)

10-41



Jeffrey-Traylor water sprayed cooler for plastics. Has built-in drip pan and is equipped with nose screen for scalping out foreign materials.

DRYERS

426-41

Jeffrey-Traylor indirect dryer employing hot air jackets. Has disintegrating screen interposed between drying sections for elimination of agglomerated lumps.

CONVEYORS

200-40

In Jeffrey-Traylor drying and cooling systems the rate and depth of material being conveyed is automatically controlled—changed to conform with varying requirements as material travels through various operations.

Direct type coolers and dryers furnished with either perforated or louvered coveying surface through which drying or cooling air or gasses are passed. Indirect type have solid conveying surface, adaptable for handling fine materials. These units specially valuable for processing under closely-controlled conditions.

Jeffrey-Traylor electric vibrating conveyors (left-below) handle hot, gaseous material without dust loss or degradation. Tubular or pan types in various sizes and capacities. Positive control over tonnage.

Process Cuts Wastage of Mercury in Fluorescent Lamps

ENGINEERS of Hygrade Sylvania Corp., Salem, Mass., have developed and patented a method to cut by approximately 50 per cent the amount of mercury used in the manufacture of fluorescent lamps. The new process eliminates the wastage resulting from previous methods. The exact amount of mercury needed for the lamp, down to the last milligram, is enclosed in a tiny metal tube affixed to a support lead of one cathode. When the current is first turned on in the lamp, during the exhaust process, the heat expands the mercury and the tubing explodes, releasing the free mercury.

Electronic Control Guards Furnace Atmosphere

TO INCREASE production and safeguard quality of steels treated in atmosphere furnaces, a special electronic tube, developed by Westinghouse electronic research engineers, provides a continuous check on the purity of the hydrogen gas flowing over the metal. Such scientific control is especially important where the dew point of the treating gas must be maintained in the critical region of −40° to −70° C., or for precise furnace conditions such as required for bright annealing, and for chemical processes, using purified dry hydrogen or similar controlled gases.

A continuous sample of purified hydrogen gas (in the hose at the top, out by the hose at base) for heat treating steel in atmosphere furnaces through this two-element tube. If moisture or oxygen is in the gas, the tube passes less current as many of the electrons emitted by the filament are converted into negative ions by water or oxygen.

To give the metal proper characteristics, steel is often heated in an atmosphere of highly purified hydrogen, practically free of moisture and oxygen. Ordinarily, to measure moisture in the gas where dew points are less than 0° C., a cooled and polished metal plate is inserted in the gas stream and the temperature noted when condensation of moisture first occurs. Below −40° C. this method becomes largely guess work, and even skilled testers disagree on values of the same gas. The electronic method ensures reliable and accurate determination of moisture and oxygen content in hydrogen, or dissociated ammonia, gas.

New Butadiene Process Reported

A NEW process for making butadiene from grain has been reported by H. F. Willkie, vice president of Joseph E. Seagram & Sons, Inc., Louisville, Ky., which produces about 8 pounds of rubber per bushel, as compared with 6 pounds by other methods. The company has prepared plans for a plant to process 55,000 bushels of grain a day.

W. W. Deschner, formerly in charge of the Department of Chemical Engineering, University of Kansas, has become the new head of the division of chemical design, engineering, and construction at J. F. Pritchard & Co., Kansas City, Mo. The division has been greatly enlarged recently to meet growing requirements of the new petrochemical industry.

RAYMOND Laboratory Mill

Ask for Bulletin 48

Containing detailed descriptions of Raymond Laboratory Mills and Separators.

This small capacity grinding unit is specially designed for experimental work, as required by testing engineers, industrial laboratories, colleges and government stations.

- Adaptable for pulverizing small batches of dry materials (except abrasives) from a few ounces to several pounds at a time.
- Available with hand-operated feeder, as illustrated, or with motor-driven feeder incorporating variable speed control.
- Furnished with a set of screens with different size perforations to give various degrees of fineness.
- Easily taken apart for cleaning or interchanging screens.
- Produces the *same character* of finished material as the large commercial mills.

Raymond also builds an 8-inch and a 12-Inch Screen Mill for semi-commercial use, also a line of larger Screen Mills for industrial production.

KEEP 'EM FLOWING!

We refer to the vapors being removed from thousands of Condensers and Processing Vessels by Croll-Reynolds Steam Jet Evactors. Production Equipment for this apparatus is being pushed to keep up with what seems to be an ever-increasing demand. Now, even more than ever, we are eager to help the operators of the many thousands of Croll-Reynolds Evactors get the maximum performance from existing equipment.

In some cases vacuum can be increased by merely changing the nozzles. Capacity can often be increased by changing the nozzles and throats or by re-machining them. It is our policy to keep in stock rough castings for throats and suitable materials for nozzles which can be promptly machined for individual conditions on prevailing priorities. Complete new Evactors for vacuum to a small fraction of 1 mm. are still being made subject to crowded conditions on ordnance equipment.

FLUORESCENT BALANCE LAMP

Directed Frontal Illumination

Mounted at the front of the balance case, the *parabolic reflector* directs all light over the entire working area of the balance.

The lamp is rigidly supported by a clamp which cannot mar the case finish, can be attached to all makes and styles of balances, and when in position permits free movement of the sliding door. The weight of the reflector is greatly reduced by making a separate unit of the auxiliary so that it can be placed on the laboratory bench close to the balance.

The G. E. fluorescent tube supplied with the lamp produces approximately 750 hours of glareless, efficient light of daylight quality.

S-3820 Balance Lamp, Fluorescent, Sargent. Complete with No. S-44285, T-5 fluorescent tube $11.50

S-44285 Fluorescent Tube, T-5, 8 watts. For replacement. Each $1.10

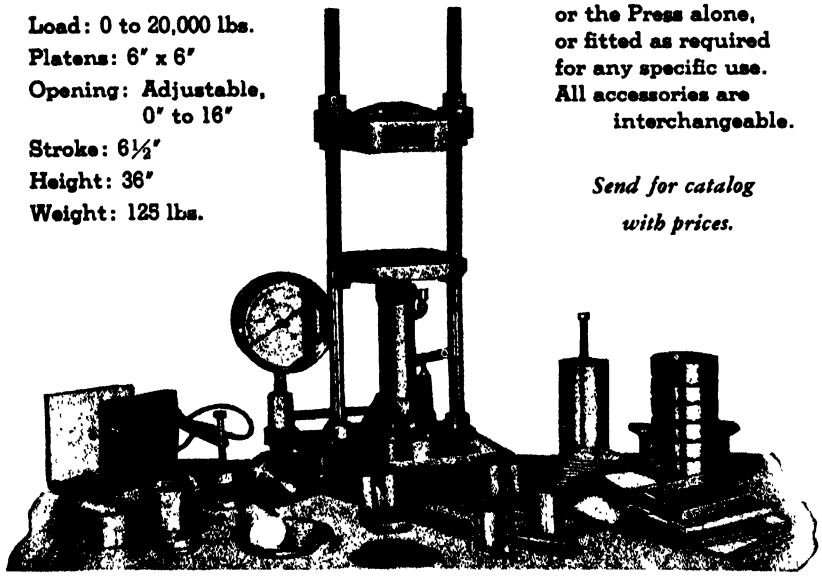
	Six Months' Earnings		Per Common Share	
	1941	*1942*	*1941*	*1942*
Celotex Corp.	$ 761,235	$ 518,013	$1.07	$0.69
Devoe & Raynolds Co.	301,768	423,036	..	..
Firestone Tire & Rubber Co.	4,789,165	5,193,024	1.75	1.97
Mathieson Alkali Co.	997,344	556,092	1.10	0.57

The **Celanese Corp. of America** on June 23 filed with the SEC a registration statement covering a new issue of $35,000,000 of 3.5 per cent debentures due July 1, 1962. The purpose of the financing is to refund and consolidate the company's outstanding funded debt, including the retirement of approximately $24,700,000 outstanding 3 per cent debentures and $3,000,000 bank loans and provide additional funds for general corporate purposes. The debentures will constitute the company's only funded obligations.

The **Firestone Tire & Rubber Co.** reports that provision for excess profits taxes for the six months ended April 30 was 8.5 times greater than in the like period in 1941. Sales volume was substantially greater than in 1941, which was at a record level for the fiscal year ended October 31, 1941.



Charles Pfizer & Co., Inc., on June 10 filed with the SEC registration statement covering an offering of 240,000 $1.00 par common shares. The names of 66 firms which will underwrite the offering have been filed in an amendment.

The **U. S. Industrial Alcohol Co.** and subsidiaries have reported a net profit of $1,996,077 for the year ended March 31, after deducting $1,950,000 for federal income taxes and $1,500,000 provision for contingencies. This is equal to $5.30 per share on common and compares with $836,305 or $2.14 a share in the preceding fiscal year. Because of loss of tankers the company has had difficulty in supplying its three East Coast plants with molasses and is consequently converting two plants and part of a third to the use of grain. Much of this alcohol is expected to be used in the rubber program.

EMANATIONS

Speech of a Figure

I am a statistic.
Born in the fiscal year ending June 30,
Sired by Capital, whelped by Labor,
And delivered into this veil of lies by Management.

I am a statistic.
For me spruce falls, methane is pyrolyzed,
Caoutchouc is worn away,
And the entropy of graphite increaseth.

I am a statistic.
For me lovely figures dance
In ever curving paths of mystery
With polar, Napierian, and Cartesian coordinates.

I am a statistic.
For me fact-fumblers fidget
In the awesome presence of the Executive,
Knowing I am only the shadow of a fact.

I am a statistic,
Mangled by millions ministering to desire.
But when the marauders, merchant and martial alike,
Are laid end to end, I alone will remain—
I, the statistic.

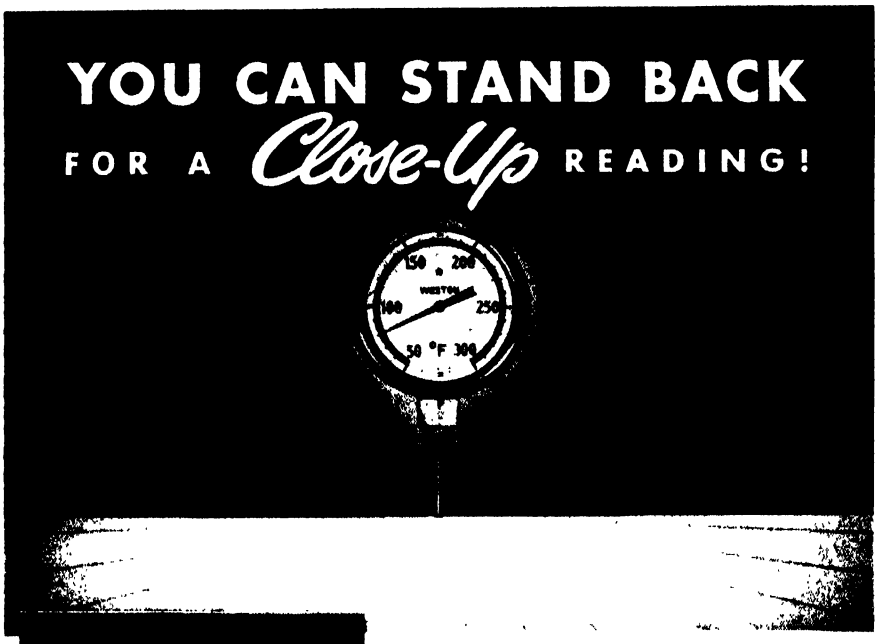
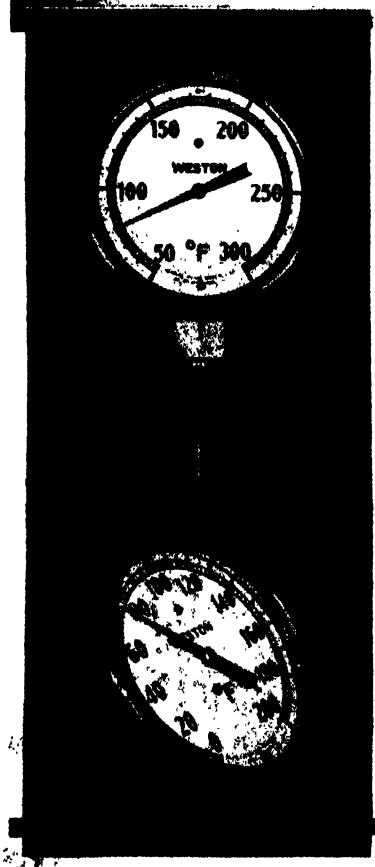
Aluminum Cleaner

When the automobile industry began gearing for the production of aircraft, it tried to cut down the time required to produce the units it was to build. One of these operations was the surface condition of aluminum prior to spot-welding.



After several months of research the Nielco Laboratories, 19720 Florence Rd., Detroit, Mich., produced an alkali cleaner that reduced the time required to clean a sheet of aluminum to a perfect water-shed without building up an oxide coating.



Crate Carrier

One of the newest developments of the Cleveland Tramrail Division of The Cleveland Crane & Engineering Co., Wickliffe, Ohio, is the motor-driven crate grab and carrier especially designed for handling crates and boxes in and out of storage, or from one elevation to another.

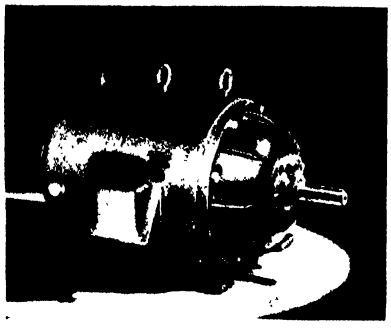
New Blackout Bulb

A new blackout bulb which can be kept burning for emergency lighting without the need for window shades or blinds has been approved by the War Department and is ready for use in war plants and government buildings, the Lamp Division of Westinghouse, Bloomfield, N. J., has announced. The bulb gives a faint glow of orange light sufficient to distinguish objects in a room but not enough to be visible from the air even though placed directly in line with an open window. Although the bulbs are available only on high priority ratings, the War Production Board may permit civilian use of the new blackout bulbs in sections of the country defined as blackout areas.

The blackout lamp is coated with an outer covering of black except for an orange-red opening through which a narrow beam of light passes. The downward direction of this beam prevents any direct rays of light from being seen by planes. Operated at 15 watts, each bulb will provide emergency lighting for an area of approximately 200 square feet.

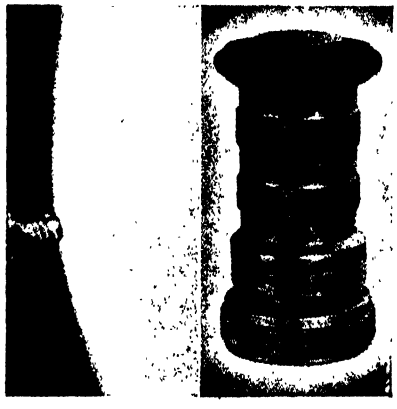
Temporary Transparent Coating



To reduce rejects caused by rust, surface scratches, shop wearing, grease, and dirt, a new protective coating for metal and ceramic surfaces is announced by Ault & Wiborg Corp., Cincinnati, Ohio. Known as Protektol, the material is completely transparent to permit visual inspection of the coated parts.

In application, the liquid is sprayed, brushed, dipped, or roller coated, then air-dried to leave a flexible glass-clear coating of from 0.001 to 0.0015 inch. One gallon, when sprayed to a thickness of 1 mil, will cover approximately 250 square feet of surface. Drying time at 200° F. is 6 to 8 minutes. The coating may be peeled or blown off with an air jet. After being removed, Protektol may be returned and

reduced to liquid form. This process is said to be simple and may be repeated again and again, lowering coating costs to a minimum.



Motors for Magnesium Dust Locations

A NEW line of polyphase induction motors in sizes from 1 to 20 horsepower, NEMA frames 203 to 326 inclusive, suitable for use under magnesium dust conditions has been announced by the General Electric Co., Schenectady, N. Y. Labeled as suitable for Class II, Group E locations, the new line has been developed to meet a need brought about by the extensive use of magnesium and aluminum in war production. In many cases, motors are being subjected to these metals in the form of fine powder, as used in incendiary bombs and for other military purposes, or from castings during grinding or polishing operations. Since these dusts are extremely combustible, they present a hazard classified by the National Electrical Code as Class II, Group E, requiring special motors and control.

The motors are totally enclosed, with a nonventilated construction in the smaller ratings and a fan-cooled construction above 2 horsepower. Simple cast-iron end shields, stator frames, and fan housings make possible dust-tightness without complicating assembly or disassembly.

All-Spray Nozzle

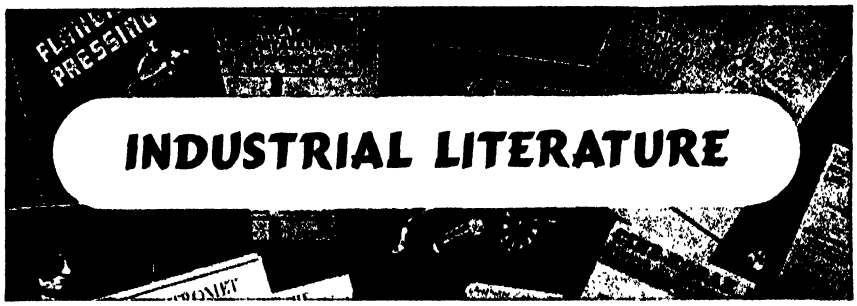
TO MEET the demands for a variable all-spray nozzle, without a straight stream, a new water spray nozzle, the Alfco-spray, has been introduced by the American-LaFrance-Foamite Corp., Elmira, N. Y. It prevents possibility of a solid water stream being applied inadvertently on live electric circuits. The varying cones are excellent for extinguishing of heavy oil fires, and for general cooling purposes.

NATIONAL FOAM!

Wind is fire's best friend—and the worst enemy of most foams! But National Foam is exceptionally *wind-resistant.* It settles down over a fire in a tough smothering blanket of bubbles that *stick!*

The stabilizer responsible for this was developed in National's laboratories—and typifies the research facilities which National can bring to bear on *any* fire-hazard problem!

Yet this is only part of National's service. An experienced engineering staff is ready to study your fire-hazards . . . and design a built-in or portable system to meet them. Recommendations will be made without obligation to you. Write for Bulletin D-3.



NATIONAL FOAM SYSTEM, INC.

Fire-Protection Specialists in the Chemical and Metallurgical Industries

PHILADELPHIA NEW YORK CHICAGO

"EVERY INGREDIENT OF NATIONAL IS AMERICAN"

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Acid Pumps. This 4-page bulletin describes an improved line of centrifugal acid pumps. All parts coming in contact with liquids are fabricated from Ceratherm, a new stoneware offering excellent heat-shock resistance as well as the corrosion-resistance of chemical stoneware. The bulletin gives characteristic performance curves for four different size pumps and specifications. *Bulletin 702 CEN.* United States Stoneware Co., Akron, Ohio.

Automatic Control. A 12-page bulletin gives information concerning the application of automatic control instruments in synthetic rubber processes. *Bulletin 103 CEN.* The Bristol Co., Sales Promotion Dept., Waterbury, Conn.

Automatic Control of Gas Pressure. A 12-page data folder discusses the application of telemetering to the measurement of gas distribution pressures. *Data Sheet 39 CEN.* The Bristol Co., Sales Promotion Dept., Waterbury, Conn.

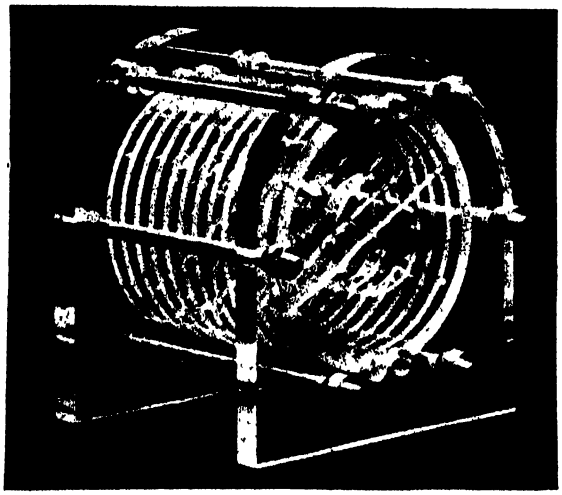
Automatic Gas Saturation Control. A bulletin on systems of automatic control for regulating gas saturation in natural gas distribution systems contains sketches to show methods of use. *Data Bulletin 43 CEN.* The Bristol Co., Sales Promotion Dept., Waterbury, Conn.

Axiflo Fans. Although United States Navy requirements prevent the offering of these fans to industrial buyers, this bulletin is presented so that industrial engineers can become familiar with their engineering characteristics. The fans, intended primarily for heating, ventilating, and air-conditioning work, are available over a wide range of pressures from 1/2 to 60 inches. Operating characteristics and construction details are given ample illustration in this 8-page book. *Catalog 460 CEN.* B. F. Sturtevant Co., Hyde Park, Boston, Mass.

Carbon and Graphite Corrosion-Resistant Pipe, Tubes, and Fittings. In this 8-page booklet the authors have combined well chosen photographs with drawings in describing this line of fittings. Physical characteristics and a table of chemical resistance show the types of service for which this material may be used. In connection with the heat exchange units, sheets show comparative over-all heat transfer. Types of joints are illustrated and dimension tables round out the bulletin. *Catalog Section M-8800A CEN.* National Carbon Co., Inc., Cleveland, Ohio.

Chemical Proportioner. A concise data page describes the working characteristics of this chemical proportioner. Recent tests are said to give it an accuracy to within 2 per cent at all rates of flow of raw water into treating plants. These units are designed so that they may be located at any distance from the meter or control device. *Bulletin 310 CEN.* Graver Tank & Mfg. Co., Inc., East Chicago, Ind.

Corrective Chemical Feeding. In this 12-page booklet the authors have described a number of units for water treatment. The heart of the unit is an electromagnetic proportioner designed for accurate and automatic proportioning of chemicals needed for water purification. A table of sizes and capacities is included. *Corrective Chemical Feeding Booklet CEN.* American Water Softener Co., Lehigh Ave. and Fourth St., Philadelphia, Penna.



Electronic Control. This bulletin deals with the latest electronic control which automatically regulates feeding rate in accordance with different materials and varying conditions. Operators of pulverizing machines can learn from the bulletin, it is said, how to step up output from 20 to 35 per cent above usual operating capacity. *Automatic Control for Mechanical Feeders on Pulverizing Machines Bulletin CEN.* Max Mosher, 130 West 42nd St., New York, N. Y.

Fire Fighting. A three-color poster shows the correct method of using carbon dioxide, water, and foam and vaporizing liquid fire extinguishers and gives hazards for which each type is suited. *Fire Extinguishers, How to Use Them Poster CEN.* Walter Kidde & Co., 140 Cedar St., New York, N. Y.

Good Operating Practices. Under this title the manufacturer offers a series of suggestions, helpful for wartime conservation, on getting the most service out of packings, insulations, roofings, friction materials, and refractory cements. *Form PP-9A CEN.* Johns-Manville, 22 East 40th St., New York, N. Y.

Heat Dryers. This 8-page bulletin describes a dryer originally designed for handling coal, but now offered for use with similar granular materials. Material to be dried is delivered to a screen

BROSITES MACHINE COMPANY, Inc.

Chemical and Process Machinery

50 CHURCH STREET, NEW YORK, N. Y.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

GRADUATE RESEARCH assistant ($2000) in field of colloids; war effort; academic credit. Transcript of record and testimonials to J. W. McBain, Chemistry Department, Stanford University, Calif.

ANALYTICAL CHEMIST, to develop methods for new organic chemicals, with manufacturer of fine chemicals in East. Recent Ph.D. or man having industrial experience with newer methods and instruments preferred. Send complete details with first letter, including photograph, draft status, religion, availability, personal data, education, and industrial experience.
Box 19-N-7, Ind. & Eng. Chem., Easton, Pa.

GRADUATE FELLOWSHIPS still available. Large eastern university. Half tuition and $700.00 cash. Recipient may carry nine credit hours of study but must devote half his time to assisting. Young women considered.
Box 22-N-7, Ind. & Eng. Chem., Easton, Pa.

RESIN CHEMIST. Recent graduate preferred. Research work in the field of urea-formaldehyde, phenol-formaldehyde resins. Opportunity for interesting work and advancement. Organic chemistry essential. Practical background helpful but not necessary. Give complete details in application, recent snapshot, salary expected. Location New York state small town.
Box 23-NP-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER or chemist with experience in development and manufacture of molding compositions, preferably thermosetting. Location in Midwest. State salary expected and draft status. Give details of education and past experience.
Box 58-NP-7, Ind. & Eng. Chem., Easton, Pa.

SUCCESSFUL SOUTHERN chemical company desires man for original research work in organic chemistry. Individual will be able to work largely on own initiative, and position offers excellent opportunity. Give full particulars, including draft status.
Box 64-NP-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH ASSISTANTSHIP or graduate student fellowship available at large Eastern Canadian university. New research project. Bachelor degree and preferably one year research experience in organic or biochemistry required. Applications considered from men and women. Give full information, references, and photograph.
Box 80-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER or individual thoroughly conversant with processes of powdering magnesium. Only experienced practical man need apply. Write giving full details. Also outline methods familiar with.
Box 13-T-7, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST for pharmaceutical house. 3 to 5 years' experience in analytical chemistry. Able to develop analytical methods for newly synthesised organic compounds. Must be familiar with micro-analytical methods. Control on manufactured products. Competent to take charge of laboratory. Give full information. Plant located near New York City.
Box 14-TP-7, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, M.S. or preferably Ph.D. for research literature searches and library work in Midwest industrial research laboratory. Reading knowledge of French and German desirable.
Box 18-T-7, Ind. & Eng. Chem., Easton, Pa.

TEACHER of CHEMICAL engineering desired by Southern agricultural and mechanical college, to begin September 1. Instructor, $1800 for twelve months, M.S. Degree in Chemical Engineering and some teaching experience preferred. Give full details of training and experience.
Box 19-T-7, Ind. & Eng. Chem., Easton, Pa.

ANALYST for RESEARCH laboratory in wood chemistry, Pacific Coast University, experience in wood chemistry desirable but not essential. Wood, organic, or biochemistry background preferred. Women eligible. $1800-$2000.
Box 20-TP-7, Ind. & Eng. Chem., Easton, Pa.

POST-DOCTORATE research fellowship in physical chemistry at large eastern university. Microcalorimetry of solutions; opportunity for other types of physico-chemical measurements applied to biochemistry. Fellowship renewable. Give details of education, experience, references, etc. $2400 per annum minimum.
Box 28-T-7, Ind. & Eng. Chem., Easton, Pa.

WANTED: RECENT graduate, chemist, with rubber laboratory experience. Class three draft status. Akron district.
Box 39-TP-7, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS—ANALYTICAL and research for established laboratories in the fermentation and beverage field in New York area. Submit details of training, experience, references and draft status if male.
Box 41-TP-7, Ind. & Eng. Chem , Easton, Pa.

INSTRUCTORSHIP, General Chemistry, perhaps also assist in Biochemistry. Start in September, position open for duration of war. Ph.D. desired, man or woman. First letter must give education, experience, personal data, recent photograph, references, lowest salary. Write Gilbert H. Ayres, Chairman Chemistry Department, Smith College, Northampton, Mass.

WANTED: METALLURGIST capable of overseeing the production of straight carbon and alloy steel castings, acid electric furnace, steel foundry located in eastern Pennsylvania. In reply state age, experience and salary desired.
Box 57-T-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH FELLOWSHIP in organic research or analysis, available in September. Work for advanced degree, majoring in analytical or organic chemistry. Qualifications: B.S. or M.S. with a good grounding in analytical or organic chemistry. Stipend $770 yearly. Send applications to H. B. Hass, Dept. of Chemistry, Purdue University, Lafayette, Ind.

CHEMICAL ENGINEER with a few years' chemical manufacturing experience, as assistant to Superintendent of chemical manufacturing plant. Location southern New Jersey. Apply by letter, stating qualifications and salary desired.
Box 73-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER excellent opportunity for man of outstanding qualifications in research division of food organization located in the East. Applicant should submit college record, experience, accomplishments, and small photo.
Box 75-TP-7, Ind. & Eng. Chem., Easton, Pa.

UNUSUAL OPPORTUNITY for capable chemist experienced in thermoplastic coating materials and formulations. Will consider part-time arrangement if you have permanent connection. State experience, age, past connections, etc. Application confidential.
Box 80-T-7, Ind. & Eng. Chem., Easton, Pa.

HERE IS A RARE OPPORTUNITY FOR A YOUNG SALES ENGINEER

We are probably the fastest-growing manufacturer of chemical and process equipment in the country. There is an opening in our New York Office, involving general sales work on items like piping, tanks, valves, linings, synthetics, etc. A technical engineering background would be desirable but a good sales personality will weigh more with us.

Can you fill the bill? Tell us your age, qualifications, previous history and any other information about yourself that will aid us in sizing you up. We'll make the salary worth while.

Box 38-TP-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER with thorough training in engineering and chemical principles; also with some experience in research, testing, and practical commercial problems related to chemical engineering materials and equipment, for position on research and development staff of established organization pre-eminent in its field. Location New York City. Apply by letter, stating qualifications and salary desired.
Box 74-TP-7, Ind. & Eng. Chem., Easton, Pa.

FOOD TECHNOLOGIST. Applications will be welcomed from men with outstanding records to serve as junior chemists in eastern Research Laboratory. Prospects for advancement excellent for men of right qualifications. Please submit record of training and experience, personal history and recent small photo.
Box 76-TP-7, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SPECIAL LIBRARIES ASSOCIATION will recommend trained chemical and technical men and women librarians at no cost to employer or member. Competent persons are now available. Write to the Executive Office, 31 East Tenth Street, New York, New York, for additional information.

(Continued on page 946)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Wanted Continued)

CHEMIST and BIOCHEMIST, Ph.D., Major Organic. Fifteen years' of research in synthetic organic, enzymes, proteins, carbohydrates, chemistry and physiology of bacteria, mechanism of drug action, immunochemistry. Forty publications, patents. Also several years' research in Europe. Now engaged in biochemical research in a large Eastern University. Desires a change to a responsible position with a progressive group. Imaginative, resourceful. Age 45. Gentile. Please give details in first letter.
Box 41-T-5, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHER desires to obtain position teaching chemistry only. Nine years' successful experience teaching general, qualitative and organic in college and engineering school. Now teaching chemistry and other sciences. Present position permanent. Would be pleased to have opportunity to do research while teaching. Good recommendations. Ph.D. 1935. Major, organic; minor, general chemistry. Good background in other sciences. Publications. Membership: Sigma Xi, Phi Lambda Upsilon. Protestant, family.
Box 46-T-5, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL RESEARCH, development position wanted by Ph.D., physical chemistry, 1941 Doctoral research in precision calorimetry. Publications. Year experience in plastics. Phi Beta Kappa, Sigma Xi. Age 25. Married. 3-A draft classification. Willing locate anywhere.
Box 54-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Teaching and 3 years' industrial research and development experience (pharmaceuticals), desires permanent position in the East. Employed but available within reasonable notice.
Box 16-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, BIOCHEMIST, M.A., Sc.D., assistant professor of biochemistry, now employed, wishes research, teaching, or responsible industrial position, reasonably permanent. 10 years of laboratory research and teaching in biochemistry, nutrition. 37 publications. Married, age 36. Status 3-A. Member four national professional societies.
Box 26-T-6, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, university graduate, twenty years excellent record in research, development, service and sales; publications, patents, sales and advertising literature, new products and new uses; desires active and responsible position; references from all employers; listed in American Men of Science; 3-A draft classification.
Box 30-T-6, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., desires industrial research, or teaching in institution offering opportunity for research. Doctorate in electrochemistry, strong background in physics. Publication. Sigma Xi, Phi Lambda Upsilon. Now university research associate; available September. Age 28, married, dependents.
Box 41-T-6, Ind. & Eng. Chem., Easton, Pa.

TEACHER, PH.D. Well qualified in physical, analytical, inorganic and industrial chemistry, chemical microscopy, etc. Thirty years' experience, half teaching, half industrial research, consulting, testing. Many publications. Employed. Available summer or fall.
Box 58-T-6, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. 1936, wishes teaching or research position in college or university. Graduate major, biochemistry; minors, general chemistry, bacteriology, physiology. B.S. degree in pharmacy. Five years teaching in medical school. Agr. Exp. Station experience. Publications on metabolism of minerals, and of amino acids, clinical chemistry. Married, age 31. Draft Class 3.
Box 99-T-6, Ind. & Eng. Chem., Easton, Pa.

ORGANIC DEVELOPMENT or elementary laboratory research, from which to advance, desired by unemployed Quaker, 26. Married. 3A. Strong in theoretical organic, inventiveness and business administration. Scholastically high. Untrained in languages, advanced laboratory preparations and analytical. Chemical patent attorney '40-'42. Graduate organic '37-'40.
Box 28-N-7, Ind. & Eng. Chem., Easton, Pa.

TEACHER, RESEARCH worker: Ph.D. Majors: Physical chemistry, chemical engineering. Twelve years' teaching these with inorganic, analytical chemistry, metallurgy, microscopy, etc. Sixteen years' industrial research, consulting, testing. Numerous publications.
Box 31-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, CHEMICAL Engineer. Fully qualified in all phases of refining of edible oils and fats, hydrogenation, fatty acid distillation, synthetic esters, etc. 18 years' experience. Competent to assume full responsibility of production, or to undertake a program of research and development along these lines. Married, Protestant and American citizen.
Box 50-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 1941, leading university. Experienced in organic syntheses, micro-analyses, organo-metallic plastics. Graduate assistantships, one year post-doctorate fellowship, Sigma Xi. Single, age 24, draft 2-A. Available immediately.
Box 51-N-7, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. August, 1942, M.Sc. organic chemistry. Bacteriology minor. Training in organic and biochemical preparations, microanalysis, spectroscopy. Research in human fat and fat chemistry methods. Teaching experience in photography. Age 25, single, Class 2-A. Desire industrial research or development.
Box 52-N-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. B.S. 1939. Draft deferred (4-F). Available immediately. Three years' research and development work on pigments and organic chemicals. Patent. Pilot plant experience. Excellent background in organic synthesis and analysis. Personable, single, age 25. East preferred.
Box 53-N-7, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. 1942. Vitamins and nutrition. Good foundation in organic, physical, and physiology. Research on B complex and protein requirements. Publications. Five years' teaching biochemistry, general and physical chemistry. Desires research or teaching.
Box 63-N-7, Ind. & Eng. Chem., Easton, Pa.

MIDWEST UNIVERSITY instructor. Also decade of college experience (Dept. head). Specialty, Organic. M.Sc. from eastern university; minor, physical. Trained in chemical microscopy; experienced with pre-med students; some biochemical background; year of recent graduate study; published articles. Available September for research, industry, teaching.
Box 66-N-7 Ind. & Eng. Chem., Easton, Pa.

ASSISTANT PROFESSORSHIP in organic or physical desired by young chemist, Ph.D. Six years' successful experience in direction of large industrial research laboratory. Prefer academic position combining teaching and research. Proven background in research direction, lecturing aptitude. Married.
Box 11-T-7, Ind. & Eng. Chem., Easton, Pa.

EMPLOYERS LOOKING for a young chemical engineer B.S., Ch.E., 1942, who is industrious, adaptable, conscientious, cooperative, and anxious to learn? Am single, 22, temporary 2-B, high scholastic record, good appearance, desire position in vital defense industry. Location immaterial, available immediately.
Box 12-T-7, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL PHYSICIST, M.E. and Ph.D. with varied commercial and research achievements including items now in production. Desires responsible position requiring initiative, imagination, and sound judgment. Will solve annoying problems incident to the application of new materials or devices in the war effort.
Box 16-T-7, Ind. & Eng. Chem., Easton, Pa.

YOUNG RESEARCH chemist, honor graduate of midwestern university; native of Poland, first papers, final papers soon; two years' varied industrial (plastics and inorganic) experience, some teaching; English, German, French perfect; draft deferred.
Box 23-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. in chemistry. Minor in chemical engineering. 1941 graduate from A.C.S. accredited engineering college. Excellent experience in public relations. One year experience in development and research. Prefers job in organic production. Must be in defense. Presently employed, but available after short notice. Single. Willing to travel anywhere. Phi Lambda Upsilon.
Box 24-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D. inorganics and pharmaceuticals, 38 years, married. 12 years' varied experience, research, plant and control. Available now.
Box 25-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, chemist, M.Ch.E., 27, single. Courses in analytic, organic, inorganic, dyes, physics, textile-chemistry, technology, engineering, ESMDT course fuel lubricants. Desire to start as assistant with chance for advancement. Preferably N.Y.C. or vicinity but consider anywhere. Available on short notice.
Box 27-T-7, Ind. & Eng. Chem., Easton, Pa.

PH.D. Twenty years' experience in industrial research and development. Some teaching experience. Wish to return to teaching with opportunity for pure research. Excellent record of applied research in colloid chemistry, nutrition and organic chemistry.
Box 29-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, eleven years' experience including teaching chemical engineering, chemist in control laboratory, pulp research, gas absorption, waste liquor evaporation and combustion and process engineer in munitions plant, desires responsibility and hard work in the West. Age 37, married, two children.
Box 30-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.A., seventeen years' experience; equipment design, plant operation, research director. Experienced with production cyanides, salt, soda ash, potash, salt cake, borax, magnesium metal. Desire executive position production or construction. Boulder City, Nevada.
Box 31-T-7, Ind. & Eng. Chem., Easton, Pa.

FOOD, BIOCHEMIST, now employed, Ph.D., 36 years, 3A draft, Protestant, many publications, industrial, academic, and contact experience. Seeks responsible position in such fields, member many organizations, excellent references.
Box 33-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Texas A & M, 10 years' experience in control, plant, and research laboratories of petroleum refineries. Also 10 years' experience in charge of plant operations including vapor phase cracking and the manufacture of gums, resins, solvents, toluol, benzol, and naphthalene from petroleum oils.
Box 34-T-7, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST. Ph.D., several years' of industrial experience in surface chemistry, electrochemistry, and pigment technology. Desires position more closely related to the war effort. Publications and patents. Draft deferred.
Box 36-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S., 30, married, one child. Organic major; analytical, physical, industrial minors. Eight years' teaching. Last five in State College, research during spare time. Desire employment essential for defense. Available immediately.
Box 37-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S., M.S. 1942. A. C. S. accredited college. Organic and Biochemistry. Some industrial experience. Single. Favorable draft status. Position in essential industry desired. Available immediately.
Box 42-T-7, Ind. & Eng. Chem., Easton, Pa.

COLLEGE-TEACHING. Ph.D. 1935. Employed. Desires change in position where opportunities in teaching and research are available. Prefer analytical or inorganic. Also physical, organic, chemical microscopy, X-ray crystallography and metallurgy. Nine years' teaching experience. Age 37. Family.
Box 43-T-7, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.A., 1940, Biology and Chemistry Major; two years' graduate work in organic chemistry and biochemistry. Synthetic organic work preferred but am willing to try almost any laboratory work. Single, Protestant, age 24. Eastern states preferred but will consider other locations.
Box 45-T-7, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST 6 years' experience in Foods and Vitamin Analysis, Research, Development, Production, consulting; vitamin stability in enriched breads. Desires development or research position in vitamin production. B.S., 1936 University of Chicago; age 27, married, draft deferred.
Box 46-T-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST. M.S. 1940. Unusually thorough training in general inorganic, organic fields. Capable of independent research. Three years of industrial experience. Married, Protestant, 29 years of age, 3-A draft Prefer Southwest or Mountain area, but will consider anything in Western Hemisphere. Available after A. C. S. meeting in Buffalo.
Box 47-T-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, young with mature judgment. Well trained industrially for research, development, or general plant work. Degrees in chemical engineering and chemistry. Desires change to a war industry where his training and abilities could be more fully utilized. A metropolitan area is preferred.
Box 52-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S. Ch.E. 1939 with three years' experience in heavy chemical industry, desires change to defense work. Would prefer design, production, process development or research work connected with either synthetic rubber, magnesium, aircraft or similar defense industry.
Box 53-T-7, Ind. & Eng. Chem., Easton, Pa.

CARBOHYDRATE and MEDICINAL research chemist Ph.D. Age 43. Married. Four years teaching and 15 years in industrial research, developing products from laboratory to large-scale plant. Specialties: Medicinal products, carbohydrates and dextrines, zymochemistry. Experienced in contacting clinicians and supervising clinical tests.
Box 54-T-7, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST Ph.D., successful industrial research, Sigma Xi, Phi Lambda Upsilon, Publications, seeking part-time employment in defense plant or teaching defense courses, Metropolitan New York.
Box 55-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. M.S. Pet. Eng. 1941. 3 yrs. rubber production, 5 yrs. petroleum engineering research. Patents. Desire development or production position in synthetic rubber program. Employed. Age 28. Married. Draft 3-A. Location immaterial.
Box 61-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, YOUNG, M.S. Michigan. Two years' experience, currently employed, draft classification 2-B. Position with professional status desired. Development or control work. Now in East but willing to accept position elsewhere.
Box 69-T-7, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 947)

(Situations Wanted Continued)

CHEMIST, B.S. and M.A. from two middle western state universities. Research in gas-phase catalysis. Work in battery construction and practical electrochemistry. Age 23; 2-B draft classification. Desires position with industry engaged in defense work. Location immaterial. Available Sept. 1.
Box 79-T-7, Ind. & Eng. Chem., Easton, Pa.

RECENT B.A. Physiological chemistry: Well-grounded biochemistry, bio-assays, applied physiology, medical, x-ray technology, bacteriology, chemical microscopy, colloids, etc. Prefer to work, learn pharmaceutical-type laboratory or plant but consider others. Excellent personal references. Immediately available. Age 23. 2-A continued if chemist.
Box 78-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER active member A.I.Ch.E., thoroughly trained and experienced, now employed in administrative and instructional position. Would like industrial position as test engineer or technical assistant to executive. Specialties large scale plant tests, technical reports, economic studies. 3-A draft. Minimum salary considered $450 per month. Location immaterial; domestic or foreign.
Box 81-T-7, Ind. & Eng. Chem., Easton, Pa.

SPECIALIST for TEXTILE, leather and similar fine chemicals. 16 years' experience in development and production of sulfonated oils, anion, non- and cationactive finishes, wetting agents and detergents, starch products, resin finishes, water, flame and crease proofing, synthans, etc., at present employed with a well known concern. Desires responsible position where his broad experience could be utilised.
Box 83-T-7, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Sc.D. Age 33. Married. Nine years' experience in biochemical research and direction, specialising in vitamins. Broad biological training, including bio-assay. Research publications. Employed. Desires new position with active food or pharmaceutical organisation. Draft deferred.
Box 85-T-7, Ind. & Eng. Chem., Easton, Pa.

REGISTERED PATENT agent, 4 years' corporation experience ex parte prosecution, validity, infringement on process, chemical and mechanical cases. Previous experience in industrial chemical research. Presently employed. 3-A draft status. Include approximate starting salary in responding.
Box 87-T-7, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

ASSISTANT PHARMACOLOGIST and chemist. Bio-assays, research, biochemistry, 6 years' experience in medical school and pharmaceutical house, graduate chemistry, 3-A in draft.
Box 10-T-7, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST. Desire chief chemists' position in factory manufacturing food products of superior quality. Experience: 3 years' graduate. 5 years' manufacturing. Diplomatic. Co-operative but expect full say within delegated authority. Married, 2 children, American, Protestant, 30 years, class 3-A. Prefer East or mid-West. Salary range $5000.
Box 17-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S., M.S., 3 yrs. work toward Ph.D. Organic, pharmaceutical, and agricultural biochemistry. Wants position with future in Indiana, Illinois, or western Ohio. Should be connected with war work. Now located in central Indiana. Gentile, 27, draft 3, married. Versatile, adapted to quick training for specific work. Will consider contract effective late this year.
Box 32-T-7, Ind. & Eng. Chem., Easton, Pa.

YOUNG CHEMICAL engineer with master's degree from Harvard graduate school of business administration is interested in position where experience in both administration and chemical plant operation would be used to greatest advantage. No chemical research.
Box 35-T-7, Ind. & Eng. Chem., Easton, Pa.

SCIENTIFIC BOOKMAN-Librarian exceptionally experienced along scientific lines wishes connection.
Box 59-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 12 years' experience organic chemical plant planning, layout, equipment design, piping, specifications, equipment selection, supervising plant operations, etc. Capable taking complete charge of projects, or supervising production. Good practical knowledge of process operations. Desire permanent connection with responsibility. American. Protestant. Married. Age 37.
Box 66-T-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH PHYSICAL chemist Ph.D. leading eastern university securely employed. Desire change to position with better advancement prospects. War work wanted specialised experience in industrial X-ray crystal structure work, publications, Phi Beta Kappa, Sigma Xi, Phi Lambda Epsilon. Age 27, single, dependency, draft deferred.
Box 67-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, age 27. B.S. large midwestern university. 2½ yrs. experience in research, pilot-plant, and production. Desires industrial research or development, preferably in essential defense industry. Mid-west preferred. Draft status 2-B.
Box 71-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 28, B.Ch.E. 1938, M.S. 1939. Unmarried. Two years' experience in petroleum refinery operations, process development and pilot plant work. Thermal alkylation, hydrogenation, polymerisation, motor fuel. Middle West or North Eastern location preferred. 2-B draft. Only defense work considered.
Box 77-T-7, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST B.S. Chem. graduate work. 8 years' experience, production, research, control and development. Desires position with progressive Drug or Cosmetic house. Capable assuming duties of Production Manager, charge of laboratory development.
Box 84-T-7, Ind. & Eng. Chem., Easton, Pa.

TEACHING POSITION wanted, College or University. B.S. in Chemistry, also major in Biological Sciences, Masters degree in Education, University of Pittsburgh. Experience: Two years' teaching, seven years in industrial laboratory. Married, 32 years of age, draft status, 3-A.
Box 86-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S., 12 years' practical experience in the analysis of foods, fuels and lubricants, metals, paint, detergents, rubber, and general chemical analyses. Experience in research and metallography. Specialist in ASTM and Federal specifications tests. Age 35, draft 3-A.
Box 88-T-7, Ind. & Eng. Chem., Easton, Pa.

composed of two balanced tandem decks, suspended from the dryer framework by inclined flexible hangers and actuated in opposition through flexible pitmans from a common eccentric shaft. Moisture is removed by passing hot furnace gases, tempered with atmospheric air, downward through the bed of material as it travels along the screen. *Bulletin 242 CEN.* McNALLY PITTSBURGH MFG. CORP., 307 North Michigan Ave., Chicago, Ill.

High-Speed Steel. A 12-page booklet describes Jessop TCM high-speed steel, with information regarding performance and typical applications. *Booklet CEN.* JESSOP STEEL CO., 534 Green St., Washington, Penna.

Hypochlorite Producing Unit. This bulletin covers an electrolytic unit for inexpensive production of hypochlorite. It is offered in two models. Model I-V, with a single cell, is designed to produce 15 gallons of hypochlorite per hour (0.5 per cent NaOCl). Model H-V operates with two cells to deliver 30 gallons of hypochlorite per hour. *Make Your Own. Hypochlorite Bulletin CEN.* VALHALLA CO., 231 South LaSalle St., Chicago, Ill.

Laboratory Apparatus. A 16-page bulletin brings the reader up to date on new developments in this line of laboratory apparatus. The bulletin illustrates a wide variety of equipment useful for many different laboratory jobs. *Bulletin 542 CEN.* ARTHUR S. LaPINE AND CO., 121 West Hubbard St., Chicago, Ill.

Liquid Density Recorders. This instrument offers the advantage of continuous, direct measurement of liquid flow. If automatic control of density is required, the equipment may be hooked up with a density controller. Charts are available reading to small units and may be had in specific gravity, Baumé, Brix, or other recognized scales. *Bulletin A-264 CEN.* THE FOXBORO CO., Foxboro, Mass.

Liquid Processing Equipment. This line of mixers, filters, and portable tanks is described, with all recent improvements listed. The bulletin also carries descriptions of asbestos filter disks, vacuum bottle fillers, screw capping machines, and label pasting machines. *Catalog 941 CEN.* ALSOP ENGINEERING CORP., Milldale, Conn.

Manganese Steel for Crusher, Grinding Mill, and Pulverizer Parts. This well-illustrated bulletin pictures a wide variety of parts for grinders and pulverizers. Charts and dimensions are given in many cases. *Bulletin 642-C CEN.* AMERICAN MANGANESE STEEL DIV., AMERICAN BRAKE SHOE & FOUNDRY CO., 389 East 14th St., Chicago Heights, Ill.

Measuring and Control Instruments. In this 16-page bulletin the authors describe and illustrate unit construction of temperature controllers and discuss an electronic principle for effecting control without contact between the measuring and control functions of the instrument.

For Sale

CRESYLIC ACID

William D. Neuberg Company

420 Lexington Ave. New York, N. Y.

Telephone LE 2-3324

FOR SALE: Drum, revolving steel, 18 feet long, 3 feet 10 inches outside diameter, 3" refractory lining (can be removed). Variable speed drive, drum speed 4 to 14 R.P.M. Automatic feed. Used few hours only. Price $2250.00. Mounted on steel skids. Washburn & Granger, Inc., 53 Park Place, New York.

FOR SALE: Jourl. Amer. Chem. Soc. bound 1910–1913, unbound 1914–1941; Ind. & Eng. Chem., bound 1910–1913, unbound 1914–1941; Analytical edition unbound 1929–1941; Chem. Abstracts bound 1910–1913, unbound 1914–1941; Canadian Jourl. Research unbound 1929–1941; Canadian Chem. Jourl. unbound 1918–1941. Together or separately. J. W. Shipley, 11050 90th Ave., Edmonton, Alta., Canada.

FOR SALE: Chemisches Zentralblatt 1915–23 and 1924 vol. I/II unbound; Zeitschrift fuer Elektrochemie und angewandte physikalische Chemie vol. 35–45 (1929–1939) unbound. Box 21–T–7, Ind. & Eng. Chem., Easton, Pa.

OFFERED for SALE to highest bid if satisfactory: 1. Frits Ullmann: Ensyklopaedie der technischen Chemie. Second edition, Berlin, Wien 1928–1932. Vol. I–IX and index. 2. Berl & Lunge: Chemisch-technische Untersuchungsmethoden. Eighth edition, Berlin 1931–1934. Vol. I–V, 6 volumes. Box 22–T–7, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Glassware from a steel laboratory largely Pyrex, cost over one hundred dollars, will sell for fifty. Seen by appointment. M. L. Rogers, Earlville, N. Y.

WE OFFER: 100 lbs. Sodium Cacodylate, 25 lbs. Iron Cacodylate, 25 lbs. Cacodylic Acid; also Cystine, Calcium Levulinate, Creatine, Digitonin, Methionine, Proline, Phloridsin-d-Ribose; Acids, Barbituric, Galacturonic, Glutamic, Levulinic, Sebacic; Caesium Chloride. Box 48–T–7, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Tungsten Metal Cubes 99.99% pure, Vanadium Metal Lumps 96% pure; Boron, Caesium, Gallium, Germanium, Indium, Titanium, Uranium, Zirconium Metals in quantity; Iron Carbonyl, Hafnium Oxide, Yttrium Oxide, Naphthoresorcinol. Box 49–T–7, Ind. & Eng. Chem., Easton, Pa.

FOR SALE complete or half interest: Active commercial laboratory business long successful in industrial area. Present activities: chiefly metallurgical and inorganic analysis. Opportunity for expansion into agricultural work, for which also equipped. Box 51–T–7, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal Royal Society Arts 1910 to 1939, Journal Society Chemical Industry 1905 to 1938, Beilstein, Handbuch organischen Chemie 3 Ed. cplt. Schultz, Farbstofftabellen, 7 Ed. cplt. Zeitschrift anorganische Chemie vols. 38 to 87. 118. 120 to 138. 217 to 235. Box 60–T–7, Ind. & Eng. Chem., Easton, Pa.

FOR SALE used equipment does not require priority. We are constantly offering fully guaranteed standard laboratory equipment. Immediate delivery. Priced in strict conformance with government regulations. Now available Spencer and other types of microscopes, Microscopic accessories, Schmidt & Haensch Saccharimeters double wedge for tubes to 400 mm., Zeiss Sugar Refractometers, Universal Viscosimeter, Analytical Balances, Torsion and Pulp scales, Centrifuges, Ovens, Incubators, Mullen Jumbo tester, Perkins Tensile tester, Suter Tensile Tester, Scott Testers, Hydraulic presses, Hanovia Quarts Lamps, B & L Duboscq Colorimeters, meters, bridges, sterilising autoclaves, water stills, and hundreds of other standard laboratory instruments too numerous to mention. Write us your needs. We will quote or search for you the equipment needed. We purchase laboratory equipment for cash. The Laboratory Exchange, 24 East 21st Street, New York City.

FOR SALE: New laboratory, drying ovens, three sizes single wall with Thermostatic Controls, new laboratory hydraulic presses, 6 x 6 self contained, with 10 ton gauge, electric hot plates, test molds, 3 heat laboratory hot plates, 7" and 8" heavy duty, disc shaped cast top for distillations, extractions, etc., new $8.75 and $10.75 available for immediate delivery. Subject to prior sale. Write for full information. The Laboratory Exchange 24 East 21st Street, New York City.

FOR SALE: While they last, balance, pulp, for use in weighing ores, pulp, sugar, etc., a very fine general laboratory balance to use in between an analytical and course, 150 gr. capacity, 1 mg. sensitivity, fine polished mahogany case with glass sides, sliding counterpoised door, leveling screws, drawer for weight ready for immediate delivery. Specially priced at $27.50 subject to prior sale. Order immediately if you need these as we are selling these very rapidly. These are unused purchased from a Government Department as surplus to their needs many months ago. F. O. B., N. Y. C. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Rights to patented process for converting an abundant raw material into excellent synthetic waxes. Raw material not restricted by priorities regulations. Box 72–T–7, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Chemical Abstracts, single issues June 20, 1924, Aug. 20, 1924, Sept. 20, 1925. Also 1926 except December issues; 1927 except for Jan. and Apr. 20 issues; and 1928, 1929, 1930, 1931, 1932 and 1933 complete. Transactions American Electrochemical Society, Vols. 7–14 inclusive; 49–62 inclusive; 67–70 inclusive and 73–74 inclusive. Herman H. Kahlenberg, Box 1888, Sarasota, Fla.

WANTED TO purchase. Copy of "Methods of the Chemists of the United States Steel Corporation for the Sampling and Analysis of Gases" issued by the Carnegie-Illinois Steel Corporation. State price and condition. Box 13–N–7, Ind. & Eng. Chem., Easton, Pa.

WANTED: Water bath and shaking mechanism for Barcroft Warburg respirometer, with or without manometers. Department of Bacteriology, New York University College of Medicine, 477 1st Ave., N. Y. C.

WANTED to BUY: Burgess-Parr or Amenco high pressure hydrogenation equipment with shaker mechanism also Polarimeter, electrically heated Barnstead water still, fractional distillation column for vacuum. Box 38–T–7, Ind. & Eng. Chem., Easton, Pa.

WANTED: AMERICAN Chemical Society Publications especially before 1915 and 1934 to date. Decennial Indexes of Chemical Abstracts wanted. P. Borgstrom, 1506—23rd St., S. E., Washington, D. C.

WANTED: BEILSTEIN, Handbuch Der Organischen Chemie, 4th ed., complete set. Will pay top price. Box 44–T–7, Ind. & Eng. Chem., Easton, Pa.

WANTED: 250 lbs. Sodium Cacodylate, 1000 lbs. Sodium Glutamate, 20 lbs. Asparagine; also wanted Edestine, Xylose, Orcinol, Thallium Sulfate, Theophyllin, Histamine di phosphate, Histidine mono HCL. Box 50–T–7, Ind. & Eng. Chem., Easton, Pa.

WANTED to BUY: We are urgently in need of additional laboratory equipment. We have a tremendous demand for used laboratory equipment. Instruments, accessories and supplies. Offer us your surplus equipment now while we have such a splendid market and government regulations permit us to pay a fair percentage of their original cost. All purchases are on a cash basis immediately upon arrival. We need hundreds of microscopes, Abbe refractometers, polarimeters, Vacuum pumps, lenses, microscopic accessories, vacuum ovens, autoclaves, analytical balances, testing machines, equipment and instruments for metallurgical testing, small lathes and tool room machines, cameras, binoculars, Greenough microscopes, comparators, dividing machines, in fact everything used in testing laboratories, research, etc. We are America's largest purchasers of used equipment. Write, wire or telephone us your offerings for immediate purchase. The Laboratory Exchange, 24 E. 21st St., N. Y. C. Phone Algonquin 4–3879.

WANTED: "Berichte der Deutschen Chemischen Gesellschaft": Vol. 2 (1869) paying $30, Vol. 3 (1870) $25, Vol. 5 (1872) $15, Vol. 6 (1873) $13, "Journal of Physical Chemistry": Vol. 1 paying $25, Vol. 5, $15, Vol. 6, $12. Dr. G. H. Fransius, 201 East 82nd Street, New York, N. Y.

WILL PURCHASE new or used spray drying equipment. Or will consider arrangement for drying of our material. Box 82–T–7, Ind. & Eng. Chem., Easton, Pa.

Remote controllers, combustion safeguard equipment, and other instruments are covered. The bulletin gives prices and lists numbers of catalog selections. *Bulletin Z6000 CEN.* WHEELCO INSTRUMENTS Co., Harrison and Peoria Sts., Chicago, Ill.

Metallurgical Laboratories. Laboratory aids for use in iron and steel laboratories and suggestions of apparatus and chemicals for analysis of iron, steel, and nonferrous metals are described in a 4-page, 2-color folder and a 9-page mimeographed list. *Bulletin 75 and List MET CEN.* CENTRAL SCIENTIFIC Co., 1700 Irving Park Road, Chicago, Ill.

Mixing Operations. A new type of mixing operations data sheet provides a simplified and accurate breakdown of the specifications of the tank in which the mixer is to be used; available electrical current supply; type of motor required and plant conditions under which it must be used; detailed analyses of the mixing operation, mixing cycle, and the materials to be mixed. *Confidential Mixing Operations Data Sheet CEN.* MIXING EQUIPMENT Co., INC., Rochester, N. Y.

Oil or Water Lubricated Pumps. In addition to descriptive data on this line of pumps, cut-section two-color illustrations show working characteristics. The vertical hollow-shaft type of construction is said to offer an advantage in the positioning and lubrication of pump head bearings. The bulletin carries a series of engineering tables that will be of importance to any engineer dealing with pumping problems. *Catalog 127A CEN.* PEERLESS PUMP DIV., FOOD MACHINERY CORP., 217 West Julian St., San Jose, Calif.

Pump Data Sheets. A set of data sheets covers selection, installation, operation, and maintenance of industrial pumps. The range of data sheets includes some of a more elementary character designed to be of assistance to new and inexperienced employees. The file containing these data sheets also carries an 18-page book entitled "Pump Fundamentals". *Pump Data Sheets CEN.* GOULDS PUMPS, INC., Seneca Falls, N. Y.

Research Assistance. Two bulletins describe the services and chemicals offered by this company's Manufacturing Division and the functioning of the Research and Consulting Division. *Services and Chemicals* and *How the Independent Chemist Can Help You Bulletins CEN.* EDWAL LABORATORIES, INC., 732 Federal St., Chicago, Ill.

VOLUME 20 AUGUST 10, 1942 NUMBER 15

On This We Build

The Foundations of the Chemical Industry in Western New York

FREDERICK L. KOETHEN
American Lubricants, Inc., Buffalo, N. Y.

THE area surrounding Buffalo, scene of the next national meeting of the AMERICAN CHEMICAL SOCIETY, September 7 to 11, 1942, has a very extensive and well-established chemical industry, producing many unusual products and having to its credit many "firsts" in manufacture. This Niagara Frontier is one of the Nation's important munitions-producing centers, the products of which include not only Cobras and Warhawks but many fundamental materials upon which most of the other industries of the country depend, such as ferroalloys, abrasives, chlorine, reclaimed rubber, and a myriad of special chemicals.

Such an industry did not develop overnight. The circumstances and economic causes which form the background of this development constitute an illuminating story of human progress.

It is interesting to picture the eastern part of our country as it was before the white man started to change it. The most noticeable feature was that trees covered it so thickly that long journeys on land were very difficult. To build a mile of road was a major logging operation. Traffic moved by water. From the time of the earliest trapper and voyageur, the Niagara River was of great importance because it was the cheapest and easiest route to the interior of the continent. North America in those days was a huge treasure sack with only one opening—through the St. Lawrence and the Great Lakes. The Mississippi route was not attractive because of tropical diseases and hostile Indians. All other routes to the interior passed over thickly wooded mountains.

The route up the St. Lawrence or the Hudson-Mohawk-Oswego Rivers was the only one that provided water travel nearly all the way. The portage at Niagara, difficult though it seemed, was very easy compared with the Cumberland Gap or the Allegheny Mountains between the Juniata and the Conemaugh. Up the Niagara came the voyageurs who traded furs and sugar between New Orleans and Montreal. This was the route of Rogers in his search for the Northwest Passage. The Niagara portage was an important bone of contention in the French and Indian War between Britain and France. After the American Revolution, Britain held onto the Niagara portage by every subterfuge and the ill feeling brought about by this holdover period was a minor but contributory cause of the War of 1812. The ownership of the land settled, the village of Lewiston, N. Y., became a thriving and important freight-handling port and continued to be for many years until the coming of a new era snuffed out this traffic completely.

Clinton's Big Ditch

Many events which greatly change the course of human lives may be properly described as acts of God, but the most important date in the history of western New York (except 1492 and 1776) was made significant by the actions of a group of men headed by De Witt Clinton. In 1825 the Erie Canal was completed to Buffalo from the Hudson, a project which made an enormous reduction in freight rates between the seaboard and the interior of the continent. This resulted in the growth of a chain of prosperous cities across New York State and enabled New York City completely to outdistance her commercial rivals, Philadelphia and Baltimore. The Conestoga wagon could not compete with the canal boat. So serious was the effect on Philadelphia that a near panic ensued, and later the Pennsylvania Portage Railroad was organized as a public project. Philadelphians subscribed to the stock as a patriotic duty in the hope of bringing back the trade.

Evidence of the great influence which the Erie Canal had on the prosperity of New York is the story, told and retold in many different ways during the middle of the last century, that if anyone shouted "low bridge" in any gathering of wealthy and prominent people in New York City more than half of the men and some of the women would duck their heads, indicating their humble beginning on canal boats. Chester A. Arthur, 21st President of the United States, is a prominent example of a man who had made his start as a mule driver on Clinton's Big Ditch.

The coming of the railroad in 1835 did not affect this situation as much as would be supposed because people at first thought of the railroad as too expensive for freight, just as we think of the airplane today.

Such were the events which caused large numbers of settlers to come to western New York. Those not engaged in transportation busied themselves with clearing the land and farming. Certain primitive industries developed almost at once. Associated with the clearing of the land was the leaching of potash from the ashes of the ever-obstructing trees. A central leaching plant operating on ashes bought from the settlers was probably the first chemical industry in this area. From it pearl ash was shipped to the seaboard. Sawmills and gristmills operated by small water wheels, lime-burning, tanning, and brewing industries were also established. Natural cement rock was discovered at Akron, N. Y., and quarried as early as 1839, and the burning of plaster of Paris was begun the next year. Landreth's iron foundry, the blowers of which were operated by Niagara Rapids power, was established in 1836. Pratt and Letchworth in 1840 built in Buffalo the first iron rolling mill in the area. Both these plants operated on pig iron brought from the Adirondacks.

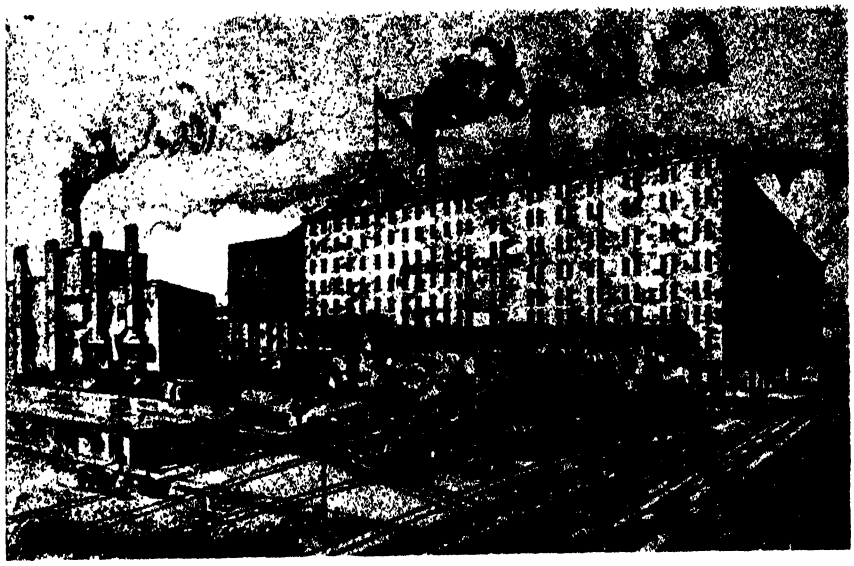

Figure 1. American Glucose plant in 1888

In 1857 Henry Dopp began the production of soapmakers' machinery. The fame of his cast iron kettles soon spread to the entire country. This same establishment, now the Sowers Manufacturing Co., today operates a business of international scope. Other makers of chemical engineering equipment have developed here—Buffalo Forge, 1878, Bell Iron Works, Buffalo Foundry and Machine, Niagara Blower, Spencer Lens, Taber, Lobee and Buffalo Pumps, Crandall Can Fillers, Linde Air liquid air machines, Ross heaters, Buffalo Wire Works (screens), and refractories by Carborundum, Lapp, Exolon, General Abrasives, and Norton.

When patent white flour became available to the civilized world as the height of luxury and good taste, all the first roller mills which made it and which pushed the buhrstone mills into the discard were made in Buffalo by the John T. Noye Co., owners of the patent. Later, when this same white flour fell into disrepute with dieticians, a Buffalo firm took the lead in distributing the vitamins which are now added to flour. More flour is milled in Buffalo than in any other city in the world.

Corn Sugar

In 1871 America's first plant for making glucose and corn sirup, the Fox and Williams Grape Sugar Co., later the American Glucose Co. (Figure 1), was started in Buffalo. The previous supply had all been imported from Germany. Under the leadership of Cicero J. Hamlin from 1875 to 1895, the plant prospered and became the forerunner of a large American industry. Other plants built later followed the movement of the corn belt and now carry on under the name of Corn Products Refining Co.

Aniline Dyes

The first successful aniline dye works in America was started in Buffalo in 1879 by Jacob Schoellkopf, who previously had established tanneries in Buffalo and who later became well known as the business head of the Niagara power industry. The dye factory had a hard struggle against German competition for many years but managed to hold on until World War I when its success became assured. It is now the National Aniline Division of the Allied Chemical and Dye Corp.

Methanol and Formaldehyde

The destructive distillation of wood in cast iron retorts to produce by-products was carried on at a very early date in the southern tier of New York State counties, and after 1880 the crude spirits were sent to Buffalo for refining by E. B. Stevens acting as the Buffalo Alcholine Works. In 1892 Mr. Stevens discovered an improved process for distillation in the presence of added water vapor. This enabled him to reduce the amount of acetone and other impurities to a very low figure, thus making a purer methanol than any commercial product previously possible. This was exhibited at Chicago in 1893 and christened "Columbian Spirits", a name which soon became well known.

What was probably the first formaldehyde made commercially in the United States was produced by Pierce and Stevens in 1901. This department was sold out to Heyden Chemical in 1903.

These are only a few examples of the steps by which the industries of western

Figure 2. Upper Rapids, Niagara River, in 1881. Joncaire's first mill, 1757, and all succeeding mills until 1875 used water from the Upper Rapids. The photograph shows the paddle wheel era at its height, viewed from Bath (now Green) Island. The buildings are: (1) Cataract Hotel power laundry, (2) International Hotel stables, (3) Clark's furniture factory, (4) Phillip's planing mill, (5) Joe George's planing mill, (6) Burdick's machine shop, later Philpott & Leuppie, (7) Miss Woods' Variety Store, (8) Landreth's foundry, and (9) Cascade House, near the entrance to Prospect Park.

A.

New York developed. Before the advent of Niagara electric power, Buffalo had become a large thriving city serving as the center of an active manufacturing district. The reservoir of skilled workmen, financial and managing ability thus built up helped in the utilization of Niagara power.

The Electrochemical Period

The development of alternating-current electric power at Niagara Falls in 1895 was an event of far-reaching importance. It was the first large-scale use of water to develop alternating-current electricity, and it showed the way which all large water power plants since have followed. Never before had such a vast amount of power been available in any one spot in the entire world or so cheaply. Never before had any large amount of power been in a form which could be so easily transported, subdivided, and turned on or off.

Paddle Wheels

Mills of various kinds had been driven by Niagara water power for many years, starting with Joncaire's original sawmill on the Upper Rapids in 1757.

Each of the early mills had to straddle its water wheel. Since the power could not be transported any distance, the number of mills was limited to those which could find a place at the water's edge. All the mills which derived power from Niagara prior to 1875 were simple paddle wheels utilizing only a few feet of head on the Upper Rapids. As the number of

Figure 3. Gaskill Mill, 1875, also the unused water from Hydraulic Canal. View from Canadian side.

mills increased, a millrace parallel with the upper river was built extending down to Prospect Point. The various mills took water from this race and discharged into the river above the Falls. The last water wheel on the raceway operated an elevator to take tourists down to the foot of the Falls.

When the Niagara State Reservation was set up in 1883, all these unsightly mills were purchased and torn down. Figure 2 shows this milling district in 1881.

Low-Pressure Turbines

Construction of the present Hydraulic Canal was started in 1852 and completed in 1861, but no use of the water was made until 1875 when the Gaskill Flour Mill was built (Figure 3). Others followed, mostly flour mills and paper mills, until by 1885 practically all the available space near the mouth of the power canal was occupied, thus preventing further growth. Until a more satisfactory means of transmitting power than by shafts, belts, or ropes was devised, a big waterfall had no advantage over a smaller one. Figure 4, taken in 1895, shows this stage in water power history at its peak.

A 250-horsepower electric generator, operating 16 arc lights, and a silver-plating plant were installed in 1881 in the Quigley Mill by Brush. This was direct current, used within a very short radius of the generator. Not all the necessary devices for using alternating current were available until 1888. Edison's bipolar dynamo was ready in 1878, Brush's compound wound generator in 1881, Stanley's transformer in 1886, and Tesla's induction motor in 1888.

Alternating Current

The first commercial alternating-current electric installation was made in Adam Meldrum and Anderson's store in Buffalo in 1886 for lighting purposes. The Niagara Falls Power Co.'s first plant, located about a mile above the Falls and discharging its waste water into a long tunnel under the city, was completed and started generating 15,000 alternating-current horsepower in 1895. Its success astounded the world and made power plant history. It inaugurated a new era in which water power units could be as large as required. The story of this power plant is ably told in two large volumes by

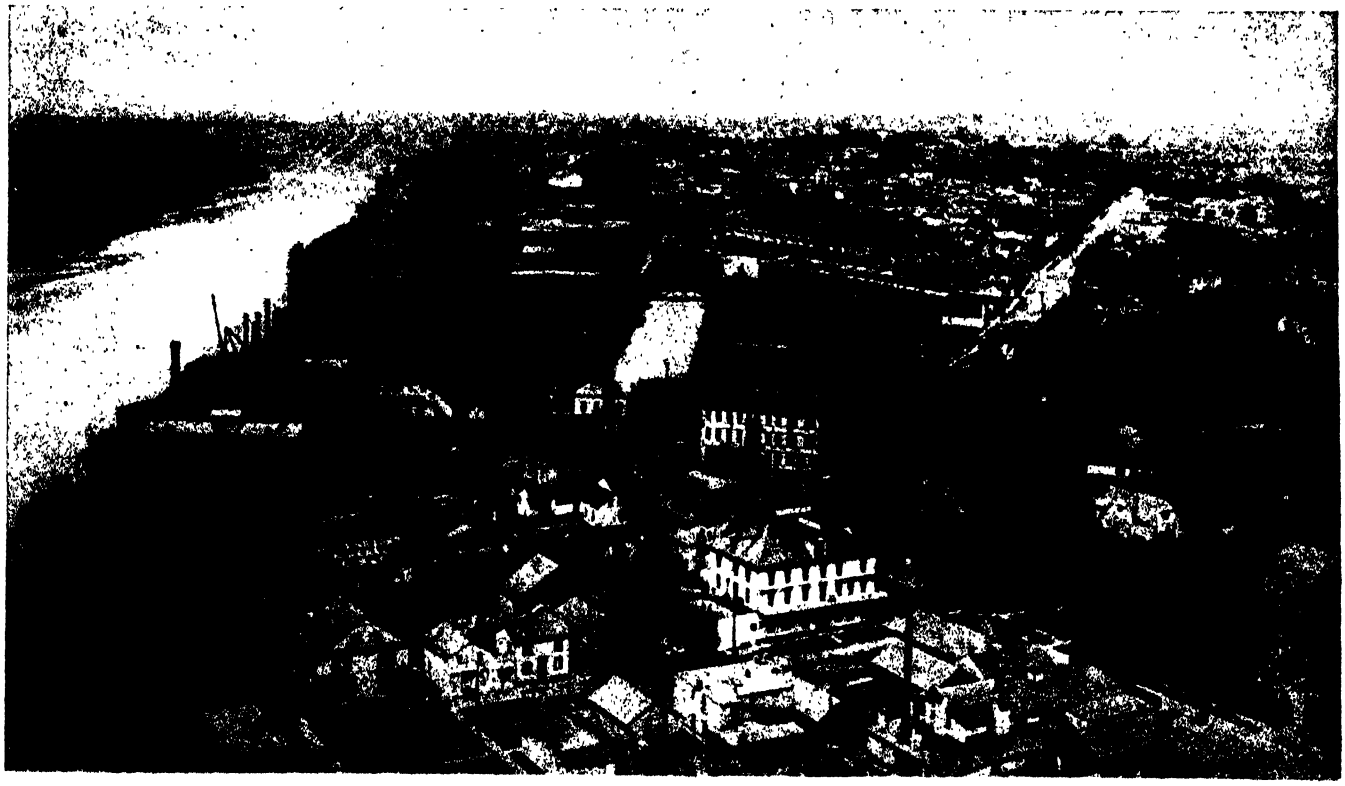

Figure 4. Niagara's lower milling district in 1895

Figure 5. Cutting the wheel pit at Niagara's first alternating-current plant

Edward Dean Adams. Figure 5 gives an idea of the difficulties of constructing this plant, now named the "Edward Dean Adams Plant".

The Hydraulic Power Co. followed shortly afterwards with a large alternating-current installation at the end of the Hydraulic Canal. A waiting list of various new electrochemical processes which had been invented the previous decade were thus enabled to move forward in a big way because for the first time electric power was available in large blocks at low rates.

The first power used from the Adams plant was on August 26, 1895, for the manufacture of aluminum metal by a process invented in 1886 by Charles M. Hall. Edward G. Acheson became a close second with his Carborundum process, invented in 1891 in Monongahela City, Penna. The third customer, Acetylene Light and Mfg Co. (later Union Carbide Co.) manufactured calcium carbide invented in 1892 by Thomas L. Willson at Spray, N. C.

The electrolytic alkali industry in this area started in December 1896 when the Mathieson Alkali Works began operation of the Castner rocking mercury cathode cell, on which they had made previous runs at Saltville, Va. The Niagara Electrochemical Co. began operating the Castner cell for making metallic sodium from fused caustic very shortly afterwards, and the Oldbury Chemical Co. brought from England the new process for making phosphorus in an electric furnace.

Each of these plants was the start of a large industry. Not all the new industries found it easy going, however. Some processes failed utterly, some proved to be scientifically possible but unprofitable. The story of these industries which now are gone, including such names as Acker, Bradley and Lovejoy, William T. Love, Pedro Salom, Ozone Vanillin, Electrolytic Iron, etc., is an interesting tale in itself. But most of the plants prospered greatly, many others followed, and Niagara Falls became Electrochemistry's Capital.

Electric Power in Buffalo

Niagara power was first delivered for use in Buffalo in 1896, just as plans for the Pan-American Exposition were being formulated. The Electric Tower covered with electric lights was the sensational feature of this exposition, and for the first time the public became conscious of the possibilities of electricity. The advertising power of the electric current was as great as its mechanical equivalent and a tremendous stimulation of manufacturing resulted.

Buffalo today has many electrothermic and electrolytic processes, but its principal use of Niagara power is to drive innumerable machine tools, presses, and mills. All these machines use the labor of more men per horsepower than do the electrochemical industries, thus making jobs for the population of a large city.

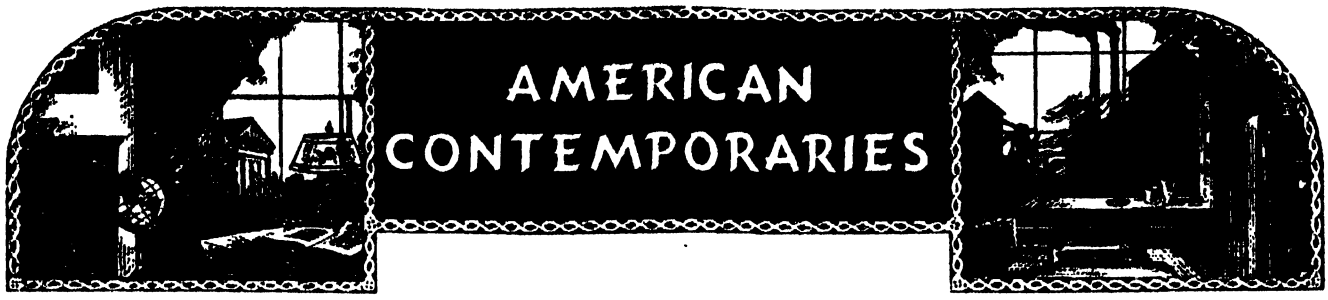
In addition to Niagara power a large quantity of power is generated from steam in Buffalo at the Huntley Station of the Niagara Hudson System. Both plants are tied in with the entire Niagara Hudson System. The Lackawanna plant of the Bethlehem Steel Co. also generates a large amount of power from steam in addition to the hydroelectric power it buys.

The Future

Notwithstanding that the original advantages caused by the canal and cheap power have been more or less leveled off by the railroads and by the building of large hydroelectric plants elsewhere, industry of the Niagara Frontier, and especially the chemical industry, is growing constantly. Its chemical heritage, large supply of skilled workers, and natural advantages enable it to face the future with confidence.

Sets of Abstracts

Sets of abstracts of the Buffalo meeting papers in planographed book form will be supplied by the A. C. S. News Service, 1155 16th St., N. W., Washington, D. C. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors. The abstracts will be mailed as soon as possible after receipt of order, beginning about September 2, and will also be on sale at the Buffalo meeting of the American Chemical Society, September 7 to 11, 1942.



This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.

To those without receipt for divisional dues, who remit with order, $1.00.

To those who fail to enclose remittance with order, necessitating correspondence, $1.25.

To those who require bills to be rendered, $1.50.

E. D. Kingsley

BLANK & STOLLER

LIFE may begin for many people at 40, as Walter Pitkin has it, but for Ned Kingsley the real beginning was postponed until 46. At that age we find him not very well satisfied as silk buyer of McCreery's department store in New York. What happened to him before that time is largely lost in a haze of Yankee reticence which has seldom been penetrated.

At least we know that he was born a New Englander, that his father failed to survive the Civil War, and that Ned had only a sister. Presumably he was somewhat of an amateur athlete, and it is related that his career at Yale ended abruptly after an argument with the elder Camp led to Ned's physical defeat by the great coach. Later he appears in New York's East 23rd Street as the roommate of Francis P. Garvan, then a struggling young attorney who also was later to have profound influence on the development of American chemistry.

But at 46, Ned Kingsley, gifted with imagination and optimism, was a supreme practical psychologist in an age when salesmen were still drummers, a master of meticulous detail, a discontented buyer in a department store, and the uncle of his sister's daughter who held the place in his affections that would have been occupied by children of his own. Each of these attributes was vital to what followed.

Among the observations made by the department store buyer which became important to the chemical company president was the undependability of bleaching processes applied to white goods in the naughty-naughts. Frequently beautiful table cloths and sheets developed unseemly weaknesses and brought troubles to their seller. Often goods had to be rejected for this cause, and the weakness seemed to be inherent in the bleaching process.

Now Caroline, Kingsley's niece, had married a young man from Michigan, Bernard C. Hesse, who belonged to the then strange cult of chemists. Hesse, quite understandably, shared the place of his wife in Kingsley's affections. Indeed, his unique relation with our subject was somewhat that of a son and equally that of a younger brother. Thus it is not strange that the two should have discussed in some detail the problem of the tender napery. Hesse had recently returned from Germany where he beheld and had learned to perform many wonders while chemist in the great Badische Anilin und Soda Fabrik, then one of the greatest of Germany's chemical companies.

Considering the weakness of bleached goods, Hesse concluded its cause to be the action of lime in bleaching powder. In Germany he had seen liquid chlorine, as yet unknown in America, used to produce whiteness without weakening. What happened from that time on is largely the result of the intimate relations between the clever chemist and the supreme salesman, both looking for new fields. It is quite impossible to follow these reactions between two intimates in any detail, but soon we find experiments in progress in a small plant in Germantown looking to the liquefaction of chlorine gas, which incidentally had been imported from Germany in liquid form for the purpose. Failure of any available compressors to handle the job sent Kingsley to Germany to secure some that would function.

That was the beginning of liquid chlorine as an industry in America. The Electro Bleaching Gas Co. was formed after the German machine worked and a small plant was built beside that of the Roberts Chemical Co., makers of chlorine, at Niagara Falls.

Ned Kingsley, armed with a rope end as his principal sales argument, set out to sell the first liquid chlorine to a textile mill. Half of the rope was bleached white with chlorine but was no less strong than the other unbleached half. That seemed convincing enough for any one, but it did not stir New England textile managers out of their accustomed rut. The dapper New Yorker failed to arouse the slightest interest with all his charm and persuasion. After one complete and final rejection, he looked out of the window of a mill in Somersworth, N. H., onto the spring landscape and observed how good it was to be back in New England again. That brought on more talk with the prospect which revealed warm mutual friends. The mill manager, now an interested listener, insisted on hearing again the whole of Kingsley's story. Success of the liquid chlorine venture dated from that repeat performance for troubles with tendering of fabrics ceased at that mill when chlorine replaced bleaching powder in its operations.

That was in 1909. Three years later chlorination of drinking water was tried at Kingsley's urging by his friend, Harry Huy, then superintendent of the water works of Niagara Falls. No better test could have been devised, for Niagara Falls in 1912 held an unenviable record, one of the highest death rates from typhoid fever in the country. When chlorine came in, typhoid went out, and soon Niagara Falls was the envy of other cities and a pattern for them to follow.

The use of chlorine by the German Army with such disastrous effect at Ypres in 1915 had a serious repercussion on the American chlorine industry. It is related that early in 1915 one of the most conservative of American textile mills decided to install a tank of substantial size to store chlorine by the ton and save handling the many cylinders previous practice had required. Everything was progressing well with the enterprise until news of Ypres arrived. That was too much for the plant manager and he, fearing the dread effects of leakage of so much chlorine on a populous countryside, ordered the whole project abandoned.

In the later phenomenal growth of the chlorine industry through widespread use of the yellow gas in innumerable ways, Ned Kingsley played an important part until his retirement a few years ago. Always his winning personality lit up his surroundings. Perhaps because he had no

sons of his own, he has been constantly on the alert to help and encourage young men. That has been an outstanding characteristic of the man. In The Chemists' Club he has found an outlet for his gregarious instincts and scarcely a day passes that his cordial smile is not seen in its precincts. There his convivial spirit revels in pleasant companionship. Now, somewhat quelled by the burden of more than four score years, it still finds solace there among hosts of friends, who respect and love the man whose life began at 46.

D. H. K.

Richard Willstätter

RICHARD WILLSTÄTTER, honorary member of the AMERICAN CHEMICAL SOCIETY, Nobel prize winner for chemistry in 1915, recipient of the Willard Gibbs Medal in 1933 and of an honorary degree from Oxford University, will celebrate his 70th birthday on August 13, 1942. American chemists send best congratulations to this great scientist.

Richard Willstätter was born in Karlsruhe, South Germany. He studied chemistry under Adolf Baeyer in Munich. Very soon he distinguished himself in the field of alkaloids. When 26 years old, he explained the constitution of tropine, atropine, and cocaine, and at 29 carried out the synthesis of tropine, tropilidene, and tropane. The important synthesis of cocaine was made in 1924. Research in the field of natural products has occupied the whole life of this great scientist.

In 1907 the first paper on chlorophyll was published. This work on chlorophyll and its derivatives was distinguished by the Nobel prize in 1915. Those who, like the writer, had the privilege of knowing Willstätter when he carried out his studies with very capable collaborators at the Technical University of Zurich, where he became professor in 1905 succeeding Eugene Bamberger, remember very well not only the enthusiasm of his collaborators, his colleagues, and the younger chemists, but also the great sensation which these studies aroused in the entire scientific world. Without the work of Willstätter and his collaborators in this most important field of chlorophyll and hemin dyestuffs, Hans Fischer, also of Munich, would never have accomplished his excellent work in the synthesis of those extremely important natural products.

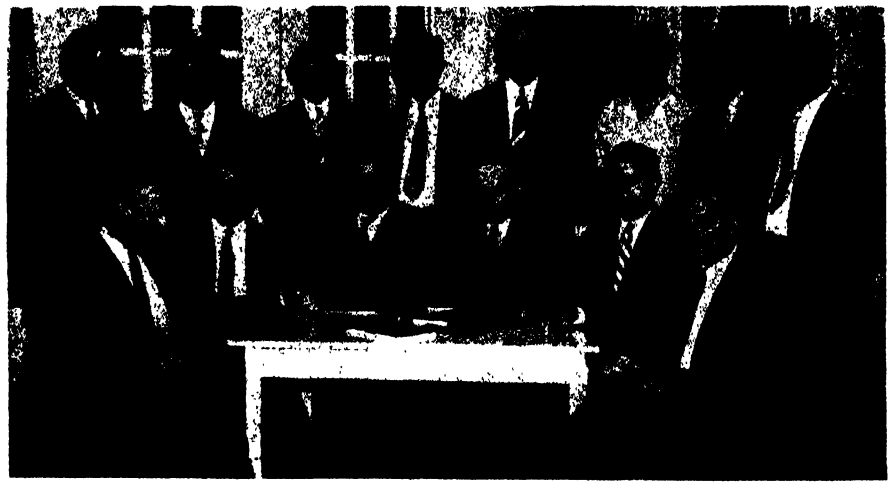
At the same time fundamental studies were carried out with Zechmeister concerning the degradation of cellulose and its conversion into lower carbohydrates. Those studies afterward were continued by Zechmeister alone and led to the isolation of crystallized polyoses, among them crystallized hexaose. The so-called Bergius process for the saccharification of wood cellulose should be named the "Willstätter process". Important studies on ring compounds and fundamental research work in the field of hydrogenation, especially in the presence of oxygen, were also conducted.

Willstätter left Zurich in 1912 and became director of the Kaiser Wilhelm Institute for Chemistry in Berlin. This stay in Berlin lasted until 1915 when he succeeded his great teacher, Adolf Baeyer, in Munich. With Elmer K. Bolton, now chemical director of the du Pont company in Wilmington, and other collaborators, the constitution of the dyestuffs of plants, especially dyestuffs of blossoms and fruits, was explained.

Afterwards Willstätter concentrated the greater part of his research activity on the studies of enzymes. Here great progress was made. The use of hydrates and hydrogels for adsorption purposes opened new ways in the research of enzymes. Willstätter's investigations of fermentation processes brought new light in this very important field.

Besides these fundamental investigations, Willstätter found time to work in the fields of chinones, aniline black, and lignin. New pharmaceuticals, among them the tribromo alcohol and its combination with urea chloride as voluntal, were synthesized.

With Haber new and fundamental viewpoints on the importance of radical chains and the mechanism of organic enzyme processes were developed. Results of these most important investigations in the field of chlorophyll, assimilation, enzymes, and chlorophyllase were published in part in book form with his very gifted collaborator, Stoll.



In Zurich and afterwards in Munich, Willstätter was a most inspiring teacher. Many chemists who have since contributed to science and industry owe important stimulation to Willstätter. Stoll, Isler, Kraut, Kalb, Waldschmidt-Leitz, and, in this country, Roger Adams, E. K. Bolton, Ivan Gubelman, Jean Piccard, and L. Zechmeister were his collaborators.

The events which afterwards led to the present situation in Germany forced Willstätter to give up his academic position in Munich in 1925. With only a few collaborators he continued his scientific work until he was forced to leave Germany and to settle in the southern part of Switzerland.

Great sorrows in the loss of his wife and only son have darkened the life of the great scientist, but he has always kept the torch of science burning. He has given the world the fruits of his genius.

E. BERL
CARNEGIE INSTITUTE OF TECHNOLOGY
PITTSBURGH, PENNA.

Editor's Note. **As CHEMICAL AND ENGINEERING NEWS goes to press, the daily papers announce the death on August 3 of this eminent scientist.**

Mid-West Cooperating Sections

Representatives of the Mid-West Cooperating Sections of the AMERICAN CHEMICAL SOCIETY recently held a meeting at the Meridian Hills Country Club in Indianapolis, Ind., to plan their touring service for 1942–43. *Left to right, first row:* Ed. F. Degering, A. W. Downes, G. L. Corley, T. E. Field, E. T. McBee, R. C. Stillman. *Second row:* W. W. Hilty, W. C. Gangloff, A. N. Stevens, C. L. Shrewsbury, F. D. Martin, J. H. Sample, F. J. Allen, and J. A. Leighty. Officers for the 1942–43 season are secretary, Dr. Degering, and assistant secretaries, C. E. Waring and Dr. Shrewsbury.

On to Buffalo and the 104th A. C. S. Meeting

Toward Self-Sufficiency in Cork[1]

GILES B. COOKE

Research Department, The Crown Cork and Seal Co., Baltimore, Md.

WOODBRIDGE METCALF

Above. This tree yielded 151.5 pounds of stripped corkwood. *Below.* Baled corkwood, from Chico Forestry Station, which was removed in 1940 from trees planted in 1904.

DOMESTIC cork is equal to the Mediterranean product and may be used interchangeably with the imported material, experiments on California cork in the past year show. The project to establish a domestic supply of cork is sponsored by Charles E. McManus, president of The Crown Cork and Seal Co.

Complete and exhaustive tests were conducted on California cork stripped from some of the older cork trees in 1940. Factory grinding tests with 1-ton batches showed a yield of 60 per cent of usable cork. Cork compositions manufactured from this grinding proved equal to similar compositions prepared from imported cork. While preliminary examination had indicated the California cork was of good quality, actual proof that it is the equal of Mediterranean cork has greatly stimulated the rapidly expanding cork-growing program.

In July and August 1941 cork was removed from large trees in Calvaras and Los Angeles counties. From one large tree at Camp Seco, which had been systematically stripped 30 years previously, 330 pounds of second-growth cork were obtained. Almost 2 tons of cork were removed from the trees in these counties. Its general appearance and incomplete tests indicate this cork is of the same quality as that collected in the Sacramento Valley region in 1940.

The planting of young cork trees continued to expand during the past year, and applications for seedlings far outnumbered the available plants. More than 21,000 cork seedlings were set out in California and Arizona, and many acorns were planted in forest ranges to produce trees for 1942.

Because of the progress in California, Mr. McManus decided in 1941 to extend the cork-growing project into other states. A survey of the southern states showed that large healthy cork oak trees were growing in Virginia, North Carolina, South Carolina, Georgia, and Alabama. Agricultural directors and forestry specialists in these states and Florida, Arkansas, Mississippi, Louisiana, and Texas promised cooperation. Already more than 800 young cork trees have been planted in sections of these states, and 1,000 more seedlings that developed late are being held for distribution in October. Many additional cork plants will be available for planting in the South by fall.

Most of the cork seedlings distributed throughout the South grew from acorns from California cork oaks. All available acorns in the South will be collected this year to supplement the California acorns. While cork on the southern oaks appears to be of excellent quality, arrangements have been made with many owners for stripping the trees this summer so that sufficient cork can be obtained to prove this conjecture.

Plans for 1942 include planting over 50,000 trees in California, stripping additional California and southern cork trees, collecting and sprouting many acorns in the South for planting in the spring of

WOODBRIDGE METCALF

Tools which are used in stripping shown with a cork tree growing at McGill Ranch

[1] Dr. Cooke's first article for CHEMICAL AND ENGINEERING NEWS, published March 10, 1941, page 256, dealt with establishment of the cork-growing project in California.

Cork Oak at Ocean View, Va., often called two trees because the trunk is divided into two large sections near the ground

1943, and conducting some very interesting experiments on cork growing.

Enthusiastic support to the domestic cork project has been given by the extension directors and foresters in the cooperating states. These silvicultural specialists have located and photographed cork trees and helped in collecting and sprouting acorns and in distributing and planting seedlings. Their generous aid and splendid cooperation has resulted in much progress in a short time.

Added Feature at Buffalo

THE AMERICAN CHEMICAL SOCIETY has been fortunate to be able to arrange a special symposium for the afternoon of Wednesday, September 9, in connection with the Buffalo meeting of the SOCIETY. The symposium will be devoted to a discussion of synthetic rubber. E. R. Weidlein, technical consultant will speak on "Progress of Synthetic Rubber Production", Albert L. Elder, Materials Division, War Production Board, on "Progress of Butadiene Production", and William H. Dow, president, Dow Chemical Co. on "Progress of Styrene Production".

Fellowships in Medicine and Public Health Offered

THE Commonwealth Fund of New York, 41 East 57th St., New York, N. Y., is offering through the Pan American Sanitary Bureau 15 fellowships for one year's study of public health subjects or postgraduate medical courses. Each fellowship will provide living allowances while the holder is in the United States, travel costs, and tuition.

Conservation of Critical Materials by Use of Alternates[1]

JOHN HORN

Engineering General Department, General Electric Co., Schenectady, N. Y.

FULFILLMENT of the war production program depends in large measure upon industry's ability to find and adopt alternates for a major portion of materials formerly available in ample quantities. It may be interesting to trace the procedure adopted in the General Electric Co.

When conservation orders from Washington are received, they are interpreted first in terms of the company at large and second as they affect particular plants and departments. In cases where the orders involve particular hardships which cannot be overcome immediately, the departmental representatives prepare appeals in accordance with the regulations of the order. The appeals are reviewed from the viewpoint of the common interest of the specific plant and then of the company as a whole.

Our experience has definitely indicated that it is essential both to us and to WPB to handle conservation orders and matters connected with them in a comprehensive fashion.

With materials commonly used throughout the manufacturing units as a whole, the actual conservation effort is usually organized under one or more specialists from the metallurgical staff or under one of the existing metallurgical and material committees which have been operating over a period of years as advisory and standardizing groups. These individuals or committees survey the general situation as regards a particular material or procurable alternate materials and collect all the available information. Tests and experiments are initiated wherever necessary to try out new or modified materials with special emphasis on their adaptability in existing designs with available manufacturing equipment. As soon as the required basic information is obtained, the central coordinator goes over local problems on location, compares notes with his collaborators, and promotes decisions for those changes that hold the best promise. Then follows the initial introduction of the material selected. This sometimes requires execution on a trial basis before a complete switch-over is made.

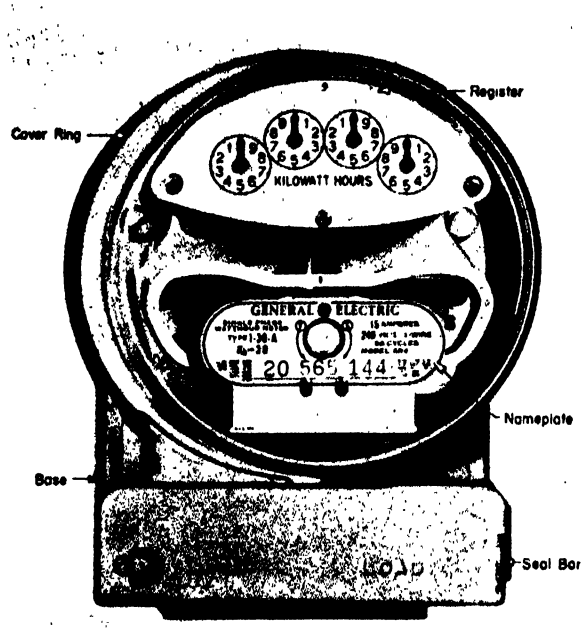
In general, conservation may be resolved into several distinct classes:

1. By straight substitution involving a direct change from one material to another without any significant modifications in design or application.
2. By reducing the quantity of material used. The problem is often largely one of finding new ways of using and fabricating the material in question.
3. By changing to alternates with a consequent need for changes in design and most likely in manufacturing also.

The latest compilation of the relative availability of materials as issued by the Conservation and Substitution Branch of WPB April 17 shows the following 15 materials in the group of some 67 materials which are designated as those most vitally needed for war purposes and not generally available for other needs. These 15 are alloy steel, including a number of the most prominent alloying constituents of same; aluminum, including scrap; chromium; copper, including scrap; magnesium; nickel, including scrap; tin, including tinplate and terneplate; tungsten, including tungsten carbide; formaldehyde; phenol-formaldehyde resins and plastics; shellac; toluene; tung oil; mica splittings; and rubber, including crude, latex, chlorinated, and synthetic.

All these have a conspicuous place on the long list of materials which have been used freely heretofore in G. E. design and production. Some are more easily replaced than others, especially those used for

The author, John Horn, with samples of armature connections made with low-tin content solders and a motor bearing with lead-base babbitt. General Electric is saving about 200,000 pounds of tin a year by such substitutions.



[1] Abstract of paper presented before Northeastern District Meeting, American Institute of Electrical Engineers, Schenectady, N. Y., April 30, 1942.

structural purposes as contrasted with operational functions. The conservation effort has been most effective in eliminating or reducing the consumption of these structural materials.

Aluminum

Use of aluminum in structural parts is largely predicated upon its light weight, its corrosion resistance, and the relative ease with which it can be formed or cast. For most of its structural uses in sheet form or rolled shapes the commonly applicable substitute is steel. For die castings, zinc is taking more and more of aluminum's place although bronze also figures as its substitute.

The largest reduction in the General Electric Co., in the effort to make substitutions for aluminum, covers some 5,000,000 pounds of aluminum which were eliminated in one year's time prior to December 1941 from the production of household refrigerators, a now extinct line. Other yearly reductions in aluminum consumption include 1,300,000 pounds in meter production, 550,000 pounds in industrial control gear, 360,000 pounds in street-lighting equipment, 200,000 pounds in lightning protective devices, and 165,000 pounds in switchgear construction.

In the watthour meter steel replaces punched and stamped aluminum parts for the cover ring, register, seal bar, and bayonet clips. Replacing aluminum are fiber used for the nameplate and die-cast zinc employed for the base.

Tin

Tin comes next to aluminum in respect to quantities consumed for structural use. Most progress has been made in reducing tin consumption in babbitts and solders, although the field of tin-base bronzes offers a promising opportunity for sizeable over-all savings. The principal reason for the less extensive progress with reduction of tin in bronzes appears to be a lack of broad foundry experience with most of the low-tin and tin-free compositions which can be used as alternates. Also the "zinc shakes" encountered in casting zinc-containing alloys figure as obstructions that can be overcome only by improved ventilating provisions which are not always readily installable.

The composition used in the G. E. standard babbitt for rotating apparatus bearings over a period of years is one based largely on tin. The conclusion from investigations and tests to find a lead-base composition to replace this former tin-base alloy is that a lead-base babbitt containing lead, antimony, arsenic, tin, and copper is a satisfactory alternate for use in centrifugally cast sleeve bearings. The resultant saving of tin is about 200,000 pounds a year at the present production rate. Stationary-cast bearings, cast-iron shells with dovetail anchorage, involve a problem of proper pretinning for the use of this same babbitt composition. Active work on this problem and some trial production are in progress.

Solders

For general purpose soldering 40 per cent tin, 60 per cent lead has been the popular composition throughout the company in the past. Some of the alternates such as 20 per cent tin, 1 per cent silver, 79 per cent lead, have been found adoptable with but minor changes in technique, temperatures, and operating schedules. Others, such as the 97.5 per cent lead, 2.5 per cent silver composition, have not proved immediately applicable. To gain further experience, however, a number of compositions between the 20 per cent tin solder down to the no-tin materials have been placed in operation for a final selection of specific varieties to meet the particular requirements of each operation. As an indication of the progress, 10,000 pounds of the 20 per cent tin, 1 per cent silver, 79 per cent lead composition in both rosin-core and solid form have recently been stocked at one of the company's works for replacement of the 40-60 composition.

For electrical joints, particularly those involving reasonably heavy conductors for which 100 per cent tin has been used in the past as a standard to produce strong reliable connections, changes have been made to the use of silver brazing with the exclusion of tin. In the use of soldering pots for hot dipping, good results have been obtained with 90 per cent lead, 10 per cent tin. With but a few exceptions, changes have been made from all other solders of tin contents that exceed the 30 per cent tin limit to low-tin compositions which are being tried out in various uses to establish the lowest limits for regular production.

In soldering leads to high-speed commutators pure tin, however, appears to be the only material that will give safe joints under the temperatures reached in actual operation. Further, there are several sealing operations on two or three different products which we have not as yet been able to produce with solders of less than 60 per cent tin. Wiping of cable joints represents another operation for which a definite alternate for the 40-60 solder used in the past has not yet been found, and indications are that tin solders with less than 38 per cent tin cannot be worked in a practical way to produce reliable nonporous wipes. Certain tinless solders are being explored.

Substitutions that have been made and those that will be made in the very near future account for tin savings of more than 50 per cent of all the tin that would be required if these alternates were not in the picture.

Alloy Steel and Copper

Alloy steel and copper are both very large-usage materials in the company. Alloy steels can hardly be discussed in a general review of substitution of the present character because the varieties are too numerous and any of these may in turn be replaceable by several other compositions.

Wherever copper serves as a conductor it can be replaced in rare instances only. Any conservation effort on copper reduces itself almost entirely to a search for the most economical utilization of the very smallest quantity of copper that will do the job. A good many former applications of copper for nonconductor uses have been taken over by steel, malleable iron, terneplate, brass, bronze, and zinc. There are also a number of applications of copper and copper alloys in connection with transformer, oil circuit bushings, and the like where it is used because of its nonmagnetic properties to avoid stray currents and objectionable local heating. To conserve copper in such uses, parts have been moved far enough away from the electrical conductors to prevent the undesirable effect. In several instances, however, this remedy has proved to increase the size of the complete apparatus to such an extent that the over-all quantity of copper and other critical materials consumed would be increased.

The statement in the foregoing that copper for conducting purposes can be replaced only in rare instances may shortly

need to be modified. Transformers are on order in which 150,000 pounds of silver will be used in place of the copper. The experience with these units and with silver bus bar installations in certain industrial plants may disclose interesting possibilities.

Chromium and Nickel

Chromium and nickel have a special importance in their combination as an electrical resistance material used extensively in control-device resistors and heaters. In some cases where the resistor forms an external part of the device and where sufficient space is available, nichrome wire can be conserved by a change to cast-iron grid resistors. Many applications remain where the resistor or the heating unit forms a compact element which in turn is a component part of a complete assembly. For elements of this nature the search has not yielded a practical alternate material.

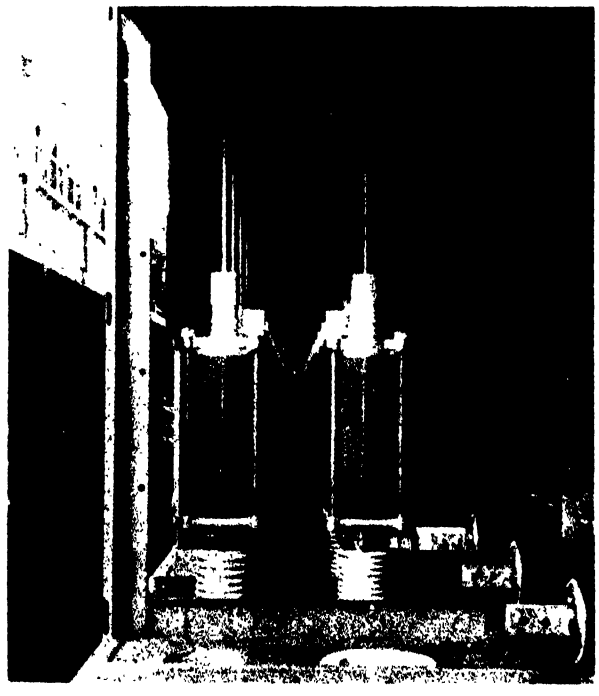
Nonmetals

The nonmetallic materials selected from the WPB grouping of scarce critical materials are all components of electrical insulations used extensively in G. E. products. No substitute has been found for formaldehyde, which is required for the manufacture of coil-treating varnishes and allied materials.

Toluene is an ingredient of many varnishes of fast-drying characteristics serving as stickers, binders, or adhesive agents, for instance in built-up mica, and treating materials. Between 100 and 150 such formulations required toluene prior to 1941, but total consumption is now down to less than 50 per cent of the quantity formerly used. The principal substitute is the petroleum derivative known as Solvesso 1.

Tung oil is also one of the important ingredients in certain insulating varnishes. Oiticica oil, a preferred substitute for tung oil, is also scarce. A number of other oils have also been found practical, and synthetic varnishes which do not require tung oil have been developed. The net reduction in the requirement for tung oil is about 35 per cent.

Shellac



Shellac remains the only known material that forms a satisfactory binder in high-class, built-up mica and in high-voltage insulating cylinders. For the latter, phenolic resins have proved applicable in place of shellac, but with the present shortage of such resins other materials are needed. In a variety of other applications where shellac has formerly been used, synthetic materials are being introduced.

Mica

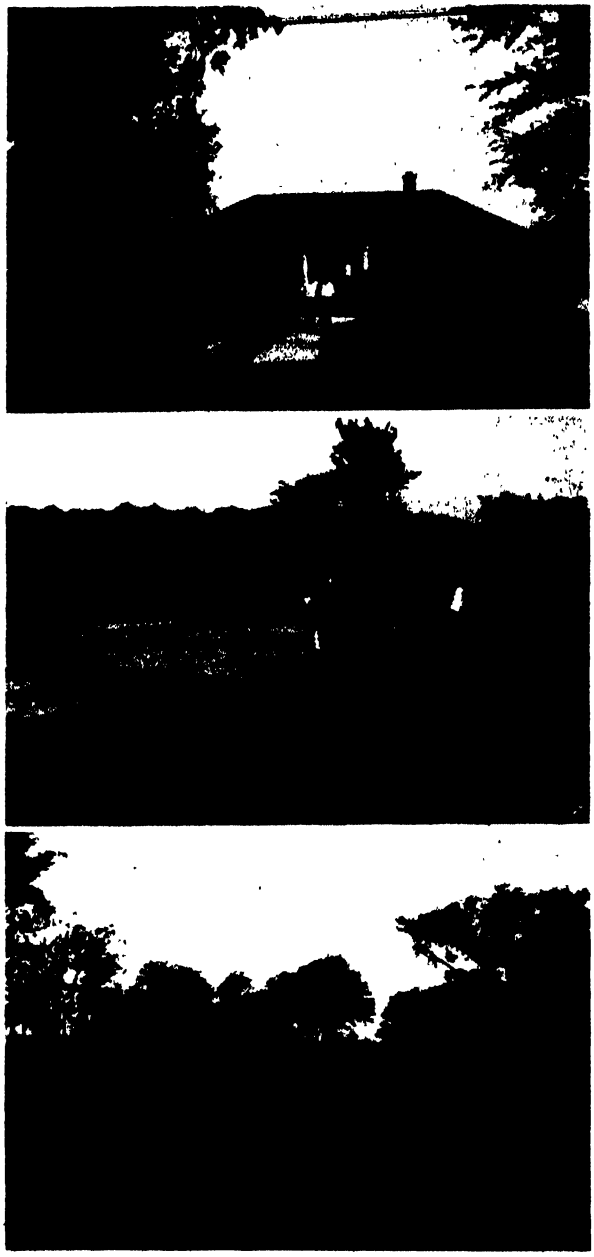
Mica is still an unmatched material for certain insulation uses in electrical apparatus construction where its outstanding characteristics are actually needed. The grades generally suitable are the imported varieties from India and Madagascar, but considerable quantities from deposits in both North and South America are finding use. The principal problem is in obtaining satisfactory machine splittings as compared with the hand-split imported grades. Wherever possible, mica from deposits on the American continent is used to reserve the imported grades for higher requirements. Otherwise, mica is being conserved through use of improved manufacturing methods, both in production and application, and by reducing the thicknesses of mica to the amounts actually needed where formerly greater thicknesses may have been used as an additional safeguard. In one application such a change from 0.03 to 0.02 inch produced a saving of 3,800 pounds a year.

Rubber

The largest usage of rubber in G. E. products is in insulated wires and cables. After much work in recent years a stage has been reached where reclaimed rubber may be applied in practically the same manner as crude rubber for most insulated wire applications. Work is continually being done to facilitate use of the various synthetic grades. The wall thickness of the rubber insulation is decreased wherever possible.

Cast or fabricated steel replacing aluminum alloy for crossheads (top center) of oil circuit breakers like these conserves about 75,000 pounds of aluminum yearly.

Method to Stamp Garment Out of Nylon Fabric Patented



THE process of producing garments from nylon fabric would be speeded and cheapened by a new way of cold-drawing these products, or stamping them out of flat pieces of nylon fabric, according to Patent 2,285,967, granted to Vernal R. Hardy and assigned to E. I. du Pont de Nemours & Co., Inc., Wilmington, Del.

In making nylon fabrics, the yarns before weaving generally are cold-drawn or stretched to increase strength and fineness. In the new method nylon fabric is used composed of yarns which have not been cold-drawn or only partly. The fabric blank is put into a cold-drawing apparatus, comprising two plates which can be clamped together. One plate carries the fabric, the other a die or mold of the article to be stamped out. The plates are pressed together, and the die molds the fabric to the shape of the garment being formed. Pressure causes the fabric to be cold-drawn into the desired three-dimensional shape, which is permanently set by treatment with hot fluids or steam.

Work on Dried Meats Progresses

WORK expected to save at least half and possibly three fourths of the space in refrigerated bottoms necessary to provide a minimum meat ration for Great Britain at present and, it is believed, most of Europe and Asia after the war is being conducted by the U. S. Bureau of Animal Industry at Beltsville, Md. The bureau is cooperating closely with larger meat packing companies and the scientific laboratory of the American Meat Institute.

At least three fourths of all lean meat and a somewhat smaller percentage of fat meat is water. A score of new products have been devised, but it is admitted that when all the water is removed from the meat, the resulting product is wrinkled, brown, and bad smelling. When water is added, however, it becomes almost indistinguishable from the original meat. The present plan is to take out only about 75 per cent of the water, which results in a product more like the types of semidried meat already accepted by the American people.

SEPTEMBER 7–11
BUFFALO
·A·C·S·

Golf at Buffalo A. C. S. Convention

September 7 to 11, 1942

EVERY chemist attending the meeting of the A. C. S. at Buffalo needs some diversion for relaxation. Those who enjoy a round of golf will find the layout of the three courses made available to AMERICAN CHEMICAL SOCIETY members and their friends both interesting and scenic. The Niagara Falls Golf and Country Club, where the regular A. C. S. Golf Tournament will be held, offers not only an interesting 18 holes of golf, but a 19th hole where you can forget the number of times you shot out the sand trap. No golfing chemist should miss the opportunity to get his quota of ultraviolet and vitamin B.

Top. At the tee of the 16th hole, breastworks from the War of 1812 can be seen at right of the stake in the foreground. *Center.* R. L. Murray, president of Niagara Falls Country Club and member of A. C. S. Golf Committee, putts it out on the 18th green with J. S. Reichert holding the pin and W. Klabunde, vice chairman of Golf Committee, an interested observer. *Bottom.* Niagara Falls Country Club.

Paul Allen, Jr., professor of chemistry at Lynchburg College, Lynchburg, Va., will join the Chemistry Department of the Stevens Institute of Technology, Hoboken, N. J., on September 1.

J. B. Ambler has been appointed district representative of the Pittsburgh Lectrodryer Corp., with offices in Denver, Colo.

Holger C. Andersen, who received his Ph.D. from Harvard in June is now engaged in research in the Vacuum Equipment Department of Distillation Products, Inc., Rochester, N. Y.

S. J. Averill has received an assistantship in chemistry at Williams College, Williamstown, Mass.

Raymond C. Bender has been appointed to the technical staff of the Food Research Laboratories, Inc., Long Island City, N. Y., as nutritionist in charge of the bioassay laboratories. **Mona Oser** will continue in an administrative capacity. Dr. Bender was formerly connected with the Harris Laboratories, Inc., Tuckahoe, N. Y.

Julius A. Berninghaus

Julius A. Berninghaus, general manager of sales of the Organic Chemicals Division, Monsanto Chemical Co., has been appointed general manager of the division. Mr. Berninghaus has been with the company since 1926.

Oliver Bowles has been named chief of the Nonmetal Economics Division, U. S. Bureau of Mines, Washington, D. C., succeeding **Paul M. Tyler** who has joined the Board of Economic Warfare. Dr. Bowles has been with the bureau since 1914.

Captain Max A. Bradshaw, F. A., U. S. A. formerly of the Eastern Regional Research Laboratory, Philadelphia, Penna., reported for active duty at Camp Lee, Va., on June 15. He is assistant plans and training officer on the staff of **Major General James E. Edmonds.**

Rex H. Bradt, consulting chemist in process development work, formerly of Battle Creek, Mich., has been appointed head chemist of the Midland Ordnance Foundation, in Illinois.

William T. Caldwell, chairman of the Department of Chemistry and dean-elect of the College of Liberal Arts and Sciences of Temple University, Philadelphia, Penna., is one of 13 members of the undergraduate departments to participate in a $10,000 research fund established three months ago by the president. He is making an exhaustive study of the sulfa drugs.

Ernest Campaigne left his position as research associate at Northwestern University on June 1 to accept the position of instructor in preventive medicine and public health at the University of Texas Medical Branch, Galveston, Tex.

H. I. Cramer, Sharples Chemicals, Inc., Philadelphia, Penna., addressed the 25th annual Canadian Chemical Convention at McMaster University, Hamilton, Ontario, Canada, June 2, on "Synthetic Rubber". On July 15 he presented a popular lecture on synthetic rubber at Harvard University under the joint auspices of the Harvard Summer School and the Boston and Cambridge Branch of the American Association of Scientific Workers.

Charles Fournier, at the expiration of his contract with the Urbana Wine Co., Hammondsport, N. Y., has been retained as chemist and production manager.

James H. Fry has given up his position with the Celanese Corp., where he was employed as chemist, to become supervisor at the Chickasaw Ordnance Works in Tennessee.

James L. Gabbard, assistant professor of chemistry, Michigan State Normal College, Ypsilanti, Mich., has accepted a temporary appointment for the summer months with the U. S. Bureau of Mines and is now working in the Electrochemical Laboratory at Norris, Tenn.

Charles L. Gabriel for 22 years connected with the Commercial Solvents Corp., has joined the Publicker Commercial Alcohol Co., Philadelphia, in a technical executive capacity in the development, production, and distribution of chemical products.

Eugene D. Gardner, supervising engineer of the Southwest Experiment Station of the U. S. Bureau of Mines, has been appointed regional engineer in charge of the newly organized Central States Office of the bureau at Rolla, Mo., which will expedite the exploration and development of strategic war minerals.

Francis W. Godwin, assistant director of the Armour Research Foundation, Chicago, Ill., and **John A. Shellenberger,** agricultural biochemist on the foundation staff, are engaged in making an industrial survey of Argentina. They were recently made members of the Asociación Química Argentina. Dr. Godwin recently addressed the British Empire Service Club and the Asociación de Tecnólogos del Rio de La Plata, Buenos Aires, on the subject of "New Methods of Industrial Research".

Grafton B. Hale has been transferred from the Sales Service Laboratory of Penick & Ford, Ltd., Inc., Cedar Rapids, Iowa, to the new Sales Service Laboratory in Atlanta, Ga., as chemist in charge.

C. J. Huelsman, formerly chief chemist for the Hilton-Hawley Co., is now going through a training period at the Procter & Gamble Defense Corp.'s plant in Tennessee, after which he will be a supervisor in the Planning Department at the company's plant at Aberdeen, Miss.

Thomas J. Knapp

Thomas J. Knapp, former traffic manager and assistant sales manager of the Freeport Sulphur Co., has been elected assistant vice president. He was also made assistant vice president of the Freeport subsidiaries, Cuban-American Manganese Corp. and Nicaro Nickel Co., and will supervise the shipment of materials and supplies to Cuba for the

$20,000,000 nickel plant and facilities now being built there.

B. E. Lauer has been on active duty with the Chemical Warfare Service since January 28 and is now assigned to the Rocky Mountain Arsenal in Colorado.

Victor H. Lawrence

Victor H. Lawrence has been appointed general superintendent of the Otis Works of the Jones & Laughlin Steel Corp., Cleveland, Ohio.

Irvin Levin is now associated with the Chemistry Department of the Elec tronics Section of the Radar Laboratories, Signal Corps in New Jersey. He was formerly with the Research Laboratories of Sealtest, Inc., Baltimore, Md.

John W. Livingston

John W. Livingston has been released to the Rubber Reserve Co. as consulting engineer by the Monsanto Chemical Co., and will have headquarters in Washington, D. C. Mr. Livingston has submitted his resignation as vice president and member of the board of Monsanto and general manager of its Organic Chemicals Division.

J. Perry Morgan, formerly assistant professor of chemistry at the Stevens Institute of Technology, Hoboken, N. J., received the Ph.D. degree in chemical engineering at Columbia University in June. He has joined the Development Division, Esso Laboratories, Standard Oil Development Co., Linden, N. J.

David J. Beaver, R. L. Sibley, and Harry A. Merkle

R. L. Sibley, director of research of the Rubber Service Department, Organic Chemicals Division of Monsanto Chemical Co., has been appointed general manager of manufacturing in charge of all production and research activities at Nitro, W. Va. **David J. Beaver** becomes research director of the Rubber Service Department, and **Harry A. Merkle,** production superintendent of the Nitro plant, succeeds **Herman K. Eckert** as plant manager. Mr. Eckert has been named plant manager of Monsanto's synthetic rubber chemicals plant in Texas.

Alamjit D. Singh, a member of the Experimental Engineering staff of the University of Illinois, has been appointed associate chemical engineer at the Armour Research Foundation, Chicago, Ill. He is also technical adviser on chemical obscuration in civil areas for the organization on techniques for the Chicago Office of Civilian Defense.

John T. Staker has been made manager of the recently formed Tire Conservation Department of the B. F. Goodrich Co., Akron, Ohio, and **James E. Carhart** has been appointed as his assistant.

Charles W. C. Stein, who received his Ph.D. at the University of Pennsylvania, has joined the chemical research staff of the General Aniline and Film Corp., Grasselli, N. J. Dr. Stein was formerly employed as an assistant instructor in chemistry at Drexel Institute.

Herman W. Steinkraus has been elected president and general manager of the Bridgeport Brass Co., Bridgeport, Conn.

Walter J. Stewart, formerly chemical engineer at the Williams Mfg. Co., Portsmouth, Ohio, is now assistant superintendent at the Republic Plant of the Vulcan Detinning Co., Pittsburgh, Pa.

J. Edward Todd has been appointed assistant to the dean of the Institute of Paper Chemistry, Appleton, Wis.

Robert S. Weisz has recently received the Ph.D. degree from Cornell University and is now working on electrical porcelain on a Westinghouse research fellowship in the Westinghouse Research Laboratory, East Pittsburgh, Penna.

V. E. Wellman has been appointed manager of the recently created chemical and pigments department of the purchasing division of the B. F. Goodrich Co., Akron, Ohio.

E. C. Williams, vice president and director of research of General Mills, Inc., has joined the board of the General Aniline and Film Corp., New York, N. Y., where he will be responsible for all research and technical developments.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training. Future developments will be brought to the attention of our readers.

WORLD-WIDE CHEMISTRY

Direct taxation on incomes and profits, and indirect taxation on commodities and services without striking at the necessities of life featured Canada's 1942 budget presented June 23, 1942, by the Minister of Finance, J. L. Ilsley.

The budget was noticeably indifferent to sources of revenue which in past years have featured tax increases, such as tea, coffee, gasoline, motor cars, and other commodities now under rigid wartime control.

New Taxes Are Imposed

The following tariff changes of chemical interest, however, were made: The tariff is eliminated on crude cottonseed oil for canning fish and on magnesium scrap fit only for remelting, fuel injection pumps and nozzles for Diesel and semi-Diesel engines, wick for the manufacture of wax candles or tapers, net floats of aluminum, glass, canvas, cork, rubber, or cellulose acetate, and on resin or rosin.

Under a new item, duty-free entry is provided from all countries for machinery, apparatus, and parts for use in producing oil from shales, for operating oil sands by mining, and for extracting oil from such sands.

Amendments are made to the items covering prepared or preserved vegetables, orange juice, grapefruit juice, and silicate of soda, to facilitate administration.

Industrial Waters of Canada Are Studied

The Dominion Bureau of Mines in a recent publication has reported analyses of Canadian natural and treated waters, begun in 1934. The investigations constitute a systematic study of the various waters of Canada in use, or available for use, either domestic or industrial. Information has been collected and correlated about the water needed by industries on the one hand and the quality of Canadian waters on the other. Complete chemical analyses of surface waters are given; also partial analyses of civic water supplies.

Industrial problems confronting large users of water are discussed and a water-hardness map of Canada is included.

Gasoline Rations Are Further Reduced

Gasoline rationing regulations have been further tightened. Tourists entering Canada are now given only four ration coupons; each permits the purchase of four imperial gallons of gasoline.

Ontario Research Foundation at Toronto Aiding War Effort

More closely allied to the Mellon Institute type of research institution than any other in Canada, the Ontario Research Foundation at Toronto is financed by income from its original endowment and by fees which it charges for services. The Province of Ontario contributed dollar for dollar with industry to create the main fund. The investment account of the foundation now totals $3,564,484.

The Director of Research reports that the foundation has become increasingly concerned with problems associated with the war. Much work has been done for the Inspector General, chiefly on gages. In biochemistry it has been confirmed that vegetable-tanned leathers which have a high acidity in the finished state deteriorate more rapidly than similar leathers in which the acidity has been kept within certain limits. Work is proceeding on abrasion tests in relation to wear of leather. Production of organic acids from sugar by chemical and biological methods has been continued. Foodstuffs, including bread, have been studied for vitamin content.

Pathological, entomological, and soil studies of interest to farmers have been carried on in the agricultural laboratories. In the textile laboratories it has been possible to maintain a reasonable balance between testing, short-term problems, and more fundamental research. Cooperative work with industry has been done on silk problems. Mineral oil substitutes for more expensive vegetable oils have been tried in the processing of wool.

In chemistry, service problems for industry predominate, and vary from steaming of horizontal retorts, in a gas plant, to investigation of defects in dinnerware. Facilities of the metallurgical laboratories have been used for gage-testing, heat-treatment, physical testing, and metallography. Long-term research programs have been halted for the present.

Medal Awards Made for Research

The Royal Society of Canada has awarded the Flavelle Medal for original research of special and conspicuous merit to J. H. Craigie, head of the Dominion Rust Research Laboratory at Winnipeg, Man. The work which won him the medal was in connection with the control of wheat rust, which has cost the farmers of western Canada an average annual loss of $30,000,000.

L. M. Pidgeon, National Research Laboratories, Ottawa, has been made a Fellow of the Royal Society of Canada for his development of a method now in commercial use for the reduction of metallic magnesium from its ores. W. D. Macfarlane, head of the department of chemistry at Macdonald College, McGill University, has also been named a fellow.

The Society of Chemical Industry (Canada) Medal has been given to R. A. Witherspoon for his outstanding achievements in the electrochemical field with Shawinigan Chemicals Limited, at Shawinigan Falls, Que.

Expansion Noted in Chemical Industries

Official figures for 1941 recently published show a production value of chemicals and allied products of $268,500,000, as compared with $193,900,000 in 1940. Some 23 new units for the manufacture of explosives and intermediate chemicals were brought into operation during the year. Practically every branch of the chemical industries showed an advance and some reached new record outputs.

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

Heavy chemicals increased about 59 per cent, coke production 5 per cent, artificial abrasives 48 per cent, soaps 23 per cent, paints 27 per cent, petroleum refining 45 per cent.

Striking increases were recorded in 1941 for both imports and exports of chemicals and allied products. Imports at $65,400,000 were $13,600,000 higher than in 1940, with the principal increases being in acids, inorganic chemicals, dyeing and tanning materials, and in paints and pigments. About 82 per cent of all purchases came from the United States and 14 per cent from Great Britain.

The value of exports at $58,700,000 was almost double the corresponding figure for 1940. This marked a threefold gain in exports to the United Kingdom and a 50 per cent gain in exports to the United States.

New Chemicals Controller Appointed

The Minister of Munitions and Supply has appointed Edward T. Sterne, general manager of Sternson Laboratories, Brantford, Ont., as Chemicals Controller, in succession to J. D. Lorimer, resigned. Mr. Sterne has been with Allied War Supplies since its inception in July 1940. Prior to that he was with the explosives and chemicals production branch of the Department of Munitions and Supply. During World War I he was chief chemist of the Imperial Munitions Board explosives plant at Trenton, Ont., and later went to England as foreign technical representative of the Shawinigan Water and Power Co.

S. J. Cook

140 Broadway Ave.
Ottawa, Canada
July 16, 1942

Continental Europe

Germany

I. D. Riedel–E. de Haen A.-G., reports that employment in its pharmaceutical works was maintained during 1941. Sales in the home market increased, and exports to continental countries were also higher. P. Beiersdorf & Co. A.-G., reports for 1941 that several cosmetic products were made in small quantities only, but the total of sales was unchanged owing to larger demands for pharmaceutical specialties. Word from other German pharmaceutical manufacturers indicates an increasing demand for synthetic products that can replace imported drugs, especially from other European countries which now, having exhausted their prewar or preoccupation stocks of imported drugs, require additional supplies of medicines. The manufacture of cosmetics has been reduced, and the public has been disappointed by some of the substitutes offered to them.

War Stimulates Demand for Flavoring Essences

Production of flavoring essences for foodstuffs and drinks has greatly increased during the past decade and particularly since the beginning of war. The present output has been estimated at over 80,000,000 marks. Although about 500 firms are engaged in the manufacture of flavors and aromas of different kinds, half the production is provided by the 15 largest firms. The 400 small firms in the trade produce only 10 per cent of the output. The flavoring industry has undergone a considerable expansion since the liquor distillers have had to change over to the manufacture of nonalcoholic hot and cold drinks. A large demand also exists for aromas suitable for bakers and pastry cooks, and more than one third of the total production is used for making sweets. The flavors were so bad in many cases that they had to be put under control on January 15. Since then many products seem to have disappeared from the market, but the demand for genuine articles remains very large.

Vitaminized Jams Provide Market for Yeast Products

To replace vitamins destroyed in the normal process of jam making, German factories have followed government instructions and included synthetic vitamin products in their preserves. This outlet is reported to provide a valuable market for vitamin B obtained in the form of yeast products from wood by saccharification. In cooperation with the Supreme Army Command, a new process has been developed for the manufacture of dry pulps for jam making which, it is claimed, allows conservation of the natural vitamin A and C contents during prolonged storage.

Substitutes Sought to Alleviate Fat Shortage

The extreme shortage of animal and vegetable fats has caused German chemical manufacturers to look for possibilities of saving fats. Even the comparatively small quantities of fats and oils required for the pharmaceutical industry are to be reduced by increased application of aqueous emulsions, mucilage, jellies, colloidal silicic acid, and aluminum hydroxide paste. These replace fats and greases in cosmetics.

The soap industry, which before the war absorbed something like 200,000 tons of vegetable and animal fat products, has been hit by the necessity to make full use of edible fats for the manufacture of margarine. Output of waste fats has declined consequently, with the result that increased use must be made of cleaning powders. These do not in general contain more than 3 per cent of fat, and this small percentage is made up of synthetic products derived from paraffin or naphthalene. Chestnut flour and other vegetable materials are added to the powders to facilitate formation of a lather, while the remainder of the cleaning powders usually consists of soda or silicate and kaolin, pumice, or other abrasive fillers. Many hundred preparations of this kind are on the market.

Devices for Saving Oil Suggested In Paint Trade

The paint trade, normally the third of the large consumers of vegetable oils, following margarine and soap factories, has been using increased quantities of synthetic resins. It is thought that important savings in the use of oils in the paint trade can be obtained by technical changes. Thus drying power may be increased by dehydration or separation of glycerides into a drying and a nondrying part, while another proposed device for saving oil is an increase in molecular size of the pigments to reduce the amount of oil required to make the paint film impermeable.

Area under Oil-Yielding Plants Is to Be Increased

Great efforts are being made to increase the acreage under linseed, rape, poppy, safflower, and other oil-yielding plants in Germany as well as in countries of southeastern Europe under German influence. In Germany next year 750,000 acres are to be planted with rape and 125,000 acres with poppy. This year 500,000 acres have been set aside for rape, and production of flax is to reach 50,000 tons. A catalytic process has been developed to speed up the removal of wood constituents surrounding the flax fiber. It is hoped to produce a special type of linseed which gives a short but strong fiber and at the same time yields large quantities of oil, but at present agricultural research stations are far from producing a satisfactory plant.

Salzdetfurth, Potash Firm, Reports on 1941 Activities

Salzdetfurth, second largest potash producer in Germany, reports for 1941 that potash production again increased, but sales were somewhat smaller than in 1940. While average prices for potash salts were slightly better, there was a change in the direction of demand towards the higher priced products. Last year

Salzdetfurth invested 10,800,000 marks, as compared with 7,800,000 marks in 1940, for the extension of production facilities. Part of this was probably caused by increasing demand for manufactured products, but the chief reason for the large new investments in the German potash industry is found in the desire to make more use of mechanical processes for handling and manufacturing potash salts. A new salt mine was opened this year, while existing salt mines had, owing to special reasons, to reduce output and sales but worked satisfactorily. Salzdetfurth holds important interests in the German copper mining industry as well as in lignite mining and metal manufacture where output figures were generally higher in 1941. The metal mining operations have been extended to other European countries, but nothing is known about the profitability of these activities. Accounts of the Salzdetfurth combine are usually made to fit with dividend proposals and do not say much about the financial side of the company's operations.

I. G. and Rütgers Join in Forming Fluorspar Company

Demand for fluorspar has risen greatly since the beginning of the war. In Thuringia, where the district of Ilmenau is now the largest fluorspar producer in the country, a valuable colorless material has been found which is used for the manufacture of optical lenses in the place of foreign fluorspar imported before the war. I. G. Farbenindustrie and Rütgers, two chemical companies with considerable interests in fluorspar mining, have formed a new joint company, Flusspatwerke G. m. b. H., with a capital of 800,000 marks. This company is to take over the fluorspar properties of the two founders and to engage in mining and manufacture not only in Germany but in other European countries and in non-European territories dependent on European states. In the present circumstances this seems to refer to French North Africa.

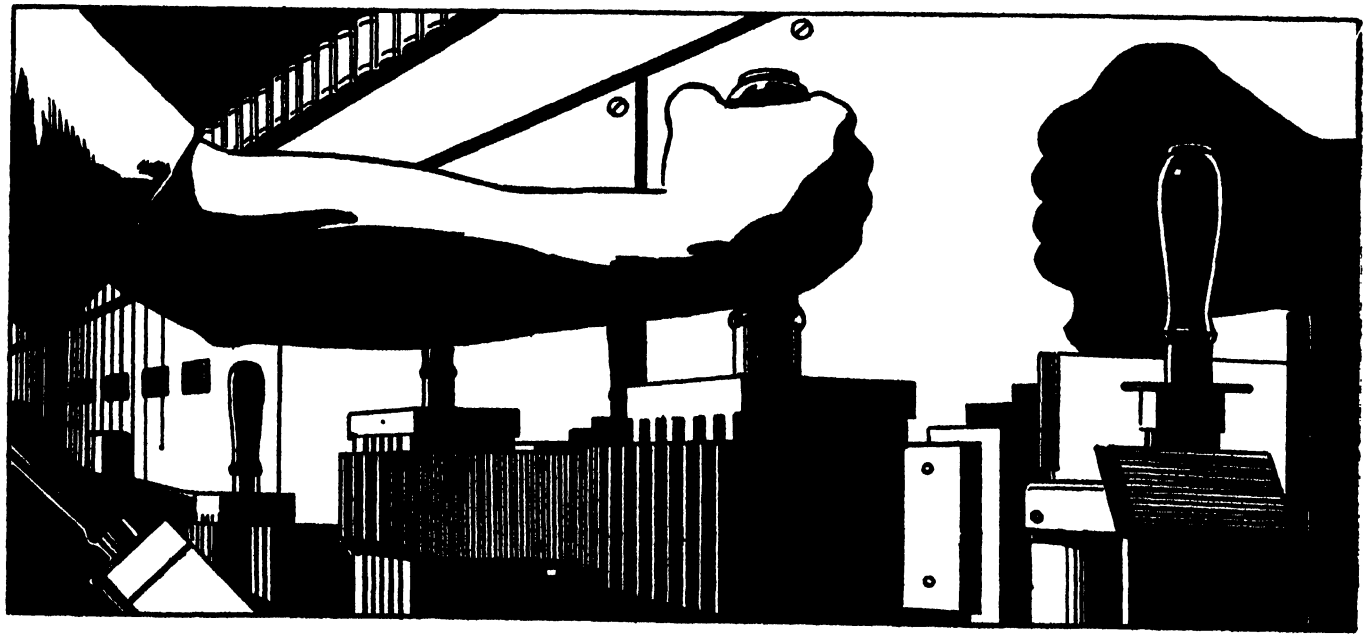
Chemistry of Furs Investigated at Munich

A Fur Chemical Laboratory has been established at Munich by the Reich Center for Research on Fur-Bearing Animals and Furs. It is to investigate the efficiency of chemical and other products used by furriers and advise the industry on merits of different products.

Cellulose Factories Form Research Company

Forschungsgesellschaft für Faserrohstoffe, m. b. H. (Research Company for Fiber Raw Materials, Ltd.) has been formed by about 50 firms with interests in the cellulose, paper, and cellwool industry for the investigation of raw materials not yet in industrial use. The new company is reported to be especially interested in utilization of the large reed banks in the delta of the Danube River.

Low-Temperature Carbonization for Gasworks and Power Stations



Low-temperature carbonization has been encouraged in Germany because of the larger output of liquid fuels compared with high-temperature carbonization, with the result that new outlets had to be developed for low-temperature carbonization coke and gas. They are used for the production of energy, and experiments are under way for a more general application of low-temperature carbonization to coal and lignite before they are burned in power stations. Increased use in gasworks has been hindered by the fact that the optimum size of a low-temperature carbonization plant is at least 1,000 to 2,000 tons of coal a day, so that smaller gasworks cannot make advantageous use of it unless they are grouped together in larger regional units. The combination of gasworks as producers of low-temperature carbonization coke and electricity stations as consumers may open new possibilities.

Southeastern Europe Provides Magnesium Sources for Germany

Germany has two sources of raw materials for the production of metallic magnesium at her disposal—the magnesium salts from the potash mines in Hanover and Saxony and the magnesite deposits in Bavaria and Austria. The Austrian magnesite deposits in particular provide a valuable raw material, not only for the magnesium industry but also for the manufacture of refractories and other industrial products. The companies interested in magnesite mining in Austria have been cooperating for some time by the formation of a research company. A new enterprise, Südost-Magnesit-Gesellschaft, now has been formed with a capital of 1,000,000 marks. Several magnesite producers are interested in the new company which is to buy, rent, and operate magnesite mines, apparently not only in Austria but also in the adjoining territories of Yugoslavia and possibly even in Greece.

Yugoslavia

Dynamit Nobel, the important chemical producer at Bratislava, Czecho-Slovakia,

which is now under the control of German interests has formed a subsidiary, Dynamit Nobel, Belgrade, with a capital of 5,000,000 dinar for the sale in Serbia of chemicals, lacquers, explosives, and fertilizers. The new company is also to advise farmers about the advantages of chemical fertilizers.

Czecho-Slovakia

Prager Chemischer Verein, one of the leading producers of chemicals in the Protectorate of Bohemia and Moravia, reports for 1941 a 30 per cent increase in sales. Production and sales of inorganic chemicals were slightly better than in 1940, while output of organic products has been greatly increased through the opening of a new plant where pharmaceutical preparations are being made. Production of paper and cellulose has been regulated by agreement, and sales of pharmaceuticals increased owing to the marketing of several new specialties. The department for the manufacture of substitute products met wartime requirements. Several important export contracts were received, and subsidiaries in other countries worked well, with the exception of the plant in Yugoslavia. The chemical industry in Czecho-Slovakia appears from other reports to have benefited from the movement of the industrial plant to the eastern provinces of Germany. Efforts have been made by the German authorities to make full use of producing facilities in the Protectorate.

Rumania

The Rumanian Company for the Production of Romacol has been formed with a capital of 40,000,000 lei by Creditul Minier, the Rumanian Chemical Works, and the Rumanian Wire Industry Co. The new company, which will manufacture synthetic rubber from by-products of the Rumanian petroleum industry, is to erect two factories and has been authorized to ask the Minister of Finance for credits up to a total of 100,000,000 lei. The Minister of Finance is to receive 12,000,000 lei of founders' shares. The government credit is to be repaid within three years after the beginning of production.

Hungary

Great efforts have been made in recent years to build up a large aluminum industry in Hungary using the local bauxite deposits, but these plans have made slow progress because of the difficulty of procuring construction materials and the lack of fuel and electric power. Since the return of the northern part of Transylvania to Hungary, plans have been prepared for the generation of electricity in the Carpathians. The Hungarian Bauxite Mines Co., which was formed in 1937 and has been producing bauxite since 1939, is building an alumina plant with a capacity of 20,000 tons and an aluminum refinery for 10,000 tons a year. The company has the technical, and apparently financial, support of Dürener Metallwerke, the German light metal firm, well-known for the development of duralumin.

The first alumina plant in Hungary was built by the Bauxite Industry Co., a subsidiary of the Swiss Bauxit-Trust A.-G., which supplies the material to the aluminum refinery at Csepel, now reported to be capable of an annual output of 3,000 tons, and the smelter of Hungarian General Coal Mining Co. at Tatabanya, credited with a yearly capacity of 2,000 tons. Another alumina plant is to be built by Danube Valley Alumina Industry Co., another subsidiary of Bauxit-Trust A.-G., which was formed only last year.

Total investments for the extension of the Hungarian light metal industry are stated to be 24,000,000 pengö. Bauxite production in 1940 was reported to be 564,000 metric tons and an increase by about 50 per cent was said to have been reached in 1941, but most of this tonnage was exported to Germany. The alumina and aluminum plants now being built will use only a small portion of the Hungarian bauxite output.

Finland

Great efforts have been made in Finland to increase the output of nonferrous metals and, since the recovery of the part of Karelia ceded to Russia in 1939–40, Finnish and German engineers have been active on the repair and expansion of mines in that region. Although little detailed news is available about the progress of the metal mining activities in this and other parts of the country, it is reported that a plant being erected by Outukumpu O. Y. at Pori, which is the first of its kind in Finland, will supply 400 tons of nickel a year after its completion. Meanwhile the company is producing copper-nickel ore at the rate of 18,000 tons annually, but most of this at present is probably sent to German refineries.

Finnish Charcoal Plant to Produce Turpentine, Methanol

A large charcoal plant capable of an annual output of 30,000 cubic meters of charcoal is to be built in Finland, and special attention is to be paid to the recovery of by-products such as wood tar, turpentine, and methanol. Production of charcoal in the Finnish forest regions has made considerable progress because of the shortage of imported fuels, and charcoal is being used on an increasing scale as a gas generator fuel for motor vehicles and coastal vessels.

Government Organizes Exploitation of Peat Bogs

The large-scale exploitation of peat from the vast bogs in various parts of the country is to be undertaken under directions by the Finnish Government. A semiofficial company is to be formed by the government to carry out all industrial activity in connection with the utilization of the peat. Research conducted in other countries of Continental Europe has been investigated, and it is thought possible that peat products will provide Finland with some of the fuels for ordinary furnaces and generators which can no longer be imported. Attention has been paid to the production of peat coke and peat tar, and the Finnish Council of State has authorized the Ministry of Supplies to spend 350,000 Finnish marks on experiments for the manufacture of lubricating oils from peat. This has not yet been attempted in other countries, although it is known that in experiments in Germany liquid or viscous products have been obtained by low- and high-temperature carbonization of peat. This opens up the possibility of producing a lubricant substitute from peat.

Sweden

Increasing difficulties in importing foreign raw materials for use in Swedish industries, which have been noted ever since the occupation of Norway and have become especially noticeable in the past six months, have given rise to the development of several local substitutes. Glycerol is being produced in a cellulose plant in Norrland from ethylene glycol. Pine oil used for the flotation of copper concentrates has been replaced by a product called "pinol" which is prepared from turpentine sulfate. A pine oil of Swedish origin, on the other hand, is being used instead of oleum for the treatment of apatite slick as used in the manufacture of phosphatic fertilizers, since imported rock phosphates are no longer available.

Big Increase in Swedish Fodder Cellulose Production

Under an agreement concluded between the Industrial Commission acting for the Swedish Government and the association of cellulose producers, the production of fodder cellulose is to be raised to 550,000 tons in the year ending May 1943. This means that the output reached in 1941–42 will have to be nearly doubled in the next 12 months and substantial extensions to existing plant will be necessary, as the

wood pulp requires special preparation before its chemical treatment for feeding purposes. Prices have been left unchanged, but may be altered in the future. Meanwhile it is announced that several manufacturers have begun to manufacture compound feeding stuffs with a basis of fodder cellulose to which organic or inorganic substances are added to give a more or less balanced diet.

The Netherlands

Allgemeene Kunstzijde Unie, the Dutch rayon producer who maintains intimate connections with the leading German rayon and cellwool combine, reports that the output in 1941 was slightly higher than in the preceding year, but most of it was sold in Holland and exports seem to be of less significance than before the war because of the lack of natural fibers in the local market. Staple fiber rayon has been marketed as a substitute of wool and cotton. Output of casein wool has been considerably increased; the experimental station at Arnhem was closed before the end of 1941 as the new factory at Ede had been opened. The structural foundation has been laid for the new cellwool factory, and it is expected that the production of cellwool will begin in the autumn of 1942, provided the machinery is supplied in time. The production of straw cellulose which is to provide the raw material for the cellwool factory will not, however, commence this year, so that at the beginning other raw materials will have to be used.

Belgium

Rayon production in Belgium was about 5,500 tons in 1941, and since imported fibers become even more difficult to procure, great efforts are being made to increase the output. By utilization of all available plants and extensive rationalization measures the output capacity could be increased by about 20 per cent over 1941. Cellwool production was at a rate of 3,200 tons annually early this year, but a new plant which will produce 750 tons per month by the end of this year is reported to be ready for production. Even then Belgium will be unable to produce more than a fraction of the normal consumption of textiles. Development of the casein wool production has been held up by raw material difficulties.

France

Since the Armistice French commercial and industrial enterprises have generally drawn upon available stocks to the maximum extent, with the result that most raw materials are difficult to supply while industrial companies are in possession of large amounts of liquid funds for which new outlets must be found. In the French chemical industry this trend has been accelerated by the transfer of fixed assets to German control (as, for instance, by the sale of French dyestuffs factories to the I. G. Farbenindustrie-controlled Francolor company) and by the liquidation of French holdings in eastern European industries. The balance sheets recently published by leading chemical producers show a satisfactory degree of liquidity, but the dividend policy remains cautious.

Most producers prefer to use their funds for investments in new enterprises for the utilization of local raw materials. Chemical producers play a leading role in the development of new deposits of coal, lignite, shale, peat, potash, sulfur, etc. They have engaged to a growing extent in the production of synthetic fuels, artificial rubber, and synthetic fibers, mostly under variations of German patents, and much interest is also being shown for plastics which can take the place of imported metals, vegetable oils, etc.

Great capital requirements have been reported by companies with interests in the light metal industry which has received large orders from Germany. Pyrites and iron sulfides in southern France are to be exploited by St. Gobain. Production of cellulose from reed and sugar cane has been begun by the new Société Française de la Cellulose, Marseilles. Output of most synthetic products, however, is still rather small, as expansion has been delayed by the lack of construction materials. The more ambitious enterprises in the field of synthetic production will not be completed before 1944 or 1945. In the field of synthetic fibers, however, substantial progress is anticipated for the current year. According to plans, the output of rayon is to be raised from 31,000 tons in 1941 to 45,000 tons in 1942, while that of cellwool is to be increased from 21,000 tons in 1941 to 40,000 tons in 1942. The casein wool factory at Wasquehal is reported to produce 40 tons a month at present. There is a possibility that the production of nylon, which has been carried on for some time, will be followed by production of other fully synthetic fibers of German type.

Spain

Sociedad Iberica del Nitrogeno, the Spanish company which was formed by the iron producer Duro Felguera, the Union Espanola de Explosivas, Solvay & Co., and several Spanish financial institutes, according to recent reports, will increase its capital to 70,000,000 pesetas. All the available funds will be used for the extension of the plant now in course of erection at La Felguera so that the production can be raised to 10,000 tons of ammonium sulfate by next summer. The company has concluded an agreement with Air Liquide, the French owner of the Claude patents, and Société Chimique de la Grande Paroisse, a subsidiary of Air Liquide, for the supply of equipment. The exact date on which production will begin depends largely on delivery of the machinery by the French firms. Sociedad Iberica del Nitrogeno will also build a plant for utilization of waste gases from the smelters of Duro Felguera, and special attention is to be paid to the recovery of valuable by-products.

Plant to Manufacture Chromates to Be Built

Societa Electroquimica de Flix has been authorized by the Spanish Government to erect a plant for the manufacture of chromates and dichromates. Local raw materials are to be used in the new factory.

Italy

Azienda Nazionale Idrogenazione Combustibili, the Italian hydrogenation company that uses chiefly crude oil from Albania which cannot be refined by the ordinary methods, reports in its annual statement that it is producing lubricating oils, transformer oil, and paraffin wax in addition to aviation and motor fuels, gas and fuel oil, and butane, so that the average proceeds in hydrogenation works now amount to 90 per cent of the raw material intake. Conditions of production are described as satisfactory, but raw material prices and costs have been rising, and the company has been compelled to draw upon credits granted by Banca d'Italia. In the future no more credits are to be used as the Italian Government has decided to give subsidies to oil companies.

New Methane Gas Company Formed in Italy

Societa Italiana per il Gas (Italgas), the large company which supplies the towns of Rome, Genoa, Turin, Florence, and Leghorn with gas, reports that a new company, Societa Mineraria Rosolina, has been formed for development of methane gas sources at Rosolino d'Adda. The daily production capacity is 8,500 cubic meters.

Egyptian Beeswax Imports Gain 150 Per Cent in 1941

ACTIVE demand for Egyptian beeswax led exports in 1941 to a total of 4,393,500 pounds, compared to 1940 shipments of 1,749,320 pounds, an increase of 150 per cent. At the close of 1941 and during early 1942 pure beeswax was quoted at $790 per ton f. o. b. Egyptian ports.

United Kingdom Committee Ponders on Postwar Problems

APPOINTMENT of a central committee, representing export groups, to anticipate postwar trade problems has been announced from abroad on the part of the president of the United Kingdom's Board of Trade. Chemical and allied industrial groups are strongly represented in the committee.

The chemical trade of the United Kingdom, along with other groups, has felt the losses of the recent war years very heavily. Many markets have been entirely closed, and others cut off by shipping priorities. The United States Lend-Lease Act has directly affected the export situation of England's trade in this field, and a virtually complete reorientation of export policy has followed from this and other factors.

Among outstanding problems of postwar importance, it is said, are establishment of a coordinated export trade program among nations and concentration of the United Kingdom's export trade on such products as promise to represent an essential phase of world markets in the postwar period. It is foreseen in this connection that fine chemicals, plastics, and similar materials may assume a larger place, with less emphasis on the heavy chemicals.

Sulfur Surveys Fail to Benefit India Greatly

VARIOUS obstacles, patents, lack of plants, have acted to deprive India of any great commercial benefit to date on the extensive surveys and other activities which have been conducted there on sulfur, through the interest of the Indian Board of Scientific and Industrial Research. Lack of interest on the part of industries producing waste gas has been a factor in the situation also.

India's Geological Survey located sulfur deposits capable of producing half a million tons, whereas it had always been the belief that India had no such deposits. A shortage in this supply might stimulate activity, it was felt.

Fertilizer Costs Fixed by Egyptian Government

THE Egyptian Government has fixed prices and averaged transportation costs to assure uniform regulation for the whole country. To reduce costs to the farmer, a sum was taken from the accumulated profits of the nitrate pool and applied to the cost of the fertilizers to be sold. Fertilizers are restricted by regulation to the following crops: maize and millet, potatoes and vegetables, sugar cane and rice. In the case of sugar cane, distribution of fertilizers earmarked for that use will be restricted to areas leased to the General Sugar and Refinery Association of Egypt.

Gum Exports in Sudan Decline

THE Anglo-Egyptian Sudan, imperiled by the present turn of the war in the Mediterranean area, is an important source of gum arabic, and this product shares with cotton as the Sudan's principal export.

War conditions leading to a loss of foreign markets has decreased total exports reported for 1941 to 16,000 tons for all three varieties, as compared with 22,000 tons total in the preceding year. A rise in prices for all varieties, the largest increase being for bleached gum, was reported for 1941. Exporters in the Sudan at the close of the year quoted gum arabic at about $11 per 100 pounds c. f. New York.

Annual exports normally are reported at 20,000 to 25,000 metric tons, the bulk being made up of hashab, collected by tapping gum trees over vast tracts of wild country. An inferior type, talha gum, grows in the eastern Sudan and is exported in smaller amounts. Most gum is sold at public auction in small local markets.

Exports from Brazil for War Use Increase in 1941

BRAZILIAN chemical exports for war use increased during 1941, and imports of such raw materials decreased in volume but rose in value, the U. S. Department of Commerce reports. Principal chemical products exported during the year were offset by imports which included mineral salts, caustic soda, and other inorganic chemical products totaling 85,306 tons, compared with a previous figure of 93,333 tons; pharmaceutical and organic chemical products, 42,420 tons against a previous 45,627 tons; aniline dyes, essences, and other primary synthetic materials, 6,682 tons, a gain over the former 4,773 tons.

Britain Expects Controls to Continue after the War

FORMAL government controls over Britain's chemical industry are anticipated for some time after the war, it is indicated in expressions from the industry in the United Kingdom. Operation of such controls at present is dealt with in reports following the 19th annual meeting of the British Chemical and Dyestuffs Traders' Association, held in May.

To facilitate the work of the association a cross-sectional group was established for each of the main chemicals, with a standing committee for each such group to work closely with the government control office. These industrial groups have acted at the request of the authorities in distribution of a number of chemicals imported under Lend-Lease, supplying also, under voluntary arrangement between producer and distributor, essential industries on a rationed basis.

Although the export volume has suffered, it is reported a fair amount has gone out for approved destinations and for essential requirements. At home the resourcefulness of the trade in finding or adapting substitutes for scarce materials has been noteworthy.

Chilean Sodium Sulfide Output Reduced by Decree

FORMAL decree that sodium sulfide is being overproduced has been announced in Chile. Two plants engaged in this production are barred from increasing their output, while other factories may not make the substance at all without special government authorization. Principal importers from Chile in this field are Argentina, Brazil, and Peru.

Lime Production in Mexican State Gains

CHIEF lime-producing center of Mexico, itself the leading producer in this hemisphere, and second probably only to Egypt in world-wide output, is the small state of Colima, about two thirds of the way down Mexico's west coast. Its area of 12,009 square miles and population of 61,923 accounts for 20 per cent of Mexico's lime-producing trees, stimulated by a humid tropical climate, volcanic soil, and other factors. Lime production in that area outranks sugar, coquito nuts, coconuts, rice, and other crops in importance. Dating from 1900, lime cultivation in Colima has attained an average of 25,000 tree plantings annually since 1936, and in 1941 about 40,000. It is estimated the state now has 200,000 to 250,000 trees.

Sulfur-Bearing Rock Found in Baluchistan

DEPOSITS aggregating 85,000 tons of sulfur-bearing rock averaging about 60 per cent sulfur content, have been discovered in Baluchistan by the Geological Survey of India.

An additional 300,000 to 400,000 tons averaging 35 per cent sulfur content can be obtained by mining at another locality, it is believed. Importance attaches to the report of these discoveries as sulfuric acid can be manufactured directly from sulfur of 60 per cent content, and pure sulfur can be extracted from this rock sulfur by a simple process.

Use of Paints in Australia Curtailed

AUSTRALIAN authorities have limited use of paints containing imported white or chrome pigments, synthetic resins and solvents, or mineral turpentine to defense purposes, both as to manufacture and supply. Other paints manufactured for civilian use have been curtailed 50 per cent of normal production.

POTOMAC POSTSCRIPTS

WPB Activities

To salvage approximately 100 million pounds of essential chemicals, WPB has asked manufacturers of war equipment to start immediately programs for the recovery and reclamation of wasted spray paints. Most of the things that come off war industries assembly lines must be mass-painted by spray-painting processes. This is where waste, usually called "overspray", occurs. It is known that about 30 per cent of the paint and finishings used in these processes can be recovered by tested and effective measures according to S. Donald Pearlman, director of the Chemical and Textile Units of the Conservation Division. Among materials which can be salvaged through widespread adoption of reclamation measures are pigments, phthalic anhydride, glycerol, oils, zinc yellow, glycerol phthalate resin, phenol formaldehyde, damar gum, alkyd resins, chlorinated rubber, ethyl cellulose, nitrocellulose, and plasticizers.

On the basis of available information, it is believed that a saving of approximately 100,000,000 pounds of these essential chemicals could be realized in the next year and a half through adoption of a salvage program. It is estimated that available facilities for reclamation of wasted spray paints are sufficient to handle all of the present requirements. Fourteen major paint and other companies have facilities available.

Aniline. Control of the distribution of aniline is taken under Order M-184. Consumers must file requests on Form PD-583 and producers and distributors must report monthly on Form PD-584. Restrictions of the order do not apply to use by the armed services of aniline produced by them, or to the use by any person of less than 500 pounds of aniline in a month.

Antimony. Control over antimony is revised in amended General Preference Order M-112. Supplies of antimony have become relatively more plentiful, and the order as amended will encourage the substitution of antimony for tin. Chemical derivatives with the exception of antimony oxide and sulfide, which are the result of primary processing, are removed from control of the order. Frit is included in the items covered, by definition. To encourage the fullest production of domestic ores, the amended order frees from restriction deliveries up to 50 tons per month of ores or concentrates by United States mines. Deliveries of 25 pounds or less of contained antimony are permitted to any one person in one month without an allocation. Nonceramic coatings may use up to 2 per cent antimony, and antimony may now be used in ceramic coatings only when they are designed to be acid-resistant.

Arsenic. Procedure by which users of arsenic in quantities of less than 500 pounds per calendar quarter may place purchase orders is simplified by Amendment 1 to General Preference Order M-152. The supply or control situation is not changed by this amendment, but simply the procedure.

Blackplate. Use of blackplate for cans is limited to a small list of essential products in Conservation Order M-136, which follows closely the pattern of Order M-81 concerning cans made from tinplate or terneplate. The first of two classes of products permitted to be packed in blackplate consists of products necessary for various military and civilian operations. Blackplate cans for these products are limited to 100 per cent of the combined area of tinplate, terneplate, and blackplate used in the calendar year 1940. The other group includes those products permitted to be packed under the terms of Order M-81, limitations for which are also specified. The new order, together with Order M-81, will result in an annual saving of about 1,000,000 tons of steel compared with 1941 consumption.

Cotton Linters. Delivery of cotton linters and hull fiber, essential raw materials used in making chemical cotton pulp for explosives and plastics, is forbidden except to designated makers of chemical cotton pulp by General Preference Order M-12 as amended July 22. The previous order, which expired on August 1, controlled only 80 per cent of the production of cotton linters. No person now may use cotton linters or hull fiber produced after July 31 for any purpose other than the manufacture of chemical cotton pulp.

Under the amended order, all producers of cotton linters must accept all orders from pulp manufacturers and must fill them in order of receipt without regard for preference ratings. Importers of linters are likewise covered in the same manner as producers. The Director General for Operations may specify how linter producers' mills shall be operated, so that each producer will turn out the maximum amount of the type of linters and fiber most urgently needed in chemical cotton pulp manufacture. Producers of cotton linters, hull fiber, and motes are required to file Form PD-110 (revised August 1, 1942) with WPB on September 5 and the fifth of each month thereafter.

Lithium Compounds. A complete allocation system for lithium compounds will be instituted, starting September 1. Order M-191 provides for monthly requests for lithium compounds on Form PD-585 and reports from producers on PD-586. Deliveries of 25 pounds or less in any month are exempted from restrictions of the order.

Xylol and xylol range aromatic materials derived from coal tar are brought under control of General Preference Order M-150 by Amendment 1. The original order, restricting sale and delivery of xylol and xylol aromatic materials to orders bearing preference ratings of A-2 or higher, originally defined these products as ". . . of petroleum origin". To remove the resulting commercial inequalities that arose between the petroleum and coal-tar producers, the definition of aromatic petroleum solvents in the original order is changed by this amendment to include the xylol and xylol range aromatic materials made from coal tar as well as the petroleum derivatives.

Price Regulations

Antifreezes. A separate maximum retail price of $1.00 per gallon for Zerone, an antifreeze liquid manufactured by E. I. du Pont de Nemours & Co., Inc., has been established by the Office of Price Administration in Amendment 1 to Maximum Price Regulation 170. The amendment also broadens the definition of type P antifreeze as contained in the regulation. The regulation limited this type, which is permanent, to antifreeze containing at least 85 per cent of ethylene glycol. The amendment permits the type P designation to be applied where part of the ethylene glycol is replaced by ethylene glycol homologs or polyethylene glycols, so long as the ethylene content is not less than 60 per cent by weight. Certain posting and marking requirements are also changed.

Color Pigments. Maximum prices for chrome yellow, chrome green, molybdate orange, and zinc yellow color pigments, which were reduced by amounts varying from 0.25 to 0.5 cent per pound by the General Maximum Price Regulation, have been allowed to return to the levels of April 1, 1942, in Maximum Price Regulation 180.

Core Oil, a binding component in sand molds used for making castings, is excepted from provisions of the General Maximum Price Regulation in Amendment 17 to Supplementary Regulation 1. Manufacturers were finding it difficult to continue under the price ceiling on core oil, and the product is an absolute essential to the war effort. Major ingredients of core oil—linseed oil (50 per cent) and naval stores (25 per cent)—are already excepted from price control. Thus, core oil manufacturers have found it increasingly

difficult to continue operation under the maximum prices.

Fats and Oils. In a sweeping revision of the fats and oils price structure, Price Administrator Leon Henderson has taken four steps to facilitate orderly and normal marketing of imported vegetable oils, tallows and greases, and marine animal oils and for adjustments in contracts with the United States or any of its agencies. This establishment of dollars-and-cents ceilings will not affect the consumer level on fats and oils.

The four steps were as follows:

(1) Fixed specific maximum prices on 19 different imported vegetable oils.
(2) Adjusted price differentials between various grades of tallow and greases; then "rolled back" these newly adjusted prices on inedible tallow and greases about 1 cent per pound to relieve the raw material squeeze on soap manufacturers, who previously had voluntarily cut their soap prices.
(3) Set dollars-and-cents maximum prices on six different marine animal oils and one processed marine animal oil.
(4) In order not to impede the war program, made provisions for adjustments in maximums established by Revised Price Schedule 53, where contracts with the United States, or any agency thereof, or a subcontract under such contract, are involved.

These changes are made in Amendment 6 to Revised Price Schedule 53. Previously, imported vegetable oils—on which dollars-and-cents maximum prices now are set—were covered by the schedule at the individual seller's top price as of October 1, 1941, or 111 per cent of his November 26, 1941, price.

Pine Oil. Prices for natural and synthetic pine oil have been rolled back to the levels prevailing in October 1941. There has been a substantial gap between the supply and the demand for pine oil, which has exerted a tremendous upward pressure on the pine oil market. As a result, according to Price Administrator Henderson, a minority of producers advanced their prices prior to March 1942 to uneconomically high levels. Therefore, it was found advisable to establish prices for most grades of pine oil by a specific regulation.

The specific dollars-and-cents maximum prices established by the regulation—Maximum Price Regulation 179—apply to three classifications of pine oil: basic pine oil, natural alpha terpineol, and light gravity pine oil. The ceiling prices established for these grades is the price at which 80 per cent of them sold during October 1 to 15, 1941. Although specific maximum prices are established for the various grades, it is also provided that no one may sell pine oil for more than his maximum price established by Section 1499.2 of the General Maximum Price Regulation.

B3 reagent grade of pine oil manufactured by the Hercules Powder Co., and synthetic beta pine oil manufactured by Newport Industries, Inc., are specifically exempted from the schedule and continue under the provision of the General Maximum Price Regulation.

WPB Appoints Chemical Advisory Committee

APPOINTMENT of a committee of distinguished American chemists and chemical engineers to advise the Government on technical processes has been announced by Ernest W. Reid, chief, Chemicals Branch, WPB.

Work of the committee will be to pass upon the relative merits of competing chemical processes involved in the war effort. The basis upon which the findings will be made will be (a) which process can be placed in production soonest and (b) which uses the smallest amount of critical materials.

It is difficult under the present war economy, Dr. Reid explained, to obtain unbiased, factual testimony as to which of a number of proposed chemical methods is best. Each new process has its adherents and in most instances each has its own good points. The advisory committee will evaluate each process in the light of the war program and will recommend adoption of one or another.

The committee is headed by Donald B. Keyes, head consultant to the branch and professor of chemical engineering at the University of Illinois. Members are: Marston T. Bogert, Joel H. Hildebrand, S. C. Lind, Frank C. Whitmore, Gustavus J. Esselen, Carl S. Miner, Foster D. Snell, Charles C. Brown, Charles R. Downs, Sidney D. Kirkpatrick, and Fred H. Rhodes.

The committee includes three past presidents of the AMERICAN CHEMICAL SOCIETY, four Councilors, and two Directors. All are recipients of honors in the chemical field.

Treatment of Ores for Maximum Recovery Studied

SEEKING the most efficient method of treating ores to obtain maximum recovery of precious metals and minerals, the U. S. Bureau of Mines has completed tests on 21 ore samples from nine states. Because many of the samples were complex and did not respond to standard testing methods, the bureau supplemented standard methods with microscopic and spectroscopic examinations.

Dry Milk Plants

FOURTEEN new factories for the production of dry milk are to be built as soon as the WPB gives clearance on materials. Agriculture officials have predicted production of 500,000,000 pounds of dry milk solids in 1942, a gain of 26,000,000 pounds over 1941.

OPA Announces First Commodity Practices Regulation

AMERICAN consumers have been given a guarantee by Price Administrator Leon Henderson that the $500,000,000 they will spend this year on soap will buy at least as much as it does at present and that the quality will not be debased. In the first OPA regulation dealing exclusively with size and quality of a commodity, the Price Administrator set the types of soap now being sold in different parts of the country as minimum standards for the manufacturers. All forms of household soaps are covered, and no reduction in the size of cake or package, or deterioration in the quality, or "serviceability", can be made.

The regulation, Commodity Practices Regulation 1, applies only to manufacturers, but the benefits carry through to householders since the prices that retail stores can charge for soaps are controlled by the General Maximum Price Regulation.

Plant Planned for Liquid Fuel and Lubricants from Coal

A FAR-REACHING study of practical and economical methods for producing liquid motor fuels and lubricants from coal will be undertaken by the U. S. Bureau of Mines, Pittsburgh, Penna., as soon as a new experimental plant just authorized by Congress can be erected and equipped. An appropriation of approximately $85,000 has been made available.

The Fischer-Tropsch method will be investigated with a view to developing means to produce gasoline from the coals of Alaska and the United States. The bureau has been studying a modification of the Bergius process for several years. The experimental plant will have a capacity of about 100 pounds of gasoline per day and will include chemical engineering equipment such as catalyst chambers, pumps, charcoal scrubbers, distillation columns, cracking units, and control instruments. Future plans call for a pilot plant to handle about 10 tons a day and a small plant which can be moved and erected in a short time at little cost.

New Process for Making Butylene Glycol Developed

A SHORT and economical process for making butylene glycol, a relatively rare chemical with several important commercial uses, has been announced by the U. S. Department of Agriculture. The new method, being developed at the department's Northern Regional Research Laboratory, Peoria, Ill., involves the

fermentation of plentiful farm crops, such as corn and wheat. The laboratory is now producing butylene glycol on a pilot plant scale. It may be used in making antifreeze for automobile radiators and in production of commercial solvents. It has a number of industrial chemical applications for war industries.

The laboratory is also studying butylene glycol as a possible link in production of butadiene for synthetic rubber. Considerable interest has been shown by industry in the fermentation process for producing butylene glycol. The major problem remaining is conversion of butylene glycol to butadiene on a commercial scale. Chemists at the Peoria laboratory have succeeded in producing excellent yields of pure butadiene from corn-made butylene glycol in the laboratory, but they have not as yet developed the process to a pilot-plant scale and are not making any definite predictions.

Pilot Plant for Sponge Iron Production Planned

PLANS for an immediate study of the methods of producing sponge iron, an acceptable substitute for scrap iron in manufacturing steel, and for the erection of pilot plants to guide future operations in this field have been launched by the U. S. Bureau of Mines. Funds totaling $600,000 have been made available by Congress under the head of "war prosecution" activities, to develop methods of utilizing untouched iron ore deposits and to assist in alleviating the shortage of scrap iron. Sponge iron is produced directly from iron ore without going through the liquid stage, such as that employed to produce pig iron in a blast furnace. It is adaptable to smaller and less expensive plants than the standard blast furnace installation and produces an iron that is low in carbon. Many sponge iron reduction processes are known to be workable, but none has been applied commercially on a large scale to United States iron ores because the standard reduction methods have produced enough iron in the past.

Helium Production to Be Expanded

HELIUM will be produced in greatly increased quantities to meet expanding wartime needs under a program recently inaugurated by the U. S. Bureau of Mines. Millions of additional cubic feet will flow from the enlarged plant at Amarillo, Tex., being processed from gas produced from government wells now in operation. In addition, a new helium production plant at an unannounced location will be supplied with helium-bearing natural gas from an existing gas line transporting gas for fuel markets. A new congressional appropriation of $4,000,000 to be made available from Navy Department funds will enable the bureau to expand its helium-producing program, not only for the Army and Navy but for medical and scientific uses.

Government Program Enlarged

JESSE JONES, Secretary of Commerce, has announced that the Metals Reserve Company, upon recommendation of the War Production Board, is enlarging its program for the purchase of domestic mercury on the basis of $192 per flask, f. o. b. warehouse New York area, by making purchases not only in New York but also at Ore Purchase Depots already established at numerous points in many western states and by conditionally extending the program to December 31, 1943.

The Synthetic Rubber Situation

For immediate release
Friday, July 17, 1942

RUBBER COORDINATOR Arthur B. Newhall has sent out the following letter on the synthetic rubber situation in response to many inquiries about the present status of the program:

As a result of recent publicity given the synthetic rubber program by radio and press, considerable correspondence has come to this office, both direct and forwarded from other departments of the Government.

The inquirers have asked a wide variety of questions. In the following summary we have attempted to answer these questions in a nontechnical way, with the thought that such a summary may give each inquirer a fuller understanding of the problem than answers to his own particular questions might furnish.

PARAGRAPH ORDERED DELETED BY CENSOR.

The present program has been fixed at this amount, not because we are still searching for methods or processes but because the amount of raw material required to build plants to use any of the processes is limited and the amount allotted is all that can be spared at this time to be taken away from other critical needs in the war program. Confusion arising from the public statements of different proponents of different processes has not in the least detracted from the general policy of going forward with this program to completion at the earliest possible moment.

Buna S, which is a general purpose rubber, is made by a chemical combination of butadiene and styrene. Butadiene can be made from either alcohol or petroleum, and many of the questions regarding the present program arise on account of this fact.

Prior to the declaration of war, petroleum was chosen as the base material from which to manufacture synthetic rubber for three reasons: the more advanced experimental development of the process in this country; the substantially lower cost of production; and the apparent lack of increasing defense demands.

After the declaration of war, comparative costs were not important. Rubber was essential, and speed was the first consideration. Our principal crude supply was cut off. An increased synthetic program was entered into. This program embraced all available alcohol which could be released from other war needs at that time and as more alcohol became available, because of domestic wartime measures, the proportion of alcohol to be used in the program was increased. Thirty per cent of the butadiene included in the present program is being made from alcohol and most of the remainder from petroleum.

When you start a new industry naturally rapid changes take place. This has been particularly true with synthetic rubber and important changes are still going on. As an illustration, at the outset, in spite of its ultimate increased cost over petroleum, the alcohol process required less strategic material for the building of new plants; that is, unless you had to go back and build a distillery to get the alcohol. Already, however, a new and better method has been devised in the use of petroleum, and today the amount of strategic material, whether we start with petroleum or alcohol, is practically on an equal basis.

We hope we have cleared up the matter in your mind. The picture is changing almost daily, but we are satisfied that all who have a part in the undertaking are doing their best to accomplish the one thing in which we know the American people are interested—to be sure that enough rubber is made available, regardless of its source, for carrying on the war effort and supplying essential civilian needs.

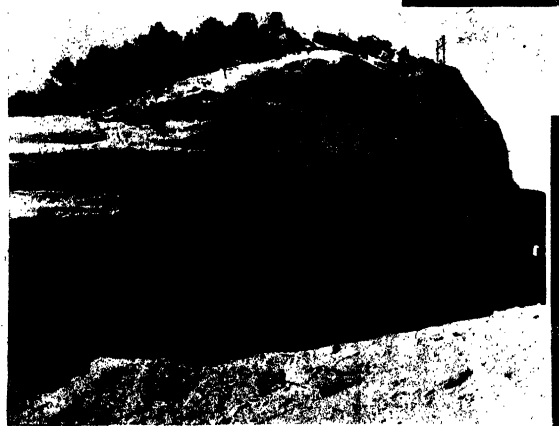
In closing, may we leave this thought with you: Today the program is set as we have outlined. Tomorrow some possible improvement in process or material may appear. If we can use the new, we always will, but we cannot take on the new if to do so would slow up the program. Speed is essential.

Sincerely yours,
ARTHUR B. NEWHALL
Coordinator for Rubber

Blackout Aids

Tenite strips act as tracks permitting the easy raising and lowering of blackout shades and preventing the escape of light around the edges. The strips, extruded of Tennessee Eastman Tenite by Extruded Plastics, Inc., are designed for use in industrial plants as well as in homes. They are distributed by Plastic Products Engineering Co., 500 Fifth Ave., New York, N. Y.

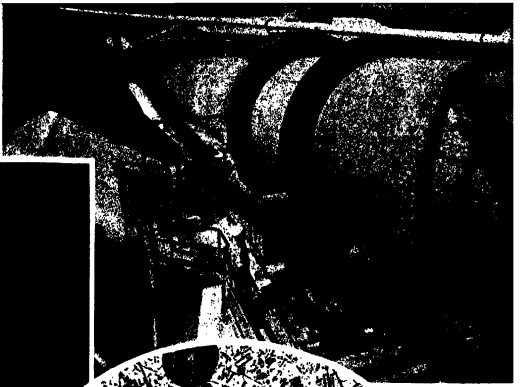
CHEMICAL NEWS PARADE



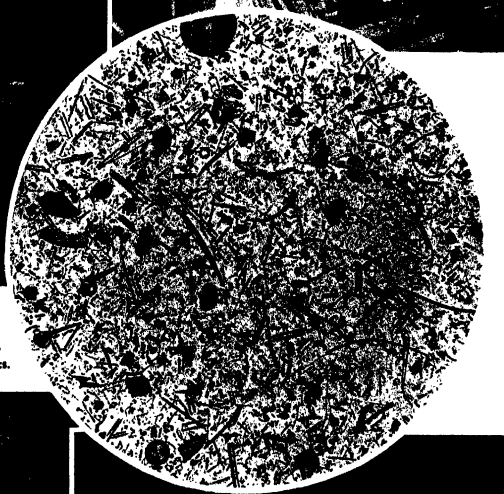
Celite diatomaceous earth quarries of Johns-Manville, New York, are made up almost entirely of accumulated skeletons of myriad billions of tiny sea plants, called diatoms, that were deposited millions of years ago while the hills were part of the ocean bed. Today that 4,000-acre deposit, with roughly 100,000,000 tons of siliceous diatoms, is said to be the largest source in the world of pure diatomaceous earth. *Above.* A huge kiln in which diatomaceous earth is calcined, one step in the manufacture of high flow-rate filter-aids. *Right.* At left a car of pressed brick is being pushed into a drier. At right stand two cars of natural slabs. *Below.* Once the center of a hill, this wall gives an idea of the depth of the deposit, over 1,700 feet thick in some parts.

ROBERT YARNALL RICHIE PHOTOS, LEFT AND BELOW

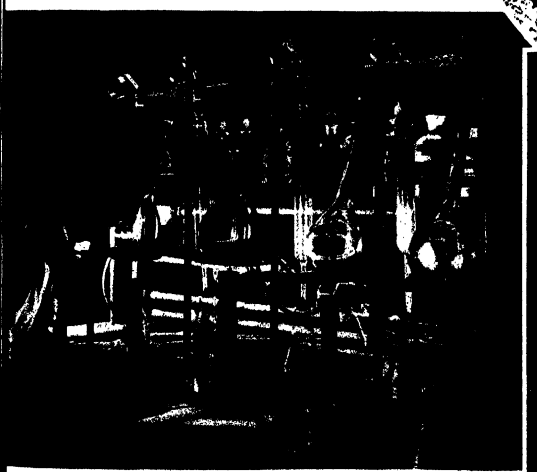
Below. Two mechanical saws cut natural insulating brick from the bank of the quarry slope. The first saw makes vertical cuts at right angles to the face while the second cuts horizontally and vertically, parallel to the face.



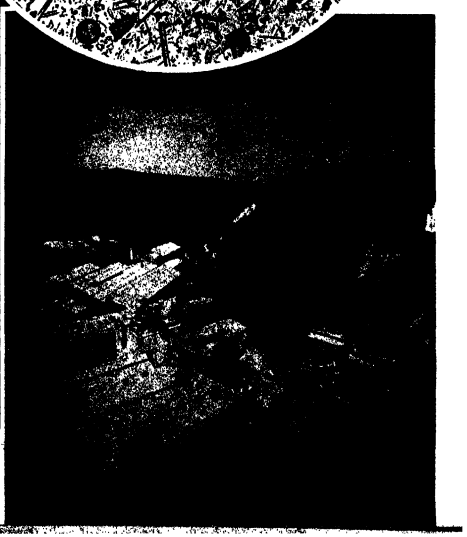
ROBERT YARNALL RICHIE PHOTO, RIGHT



Right. Rotary kilns. *Below.* A train of the electrically operated railroad used to haul raw Celite to the mill from glory holes where it is stored. The deposit is quarried at different levels to provide various grades. Natural brick is used in furnaces against temperatures up to 1,600° F., and after suitable processing against temperatures to 2,500° F. *Below right.* Photomicrographs of Standard Super Cel enlarged to 200 diameters.



ROBERT YARNALL RICHIE PHOTOS, RIGHT AND BELOW



Below. In this control laboratory Celite filter-aids are tested rigorously. *Below right.* The quarries nestle in hills. Uses of Celite include high-temperature insulations, filter-aids, and inert fillers for many substances, such as paint, paper, and plastics.

The latest list is printed on page 601 of the May 10 issue.

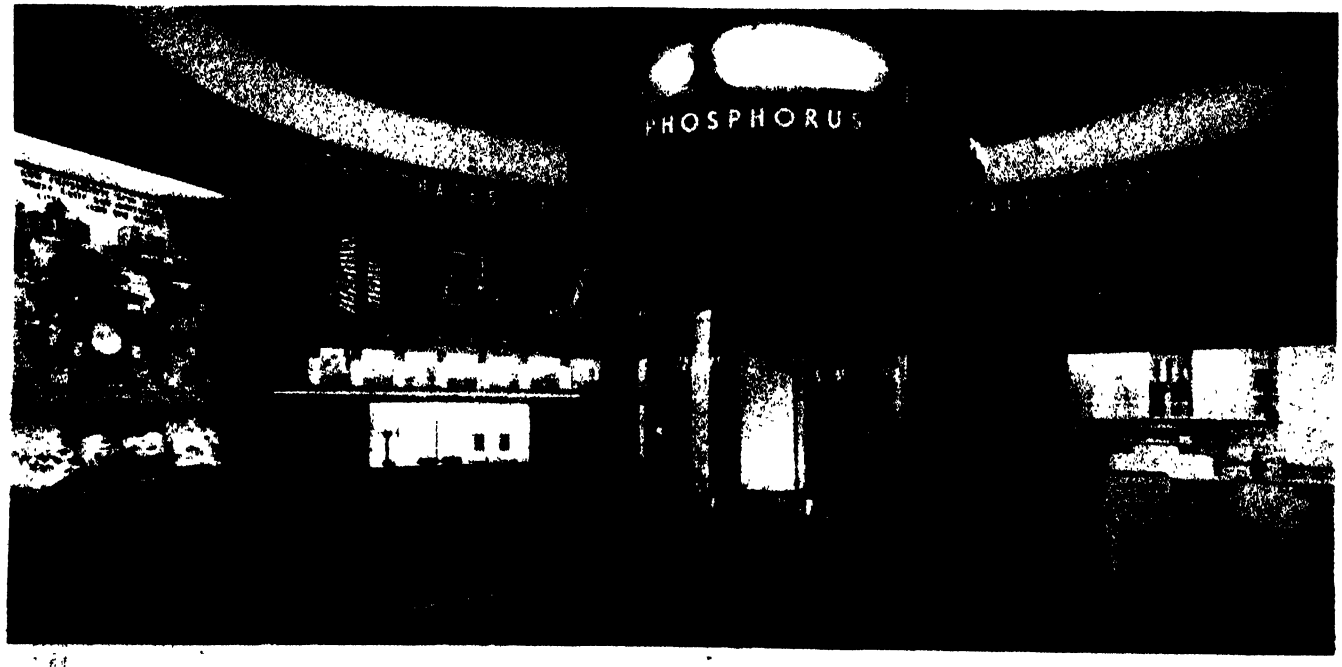

Exhibit Tells Story of Phosphorus

RECENTLY opened to the public in Chicago's Museum of Science and Industry is an interesting exhibit planned and executed under the supervision of the technical staff of the Victor Chemical Works at a cost in excess of $30,000. The exhibit is compactly housed in an ingeniously illuminated circular room. Suspended from the center of the ceiling, a rotating ultraviolet beacon casts an unseen beam upon a fluorescent-painted mural which adorns the upper part of the walls. As the light rotates, succeeding portions of the mural glow momentarily, bringing out dramatically many of the important uses of phosphorus compounds. Directly below in the center of the room is a demonstration platform dominated by two towering glass cylinders. In this glass-enclosed pilot plant, the manufacture of phosphoric acid can readily be observed, a process heretofore hidden within the confines of steel and brick.

Beneath the platform elemental phosphorus is stored within a heat-jacketed reservoir. From here the molten phosphorus is slowly pumped up to the base of the first glass cylinder. Immediately upon exposure to air this extremely active element bursts into flame, combining with oxygen to form phosphorus pentoxide (P_2O_5), a gray smoky cloud that completely fills the Pyrex cylinder. Suction draws this cloud of phosphorus pentoxide through a glass connecting tube to the second cylinder which serves as a water spray tower. Here the phosphorus pentoxide unites with water to form phosphoric acid (H_3PO_4). About a pound of phosphorus is consumed daily in the continuous operation of this miniature plant.

On the far side of the room a large, animated production diagram extending from ceiling to about waist level, tells the story of phosphorus from raw phosphate rock to its ultimate conversion into a host of phosphorus compounds. Beginning at the top, model steam shovels in simulated action load phosphate rock, gravel, sand, and coke into a tiny cintering plant. The subsequently fused mixture is then brought by belt conveyor to an electric furnace where liberation of the gaseous phosphorus at temperatures above 2700° F. is vividly portrayed.

Continuing down the animated flow sheet, the gaseous phosphorus proceeds to the condenser, thence to a storage tank. From here phosphorus is pumped to a miniature tank car symbolizing an actual shipment to an industrial user. A

second pipe line leads to the burner, hydrator, and precipitator house where the elemental phosphorus is converted into phosphoric acid, a repetition of the process demonstrated by the pilot plant in the center of the room.

From either side of the animated production diagram, phosphoric acid flows to illuminated colored translites which line the adjacent walls of the room. Each pictures an important use of one of the many well-known phosphatic salts subsequently made from phosphoric acid. Beneath the colorful translites, button-operated models illustrate by actual demonstration other important uses of phosphate compounds--how wood, paper, and textiles become flame-resistant when treated with ammonium phosphate, how salt remains free-flowing when filled with tricalcium phosphate, how phosphoric acid prevents steel from rusting.

Other dioramas dramatically portray the story of chemical leavening where tiny bubbles of carbon dioxide gas can be seen expanding within the cross section of a magnified muffin. Another illustrates the importance of calcium and phosphorus in building strong, healthy bones, teeth, muscles, and nerves. Last and by far the most imposing is a full-sized kitchen complete with stove, sink, refrigerator, and the many products used by the housewife. While the background blacks out, biscuits in the oven, baking powder on the table, soap powder, matches, beverages in the ice box, salt, and many other items in which phosphates of one kind or another play an important part, all glow vividly in the unseen rays of an ultraviolet light.

The exhibit of the Victor Chemical Works is worthy of inspection by technical expert and layman alike.

University of Illinois Receives Research Gifts

GIFTS for research to the University of Illinois from industry and private organizations totaled $343,340 for the year ending June 30, 1942, according to a recent announcement, bringing the five-year total to $1,337,937. The gifts provide funds for specific research covering a wide range of projects. The largest single donor was the Rockefeller Foundation, which allotted nearly $40,000 for four projects involving a study of amino acids, development of neurology and neurosurgery, teaching psychiatry, and spectroscopic analysis of water.

Inorganic Fellowships Offered at University of Florida

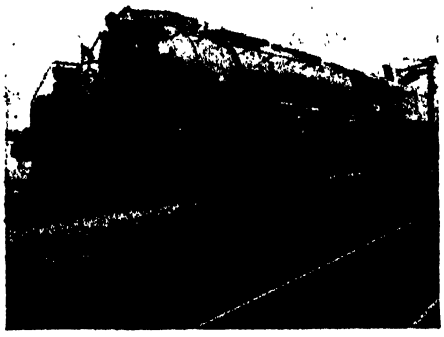
THE University of Florida is offering two fellowships for graduate students in the inorganic field. These fellowships pay $450 with breakage fees, but small university fees must be paid. Further information is available through Fred H. Heath, Department of Chemistry, University of Florida, Gainesville, Fla.

Method for Fire-Resistant Rubber Patented

FIREPROOF rubber can be made from chlorinated rubber mixed with ordinary rubber and vulcanized in the usual way, it is claimed in Patent 2,286,697 granted to Harold A. Tunstall and Benjamin B. Evans of Gravesend, England. The patent is assigned to W. T. Henley's Telegraph Works Co., Ltd., London. The fire-resistant rubber is designed for insulating electric cables or wires which come in close contact with high temperatures.

Antiknock Gasoline Made from Carbon Monoxide, Hydrogen

HIGH antiknock gasoline can be synthesized from carbon monoxide and hydrogen, according to Patent 2,286,814 issued to Lebbeus C. Kemp and assigned to the Texas Co., New York. Both gases are available in large quantities and can be readily produced. The two gases, in presence of a catalyst, are converted into a mixture of various hydrocarbons, including butanes and butylenes. The butane is isomerized, and the isobutane then reacted with the butylene in the presence of another catalyst to form liquid hydrocarbons, which are said to have a high antiknock value and to vaporize within the range of gasoline.



SODIUM and potassium chromates have been placed under control by the British Indian Government, and sale or disposal of these products in the future will be under the same restrictions as sodium and potassium dichromates and chrome alum.

WITH the Australian match industry undertaking manufacture of chlorate of potash, optimism has been reported in that country that matches may soon be available in prewar quantities.

Tenite Nozzles for Fire Fighting

Tenite nozzle jets, sold by Mul-T-Jet Nozzle Corp., 11 West 42nd St., New York, N. Y., are used on standard fire-fighting equipment. The water is cut into tiny streams that cross one another and break into a fine spray, producing artificial fog at only average pressures. The jets cannot rust or tarnish. Although exceptionally light in weight, they have sufficient strength to withstand any nozzle pressure that can be used on hand lines.

The Finest

THAT SKILL AND EXPERIENCE CAN BUILD

To our Railroads, America pays thankful tribute! They are doing a magnificent job in speeding troop and war material movement. Since pioneer days, our railroads have led the world in quality, efficiency and capacity. They are the finest that skill and experience can build.

But for these railroads—the shops that build locomotives, cars, rails and equipment, there had to be an abundance of water. With amazingly few exceptions, it was Layne who designed and built their Well Water Systems. Layne Wells and Pumps are famed for their high efficiency, long life and low upkeep cost.

Layne Well Water Systems, like our great American railroads are doing a magnificent job. They are standing up to unmerciful treatment—day after day and month after month of continuous full capacity operation. It is in this tragic period of emergency that Layne reliability, skillful design and rugged construction is most appreciated. Thousands of Layne Well Water Systems are serving railroads, factories, municipalities, irrigation projects and both the Army and Navy. For late catalogs, bulletins, folders, etc., address.

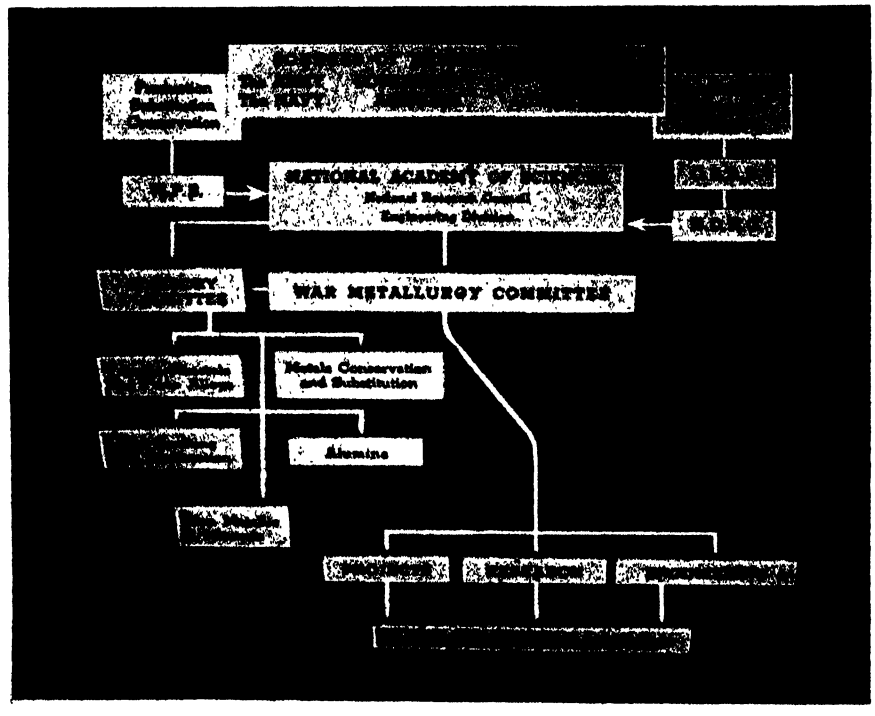
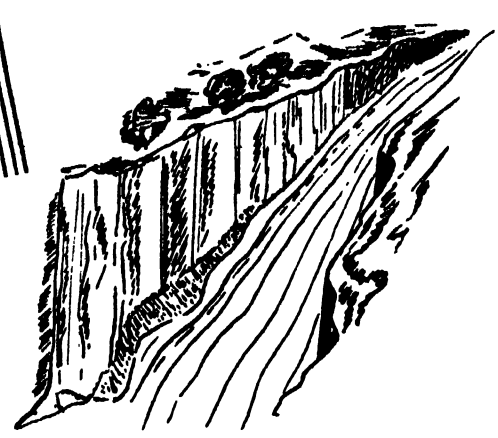
10,000 Scientists to Handle War Metallurgical Research



F. B. JEWETT, president of the National Academy of Sciences, announces that the Academy's Metals and Minerals Advisory Committee for the past 18 months has furnished OPM and WPB with 113 reports. Fifty-three of these were on metals substitution and conservation, 47 on ferrous minerals and ferroalloys, 4 on tin smelting and reclamation, and 9 on nonmetallic minerals. These reports, prepared by the various subcommittees of the Advisory Committee, dealt principally with problems arising from the necessity for allocation and substitution of materials, not only for general civilian uses, but even more particularly for war production processes and increased production of war materials.

The work of this Advisory Committee according to Dr. Jewett, has been greatly enlarged since Pearl Harbor and is to be further increased as it functions with and for the new War Metallurgy Committee. Clyde Williams, director of Battelle Memorial Institute, Columbus, Ohio, and chairman of the Advisory Committee, is also chairman of the new War Metallurgy Committee which has primarily been set up to appraise and conduct needed research work for the Army, the Navy, and other governmental departments as well as industry. This committee is composed of 26 members, the Advisory Committee of 63 regular members, plus special members, and 20 other specialists frequently are called in for advice on specific problems. Associations and technical societies are also taking an active part in the problems of metallurgical reports and research.

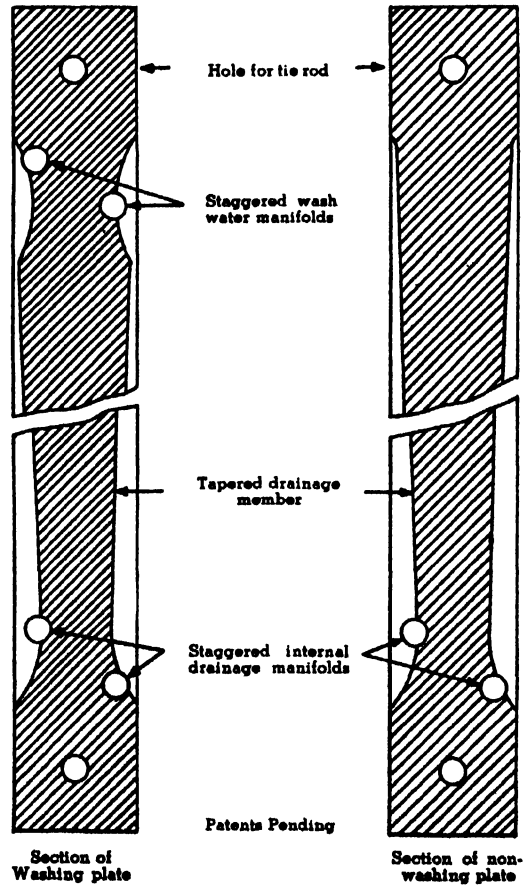


It is the function of the War Metallurgy Committee to collect data and information as requested by either the WPB or the Office of Scientific Research and Development, through its National Defense Research Committee, and to plan, present, and supervise definite research projects for either war materials or armaments. The War Metallurgy Committee, and its Advisory Committee, according to Dr. Jewett, is set up to function as the nerve center for all metallurgical research organizations and departments in this country. The heads of any business, university, or research organization can be counted upon by this committee to make available the experience of their metallurgical scientists and engineers or their laboratory data. There are in excess of 10,000 such individuals in this country, and their combined experience represents well over 125,000 man-years.

One of the basic considerations in the operation of this committee is that of saving time, mistakes, and money. When a problem is proposed, through either the WPB or the Office of Scientific Research and Development, immediate action can be obtained by telephone communication with the leading scientists on that particular subject; initial committee meetings are often held within 24 hours, and, if the request is urgent, within the same day a plan of procedure is laid down and submitted.

CONTINUED ON PAGE 978

Filtrate flows freely down the channel of the F-M FREEFLOW Filter Plate without backing up, much as water flows freely down a river with an ever-deepening river bed.



More Freely Flowing Filtrate Means GREATER CAPACITY

And who doesn't want extra filter capacity today . ... extra flow capacity without the necessity of getting additional filter press area?

The F-M FREEFLOW Filter Plate has progressively deepening channels. As filtrate flows in through the cloth, it finds room in which to flow — such as tributary streams find room in an ever-deepening river bed. The flow doesn't back up as it tends to do in plates with channels of uniform depth.

We can make shipments from stock. F-M FREEFLOW Plates come in many sizes and fit all standard presses. Choice of several different woods and Bakelite.

10,000 Scientists to Handle War Metallurgical Research

CONTINUED FROM PAGE 976

Everyone in this country, and scientists and industrialists are no exception, is naturally anxious to contribute everything he can toward winning the war. New thoughts, new ideas, new short cuts, are constantly coming to the front. While it is not the place of the War Metallurgy Committee, according to Dr. Jewett, to be the repository for such suggestions and ideas, it recognizes as a very definite part of its wartime job, the appraisal of such of these problems and possibilities as are referred to it by the WPB or the Office of Scientific Research and Development.

Another important function of the War Metallurgy Committee is to digest and make available to those properly interested through their participation in the war effort the results of both Canadian and English metallurgical research. Obviously both Canada and England have a great many of the same problems which confront us, and the interchange of information makes available to all the best thinking and practice of scientists and industrialists on both sides of the Atlantic.

Typical of the problems referred to this committee is one asking for improvement in welding processes. A subcommittee was immediately appointed, which collected all available known data from universities, engineering foundations, and research departments of business organizations. The Project Section of the War Metallurgy Committee worked up the research indicated and research procedure; with the approval of National Defense Research Committee and the Office of Scientific Research and Development, this research was placed with one of the university laboratories and compensated for on a cost basis from funds made available by OSRD.

Typical of requests for data and projects from the WPB is that of the effect of substitution of lead-silver for tin-lead soldering of tin cans used for food products. Since tin is the one important metal which is not found in the United States, even in low-grade ores, it is obviously important that the conservation of the present use of tin is urgent. Since a great proportion of the total consumption of tin is used in soldering, the substitution of lead-silver for tin-lead soldering is immediately dictated, but the problems involved in certain canning processes are such that definite research is needed before such substitution can be ordered.

This research project was prepared through the Project Section of the War Metallurgy Committee and will be administered through its research section, the work being done in one large university research laboratory, in cooperation with the National Canners Association.

Full Use of Available Drums Stressed

THE "Drums of War" and ways to handle drums for victory are dramatized in a two-color poster distributed by Commercial Solvents Corp., Terre Haute, Ind. A limited supply of copies is available to companies requesting them. In the national effort to utilize fully the supply of drums, Commercial Solvents is also placing a small label on all 55-gallon drums shipped from its plants. The label carries the same suggestions for use as are listed on the poster:

Roll drums off trucks or loading platforms—don't drop.

Don't rinse empty drums—just replace bungs and tighten securely.

Don't contaminate drums by filling with other materials.

Return drums as soon as empty to production point shown on drumhead.

For victory, make every drum go on as many round trips as possible—as often as possible.

Bausch & Lomb Sponsors Idea Campaign

THE "MacArthur Month" campaign, conducted by Bausch & Lomb, Rochester, N. Y., to stimulate the flow of ideas to save time, labor, and materials and improve manufacturing processes, produced 2,035 ideas in 30 working days. This was at the rate of about 68 per day as against approximately 10 a day received under ordinary circumstances.

Although its regular Suggestion System had always paid liberally for acceptable ideas, the company has paid out a total of $12,374.

Instrument School for Employees Sponsored

A SCHOOL to enable plant and office employees to gain a greater knowledge of instruments, their construction, and use by America's war industries has been established by the Wheelco Instruments Co., Chicago, Ill. Classes are held weekly, with lectures designed to broaden the individual employee's knowledge of an instrument's construction features, beyond the work done in his particular department, and to familiarize him with the instruments used in industry. The course has been planned with preliminary lectures on fundamentals of measurement and control, with later sessions to be devoted to discussions of individual instruments and their uses.

The Furans

Informative Literature *for* Industrial Chemists

Requests for information about the use of Furfural and its derivatives are welcomed. Here are some of the bulletins and reprints, available for the asking, relating to various applications, properties, and characteristics of these chemicals:

The Furans—This 20 page booklet describes Furfural and its derivatives. Uses and properties are discussed.

Furfural as a Selective Solvent—Here is a booklet relating to the application of Furfural for refining in the petroleum industry.

Chemical Resistant Coatings (Bulletin 58)—The finishing of table tops, benches, and other porous surfaces with Furfuryl Alcohol resin is described.

Furfural as a Herbicide (Bulletin 73)—This pertains to weed killers.

Preservative, Fungicidal and Bactericidal Action of Furan Compounds (Bulletin 77)—This is a bibliography listing references to patent and literature articles on subject.

Preservative Action of Furfural (Bulletin 79)—Effectiveness of Furfural is compared with other commonly used preservatives.

Bibliography of Furfural Resin Literature (Bulletin 80)—This is a 17 page list of literature and patent references to resins made with Furan compounds.

Affinity of Hydrophilic Aggregate for Asphaltic Bitumen (Reprint)—Furfural improves adhesion between rock and asphalt.

Thermal Stability of Furfural (Reprint)—Describes effect of heat on properties of Furfural.

Get a sample of Furfural and try it for your purposes. Its wide utility may surprise you.

FURFURAL - FURFURYL ALCOHOL - HYDROFURAMIDE
... TETRAHYDROFURFURYL ALCOHOL ...

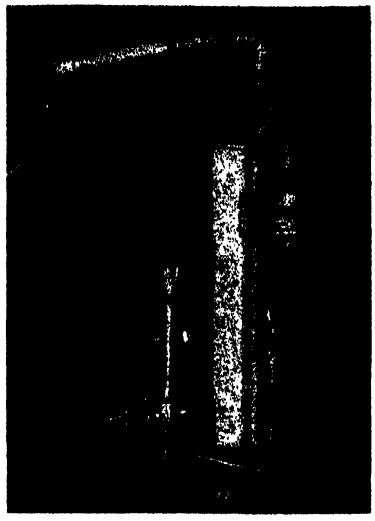
Modern Theories of Organic Chemistry. *H. B. Watson.* 2nd ed. vii + 267 pages. Oxford University Press, 114 Fifth Ave., New York, N. Y., 1941. Price, $5.00.

THE second edition of this survey of recent theoretical aspects of organic chemistry retains the clear, logical presentation which characterized the first edition in 1937. The original 12 chapters have been expanded to 16 partly by subdivision and partly by introduction of new material. The chapters deal with theories of chemical combination; applications of the electronic theory in organic chemistry, strengths of acids and bases, the inductive effect; applications of the electronic theory in organic chemistry, substitution in aromatic compounds; the new physical methods of investigation; kinetic methods; applications of the electronic theory in organic chemistry, general discussion; free radicals; compounds of divalent carbon and allied problems; esterification and hydrolysis; aliphatic substitution; addition to unsaturated compounds; tautomeric change; migrations from side-chain to nucleus and other rearrangements; a review of some stereochemical problems; applications of kinetic methods to stereochemical problems; and stereochemistry of elements other than carbon.

The book can be recommended to students and teachers of chemistry as a good discussion of the above topics. It is not a complete reference work and does not pretend to treat any topic exhaustively. The material has been chosen to give a sound, reasonable presentation which provides a good introduction to this fascinating field of chemistry. The book is well written, edited, and printed.

R. L. SHRINER

Photomicroscopy in Crude Oil Analysis



PHOTOMICROSCOPY, making pictures with a combination camera and microscope, has been employed successfully by U. S. Bureau of Mines chemists to identify and study the tiny brine droplets and salt crystals in crude petroleum which often interfere with the refining process. Designed to supplement the chemical analysis previously used and to provide a visual record as an aid in simplifying the industry's refining problems, the new process is described in a technical paper covering data relating to the physical state of salts in some of the Midcontinent oils, an investigation made in cooperation with the State of Oklahoma. Detailed descriptions of the microscopic phenomena, together with photomicrographs of droplets and crystals, are contained in Technical Paper 638, "Photomicroscopy of Salt in Petroleum", by Lloyd F. Christianson and J. W. Horne, which may be obtained from the Superintendent of Documents, Washington, D. C., for 25 cents.

Booklet on Oxygen Breathing Apparatus

How Long Should A Water Still Last?

Conservation is a problem these days. But if you have a Barnstead Water Still, you have no problem. We know of Barnstead Stills that are producing pure distilled water of the highest grade after fifteen years of constant use. All it takes is periodic cleanings and reasonable care in operation. Barnstead simplifies these requirements by making their stills so that they are extremely easy to clean and operate. If you need operating and maintenance instructions for your Barnstead Still, write to us. Specify the serial number of your still.

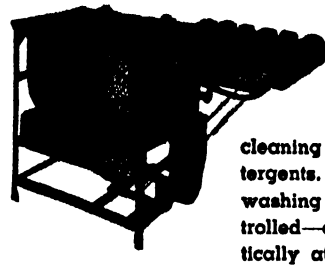
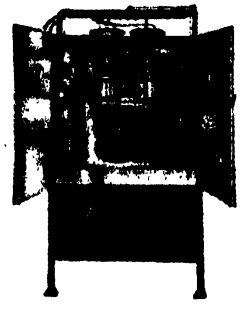
ATLAS-OMETERS

ACCELERATED TESTING EQUIPMENT



ATLAS-OMETERS offer a simple, controllable method of reducing months of actual use conditions to just a few days testing. By accelerating the effect of sun, weather, and laundering, they determine, in your laboratory, how a product will resist sun, washing and weathering. Government requirements for many products specify the use of the Fade-Ometer, Launder-Ometer, or Weather-Ometer.

ATLAS FADE-OMETER



The accepted standard for determining the fastness to light of dyes and fabrics—originated and made solely by Atlas, and now used all over the world. Atlas enclosed Violet Carbon Arc represents closest approach to natural sunlight. Temperature automatically controlled.

ATLAS LAUNDER-OMETER

Standard laboratory washing machine of the A.A.T.C.C. Tests washing action, textile shrinking, staining, and color fastness to dry cleaning solvents, soaps and detergents. All factors, including washing action, carefully controlled—can be reproduced identically at any time.

ATLAS WEATHER-OMETER

Reproduces faithfully the destructive action of sun, rain, heat and cold, with all the attendant phenomena of expansion and contraction. Shows natural weathering effect from any given conditions at any time, any location. Newest Weather-Ometer has twin arcs, for faster testing.

a vital role in saving valuable property and in protecting the lives of men engaged in wartime production of minerals, has been published by the U. S. Bureau of Mines. The book contains information on the construction, care, and use of both the older and newer types of apparatus worn by men in fighting mine fires and in rescuing persons overcome in mines because of insufficient oxygen or harmful gases or in entering underground workings for exploratory or other purposes when they contain toxic or irrespirable gases. Copies of the 234-page publication may be obtained from the Superintendent of Documents, Washington, D. C., for 35 cents per copy.

Salvage Collection

How an industrial concern enabled its home community to establish a record for the collection of war-use salvage is told in a brochure issued by the Lukens Steel Co., Coatesville, Penna. The company planned, launched, and led a drive that yielded scrap totaling 616,065 pounds, 46.68 pounds per capita. Scrap metal, rubber, and rags were sold to local junk dealers, paper was sold to paper mills near Coatesville, while Lukens Steel bought the scrap iron and steel.

New Spectrum Chart Published

Of special interest to teachers of physics, chemistry, and electrical engineering and to practicing engineers and scientists is a new seven-color wall chart of the entire electromagnetic spectrum recently published by the Westinghouse Research Laboratories. Every part of the electromagnetic spectrum, of practical significance, is analyzed in detail. Emphasis is placed on uses of each kind of radiation. Spectral terms are carefully and simply defined in a special glossary.

The chart, approximately 30 by 40 inches in size, will be sent postpaid for $2.00. Orders should be sent to Publications Section, 6-N-17, Westinghouse Electric and Manufacturing Co., East Pittsburgh, Penna.

Company Publication Simplifies WPB Order

To simplify use of the War Production Board's Conservation Order L-134, Leeds & Northrup Co., 4901 Stenton Ave., Philadelphia, Penna., has issued a single sheet tabulating the company's regularly listed pyrometer parts which come within the scope of the order, showing the temperature and other conditions which now limit the use of each.

Colloid Chemistry

Those acquainted with the various editions will be pleased to learn that Jerome Alexander is compiling the fifth edition of "Colloid Chemistry, Theoretical and Applied". He has again secured the cooperation of a large number of experts in the various phases of colloid chemistry, but as before would be very pleased to have the assistance of those with special interests. Such parties should communicate with him without delay at 50 East 41st St., New York, N. Y. Contributions intended for the volume should reach Mr. Alexander not later than October 1, 1942.

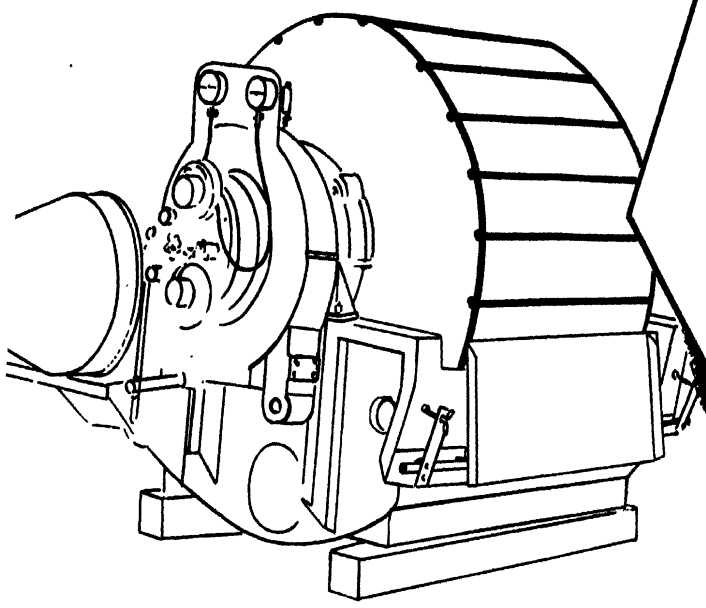
Lecture Data on Incendiaries Available

"Incendiary Materials", an article by William E. Caldwell, lieutenant colonel, C. W. S., has been prepared for distribution. Copies are available to anyone who might wish to give information of this type in lecture form. They may be secured from Colonel A. Gibson, C. W. S., Office of Civilian Defense, Washington, D. C.

★ ★ ★ GREAT TO FISH IN
but UNFIT for Industrial Use

Surface waters cascading over rocks and lying quiescent in shaded pools offer an impelling lure to the angler. Even though crystal-clear, however, such water is practically never suitable in its natural state for steam generation, processing or other industrial needs.

Any water from river, deep well or other natural source requires study and treatment before use, to safeguard and prolong the life of boilers and other plant equipment operating under today's heavy demands. The Betz organization of engineers and chemists is trained and skilled in the conditioning of any water for any industrial use. For any plant, however large or small, Betz stands ready to render a complete water service — of consultation, research, design and supervision.



Write for complete information, giving details of your particular problems.

If you are interested in steam purity and its safeguarding by conductivity instruments, write for booklet describing the accurate, rugged low cost Betz Conducto-Bridge.

IN FILTER DRUM CONSTRUCTION

PANELS *instead of Wire Winding on the Drum*

OLIVER *Panel Type* FILTER*

This filter, already operating with excellent results in a number of large plants, is designed to handle pulps which will not form a thick cake — for example, pulps of a sticky, colloidal nature. A Continuous drum filter with wire wound deck cannot properly discharge a cake which, in thickness, does not exceed the diameter of the wire winding. By contrast the OLIVER PANEL FILTER will discharge such cakes effectively. An ingenious discharging device, together with slight inflation of the cloth, does the trick.

Cloths are applied in panel sections, usually not over three panels to a piece. Specially designed division strips hold the cloth firmly in place. Cloth changes can be quickly made. Operating and maintenance costs are attractively low, due partly to low cloth wear and also to the fact that only a few ounces of air are needed for cloth inflation at the line of discharge. The fact that its basic design is OLIVER is vitally important.

The OLIVER PANEL FILTER is something radically different in drum filter construction and operation. It does successfully what no wire wound drum filter can do — namely, handle thin, sticky cakes successfully. It was designed to do this and does do it.

If the pulp you are handling is of this nature, investigate the OLIVER PANEL FILTER. It should enable you to cut your filtration costs and improve washing results.

The OLIVER PANEL FILTER supplements but does not supplant the original OLIVER CONTINUOUS FILTER with wire wound drum.

* Numerous patented features.

Send items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

Do you have trouble getting a sufficient number of your members out for meetings? Does the problem of a social hour after your meetings seem an unsurmountable one? Are you stumped for entertainment when a visiting speaker is accompanied by his wife? Do you hesitate to plan a social outing because the wives of your members are not acquainted with each other? If so, the Louisiana Section suggests a happy solution for all these difficulties through the formation of a Ladies' Auxiliary.

The Ladies' Auxiliary of the Louisiana Section of the AMERICAN CHEMICAL SOCIETY was founded in February 1939 with a charter membership of 16. At the present time the membership is 44. This percentage increase in itself is an indication of how the project has been received. But this does not tell the whole story. Not only does the Ladies' Auxiliary carry on a most worth-while program, but its activities have proved of both direct and indirect benefit to the section. The attendance curve at section meetings, for example, has gone up owing largely to the fact that both husband and wife have an interest in attending these twin functions which are held on the same night. Cases are on record where a husband has attended a section meeting primarily because his wife did not want to miss a meeting of the Ladies' Auxiliary.

Perhaps the best way to indicate to other sections how such a group functions is to describe briefly how the organization is set up in the Louisiana Section. The constitution of the auxiliary grants eligibility to a wife, sister, or mother of a member of the AMERICAN CHEMICAL SOCIETY. There are four officers—President, Vice President, Secretary, and Treasurer, and the dues are $1.00 a year. The auxiliary has the following standing committees:

Executive Committee consists of the officers and retiring President, who serves automatically for two years on the executive committee following her term of office.

The Program Committee plans programs which are given at the same hour as the section meeting. The programs are held in another room in the same building and consist of book reviews, dramatic readings, and talks by prominent people. Many such programs can be arranged through the State Board of Health, State Conservation Committee, social agencies, and the advertising departments of various commercial concerns. Usually such programs may be obtained gratis.

The Membership Committee obtains the names of prospects through the Secretary of the section and these prospective members are invited to teas or bridge parties, as well as to the monthly meetings. Occasionally a husband becomes a member of the section through the interest of his wife in the Ladies' Auxiliary.

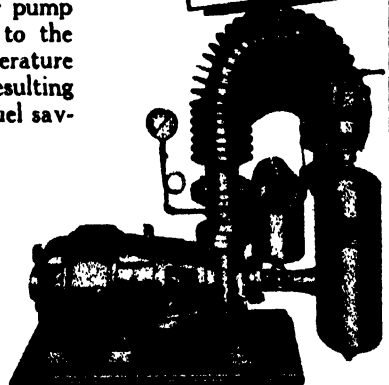
The Publicity Committee performs the function of publicizing the meetings of the auxiliary in the local newspapers.

The Hospitality Committee has the specific function of entertaining the wives of any visiting speakers to the section.

The Entertainment Committee plans social functions that are given with the idea of having the members of the auxiliary become better acquainted.

The Refreshment Committee prepares refreshments for both the section and auxiliary membership for the joint social hour which is held in the meeting room of the auxiliary after the monthly programs of the section and auxiliary. The cost of the refreshments is defrayed by the section and quite frequently the auxiliary obtains free refreshments through contacts with

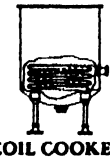
better production . . . through FASTER HEAT



Speed up your boiling time in process through prompt and thorough removal of condensate and automatic and continuous separation and removal of entrapped air by the positive Cochrane-Becker closed circuit system . . . eductor pump returns condensate to the boiler at high temperature and high pressure resulting in faster heat and fuel savings up to 28%!

For higher quality, increased production and lower cost—the C-B system sets new standards of drainage efficiency. Write for Publication No. 3025.

COCHRANE CORPORATION
3147 North 17th Street
Philadelphia, Pa.



Plant operators everywhere have found this system provides:

1. Hotter—more uniform heating
2. Increased production capacity
3. Improved quality
4. 1% fuel saving for every 11° gained
5. Increased boiler capacity
6. Less make-up water

Cochrane COCHRANE BECKER SYSTEM

The Cochrane-Becker system can improve results obtained from this kind of equipment

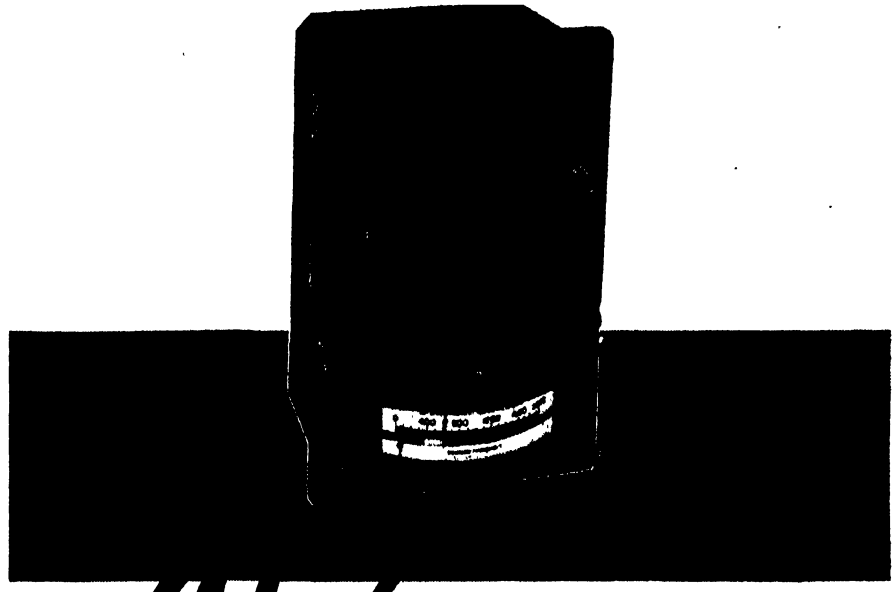
DRYERS

the advertising departments of various local concerns.

In addition to the above committees, the Ladies' Auxiliary on October 15, 1941, formed its own Red Cross unit working in conjunction with the American Red Cross. This unit keeps its own register, record of members, hours worked, and garments sent in to Red Cross headquarters and makes a monthly report at its own business meetings. Many of the members are working in Civilian Defense activities.

The Louisiana Section urges that, if you do not already have a Ladies' Auxiliary in your section, you waste no time in organizing such a valuable adjunct.

A. WATSON CHAPMAN, *Louisiana Section.*

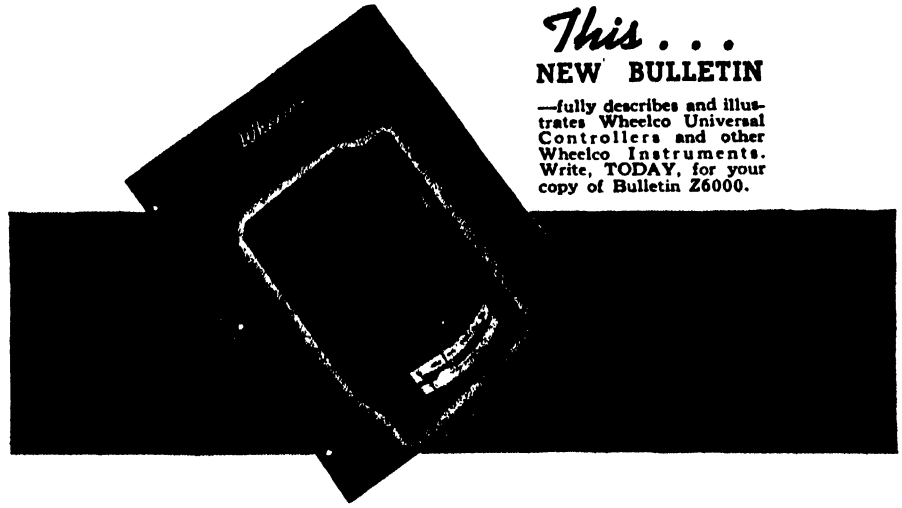


Government Loans to Students

THE Government is to make loans to more than 10,000 college men and women seeking technical or professional degrees in six specified fields, to make sure that their education is completed in the shortest time possible and applied to the war effort. Congress has provided $5,000,000 for training in engineering, physics, chemistry, medicine (including veterinary), dentistry, and pharmacy. Loans will be made to students registered in accelerated programs, whose technical or professional education can be completed within two years, who agree in writing to participate in accelerated programs of study and to engage, for the duration of the war in which the United States is now engaged, in such employment or service as may be assigned by officers or agencies designated by the chairman of the War Manpower Commission.

Old Rubber for Reclaim

Al Costello, employee of B. F. Goodrich Co., examines part of a 70-year-old shock absorber that Goodrich reclaimers say is the oldest rubber product they have ever seen which has reclaim value. Two parts of the product were contributed to the national scrap rubber drive by William E. Daywalt of Tiffin, Ohio. The date the shock absorber was manufactured is clearly branded in the rubber.



Only Wheelco UNIVERSAL Temperature Controllers can give you:

1. "Electronic Principle" Control, *plus*
2. Extreme accuracy of temperature measurement, *plus*
3. Interchangeability of all component parts, *plus*
4. Interchangeability of scale ranges, *plus*
5. Ready accessibility of all parts for individual checking, *plus*
6. Setting devices which may be mounted and locked within the instrument case as a precaution against sabotage.

Wheelco UNIVERSAL Controllers include Capacitrols, Potentio-trols, Limitrols and Resistance Thermotrols.

Wheelco UNIVERSAL Controllers have unlimited applications for indicating, measuring and controlling temperatures. For complete information on these instruments write for free bulletin.

This . . . NEW BULLETIN

—fully describes and illustrates Wheelco Universal Controllers and other Wheelco Instruments. Write, TODAY, for your copy of Bulletin Z6000.

Uruguay Increases Demand for Carbon Tetrachloride

Increased Uruguayan demand for carbon tetrachloride is reported through semi-official sources. Comparatively small prior to 1939, increasingly extensive use of the product in making sheep remedies has led to a rise in imports—190,400 pounds in 1940, compared with 99,600 pounds in 1939, and substantial gains in 1941.

Minute Man Flag to Foxboro

Alfred C. Sheehy, deputy state administrator of War Savings Staff for Massachusetts, presents the Treasury Department Minute Man Flag and Certificate to Irving W. Lane, veteran employee of The Foxboro Co., Foxboro. The company has over 95 per cent enrollment in pay-roll allotment plan for war bond purchases.

PROFITS
THROUGH pH CONTROL

If you are now controlling the pH of your processes you can benefit from the increased speed, accuracy, and versatility of the Beckman INDUSTRIAL MODEL pH METER. If you are not controlling pH, a letter outlining your production processes and problems will bring helpful information on how you can speed up operations, reduce spoilage, increase profits, and obtain uniformly superior products with this accurate simplified meter. This service is free and incurs no obligation.

Specify **Florite Desiccant**

For Efficient Dehydration of GASES and LIQUIDS

FLORITE, the new granular drying agent, is now being used successfully for dehydrating natural gas, propane, gasoline, air, nitrogen, carbon dioxide and other gases and liquids where high drying efficiency is required.

It selectively adsorbs 4 to 20% of its weight in water, depending upon the particular application, and is regenerated by heating to 300–350°F. FLORITE is hard, stable, non-corrosive, non-poisonous, and is available in a variety of particle size classifications.

India Investigates Plastics Possibilities

INDIA is actively developing its plastics possibilities based on the possession of a number of raw materials, a consular report states.

Plastic materials have been developed from groundnut seed cake, coffee beans, bagasse, and jute waste. Several products have been developed from oil plastics, while wool substitutes have been produced from certain seed cakes.

British Issue War Standard for Paint

THE British Standards Institution has issued a war emergency standard for red lead ready-mixed paints. However, for special and export purposes the specifications must be used without amendment beyond substitution of white spirit for turpentine wherever possible. For the home market, principal changes from peacetime specifications in the emergency amendment are that turpentine must not be used but replaced by white spirit, other drying oils shall be substituted for either raw, boiled, or refined linseed oil, and suitable extenders of specified emergency types shall be used.

Canada's First Aniline Plant Goes into Operation

CANADA'S first aniline plant, located near Kitchener, Ontario, in a former rubber footwear factory which has been completely remodeled, is in production. The new plant uses the nitrobenzene process, with a number of important modifications. The nitration stage is automatic, and minimum floor space is required. The plant is producing thousands of gallons of aniline per day, with plans also in progress for manufacture of vulcanization accelerators.

Civilian Dye Shades in United Kingdom Cut in Half

SHADES which may be used in dyeing civilian cloth in the United Kingdom have been curtailed 50 per cent in number since 1940, under orders of the Dyestuffs Controller. The depth of coloring likewise has been regulated. In an endeavor to offset such limitations, however, the allowed shades have been given a romantic nomenclature, such as Patriot Blue, Kew Green.

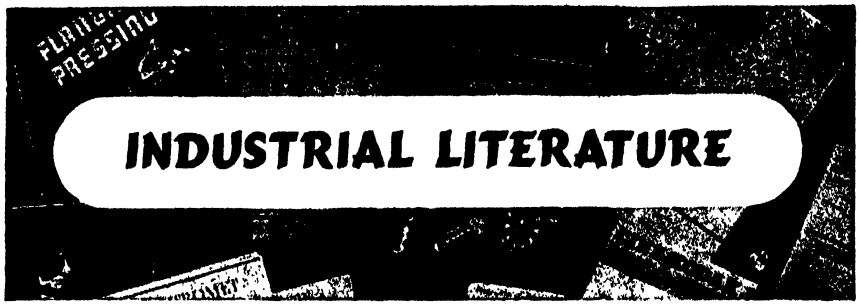
SUFFICIENT formalin to meet essential requirements is anticipated from the output of a formaldehyde plant erected by the Eire Emergency Scientific Research Bureau at Riverstown Distillery in cooperation with the Irish Alcohol Factories, Ltd. Distribution of supplies from this plant already has begun.

One plate of stainless steel if rolled into a plate of Jessop Silver-Ply Stainless-Clad Steel (20% cladding), will make available 5 *times* more stainless surface.

Use of 5% to 50% Silver-Ply Stainless-Clad Steel conserves strategic alloys for the war effort . . . and you still have the desired protection of stainless steel on the clad side, strength from the mild steel backing and better thermal conductivity. It also economizes on material costs with savings up to 45% as compared to solid stainless.

If your operations involve processes where corrosion of equipment must be avoided and product purity must be maintained, Silver-Ply Stainless-Clad may solve your problems, for it is corrosion resisting, stain-free and easy to clean.

Write for descriptive booklet listing applications for processing and storage equipment for use in your specific industry.



* Manufactured under U. S. Pat. Nos. 1,997,538 and 2,044,742

JESSOP

JESSOP STEEL COMPANY
General Offices
WASHINGTON, PENNA., U. S. A.

JESSOP STEELS FOR AMERICA AND HER ALLIES

CARBON • HIGH SPEED • SPECIAL ALLOY • STAINLESS • COMPOSITE STEELS

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Alloys, Ceramics, Synthetics. The expanding activities of this manufacturer in the direction of alloys and synthetics supplement the original business of producing chemical stoneware. In this bulletin the authors present a quick summary of the application of Tygon as well as metal coatings to a variety of process industries' problems. *Bulletin "D" CEN.* The United States Stoneware Co., Akron, Ohio.

Brush Sifters. The application of brush sifters to food, drug, chemical, and allied industries is described in this 8-page bulletin. Some of the units described are simple sifters, while others are combined mixers and sifters. Along with photographs the authors supply specification tables for the principal items in the line. *Catalog 27-A CEN.* Robinston Manufacturing Co., Muncy, Penna.

Conveyors. Package handling problems are dealt with in this 24-page bulletin on conveyors. A 2-page spread devoted to proper selection of conveyors is a working analysis of the conveyor problem. Applications described in this bulletin range all the way from the carrying of small jars to the delivery of heavy bags of chemicals and the movement of oil drums through the plant. *Catalog 307 CEN.* Standard Conveyor Co., North St. Paul, Minn.

Electric Motors. The authors of this bulletin have added to the wartime literature designed to help plant men get longer life and better service out of equipment. This nontechnical book gets over its point with the aid of cartoons but, nevertheless, is full of valuable suggestions. *A Guide to Wartime Care of Electric Motors CEN.* Allis-Chalmers Mfg. Co., Milwaukee, Wis.

High-Pressure Motor-Driven Pumps. This line of vertical pumps includes simplex, duplex, and triplex types. There are four groups of pumps in the single acting power pump class, each available in nine sizes. The bulletin describes single acting triplex pumps designed to carry pressures from 1,400 to 11,100 pounds per square inch, with a capacity range from 3.68 to 22.40 gallons per minute. Four sizes of low volume, double plunger, high-pressure pumps are described. These have capacities ranging from 6,000 to 15,000 pounds per square inch. Capacity and dimension tables, together with well-chosen photographs, make this a useful bulletin. *Bulletin 260-A CEN.* The Watson-Stillman Co., Roselle, N. J.

Horizontal Duplex Plunger Power Pumps. Generous use of line drawings makes this 6-page bulletin a useful data sheet on this type of pump. The manufacturer recommends them for high-pressure hydraulic service for pipe lines and oil refineries. *Bulletin W-412-B40 CEN.* Worthington Pump and Machinery Corp., Harrison, N. J.

Material Handling. The application of overhead handling to a variety of industrial jobs is illustrated in this newsy type of folder. The illustrations show such diversified work as the serving of dyeing machines, handling of bakery products, and conveying of metal parts for finishing. *Cleveland Crane Graphic Folder CEN.* The Cleveland Crane & Engineering Co., 1129 East 283rd St., Wickliffe, Ohio.

Recording Thermometers. Detailed information on construction and application of this liquid-filled recording thermometer is put together in workmanlike form in a 6-page bulletin. The thermometers are offered for a temperature range from −125° F. to +400° F. *Bulletin T302 CEN.* The Bristol Co., Waterbury, Conn.

Rheostats and Resistors. In addition to rheostats and resistors this catalog includes information on tap switches, chokes, attenuators for a variety of uses in industry. Detailed dimension tables and list prices add to the value of the catalog. *Be Right with Ohmite Catalog CEN.* Ohmite Manufacturing Co., 4835 West Flournoy St., Chicago, Ill.

Rotary Dryers. In this 4-page bulletin the design and construction of this type of dryer is given in summary. The line includes standard single and double shell dryers, and also an injector type dryer which has been more recently developed. Illustrations show the application of the dryer to fertilizer and sewage work. The bulletin also lists dryers in a variety of other services. *Bulletin 18 CEN.* Perkins Dryer Co., Inc., 127 North Dearborn St., Chicago, Ill.

Rotary Positive Blowers. This 20-page bulletin presents details about the advantages of positive displacement blowers, their operating principles, and design and construction features. Characteristic curves are reproduced for one constant-speed operation, multispeed, and variable speed operation. Well-chosen illustrations indicate the suitable types for a wide variety of industrial services ranging from vacuum filtration to the supplying of air for combustion and use of the equipment on water gas machines. *Bulletin 22-23-B-11 CEN.* Roots-Connersville Blower Corp., Connersville, Ind.

Silver Alloy Brazing. In the pages of this bulletin the authors have supplied a simple manual for the applying of Easy-Flo No. 3 silver solder. This is a low-temperature composition conforming to Navy specifications. In the bulletin line drawings illustrate application detail. The authors point out that the use of this method produces high strength, ductile, and corrosion-resistant joints at the low temperature of 1,270° F. *Silver Alloy Brazing of Fabricated Copper Piping Bulletin CEN.* Handy & Harman, 82 Fulton St., New York, N. Y.

Steam-Jet Ejectors. The two-stage ejectors described in this bulletin are manufactured in two general types: condensing and noncondensing. The condensing type has an inter-condenser between stages. The inter-condenser reduces the over-all steam consumption of the ejector by condensing the first stage motive steam and condensable vapors entering the first stage suction, and by cooling the air or noncondensable vapors which must be handled by the second stage. In the noncondensing type the first stage discharges directly into the second stage. The second stage must therefore handle the first stage motive steam and condensable vapors entering the first stage suction together with the air or noncondensable vapors. *Bulletin W-205-B7A CEN.* Worthington Pump and Machinery Corp., Harrison, N. J.

Step Valves. A data sheet is offered describing the function of step valves used in Milton Roy pumps, how it functions in working against pumping pressures up to 20,000 pounds per square inch. Illustrations show typical valve designs and why the double-ball checks used in step-valve construction are claimed to be nonclogging and self-cleaning. *Bulletin 426 CEN.* Milton Roy Pumps, 1300 East Mermaid Ave., Chestnut Hill, Philadelphia, Penna.

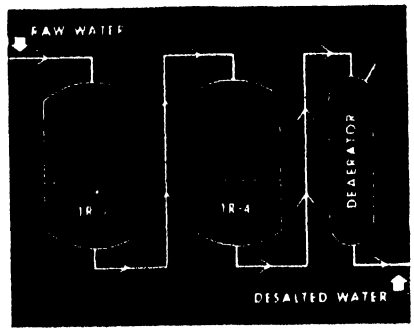
Strainers. The Yarway fine-screen strainer described in this bulletin is made in six standard sizes, ½ to 2 inches. This strainer has three improved features: plating inside and outside for protection against rusting; screen of special Monel woven wire fine enough for straining service but having ample free area; straight thread and machined face on blow-off bushing for easy removal and replacement of screen and for tight joint. *Bulletin S-200 CEN.* Yarnall-Waring Co., Chestnut Hill, Philadelphia, Penna.

Temperature Control Products. This catalog contains condensed information on temperature control products for heating, ventilating, air-conditioning, and industrial applications. It discusses motor-operated valves, control motors, thermostats, humidity controllers, program switches, and accessory equipment which goes to make up the system. *Condensed Catalog CEN.* Barber-Colman Co., Rockford, Ill.

Unibestos Insulation. This bulletin describes the variety of forms and shapes in which this material is available. In addition to information on thermal efficiency and application, the authors have included a table showing the thickness required for various heat insulation jobs. *They'll Specify Unibestos Bulletin CEN.* Union Asbestos & Rubber Co., 1821 South 54th Ave., Cicero, Ill.

Amberlite Ion Exchange Resins

Make an Important Contribution to the Synthetic Rubber Program



★

AMBERLITE Ion Exchange resins are providing a timely answer to the problem of producing pure water economically and in the huge quantities required by the swiftly expanding synthetic rubber industry.

Water passed through beds of these synthetic resins meets the rigid requirements of purity required for the processing of synthetic elastomers since it is equal or superior to distillate or condensate.

Furthermore, the AMBERLITE process makes possible the production of pure water in almost unlimited quantities with a minimum of equipment and space for operations—important advantages in these times when materials for equipment and new construction are at a premium.

AMBERLITE Ion Exchange resins have for several months demonstrated

their practical value in the synthetic rubber processing industry in the operation of a large AMBERLITE unit. Now in full operation, this unit is providing results on a commercial scale that compare very favorably with the theoretical capacity previously determined in The Resinous Products & Chemical Company laboratories.

The synthetic rubber industry is only one segment of the broad industrial field to which AMBERLITE Ion Exchange resins are bringing economics, as well as faster and more uniform production of pure water. Other processes involving emulsions and dispersions offer equally fertile fields for the use of AMBERLITES.

The recovery of metal from industrial wastes, the purification of quality chemicals and dyestuffs, and the softening and desalting of water are but a few of many other branches of the process industries which can profitably use the AMBERLITES.

For further information regarding the AMBERLITE Ion Exchange resins, write The Resinous Products & Chemical Company, holder of the United States patents issued to Adams and Holmes relating to ion exchange resins.

OTHER RESINOUS PRODUCTS & CHEMICAL COMPANY SYNTHETIC RESIN DEVELOPMENTS

Synthetic Resin Plywood Adhesives

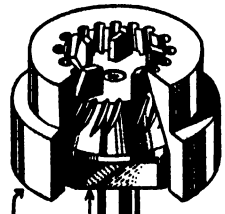
TECO — a phenolic resin film, is the standard plywood adhesive where maximum durability is essential. AMBERLITE — water soluble phenol formaldehyde resin adhesives, and UFORMITE — urea formaldehyde resin adhesives, cover a wide range of applications in the plywood industry.

Synthetic Resins as Coatings

AMBEROLS (modified oil-soluble phenol formaldehyde resins) paved the way for the modern, quick-drying varnishes. DURAPLEX alkyd resins, UFORMITE urea formaldehyde resins, and ACRYLOID polymers of acrylate and methacrylate esters have extended the use of synthetic resins in paints, varnishes, lacquers, printing inks, coated fabrics, and floor coverings, and are now being used extensively to speed our victory program.

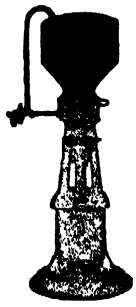
Resin Emulsion Paints

The use of alkyd resin emulsions as clear coatings, primers, and — in pigmented form — as paints, has resulted in coatings requiring no volatile solvents. This emulsion, AQUAPLEX, is the base for quick-drying paints.



Paraplex Resins

PARAPLEX resins are tough, rubbery products of varying softnesses, outstanding as resin plasticizers for nitro-cellulose and ethyl-cellulose.



THE RESINOUS PRODUCTS & CHEMICAL COMPANY

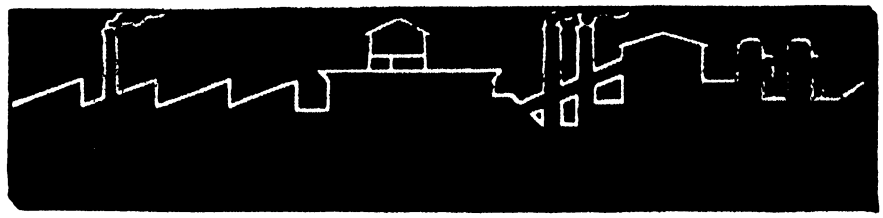
Original design of rotor and stator in

EPPENBACH COLLOIDAL MILL assures more efficient triple action.

AMAZING RESULTS have been achieved with the Eppenbach Colloidal Mills. Products, as wide apart as emulsions, serums, lipsticks, rubber compounds, have acquired new, improved qualities, because the Eppenbach is so far ahead in its triple action.



It's more powerful, the mixing turbines break liquids more violently. Clearances can be so finely adjusted, they seem practically closed. The teeth in the rotor and stator shear the materials mechanically—then the smooth surfaces hydraulically shear to any required particle size.

Perfect control is assured. No air is sucked in. Micrometric adjustments are made without stopping. Water jackets provide right temperatures. Rotor is only moving part—and it's conically shaped to take up wear. Self-cleaning, simple, rugged. *Write us.*

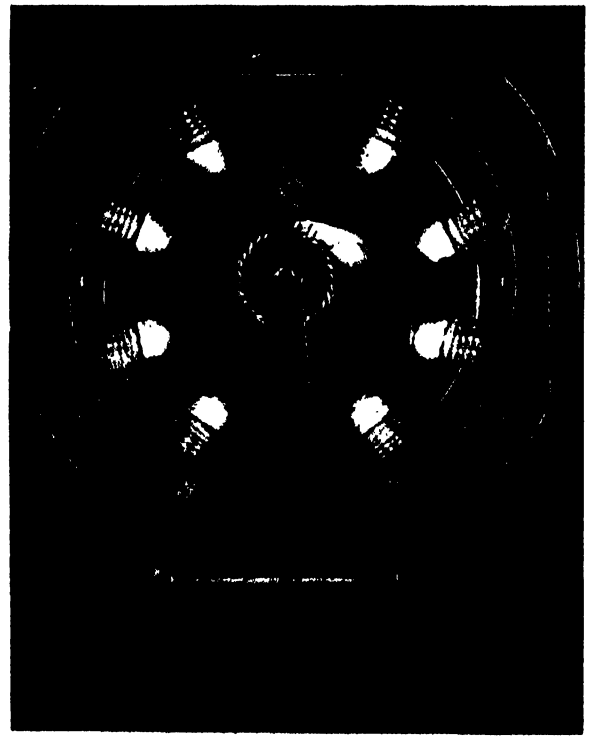
EPPENBACH INC.

PROCESSING EQUIPMENT FOR OVER 29 YEARS

[illegible] Blvd., Long Island City N.Y.

Wood-Moisture Determination

THE speedy and accurate determination of moisture content in wood, by the dependable electrical resistance method, is provided by the Model MB-L megohm-bridge with standard pin-type electrode, recently developed by Industrial Instruments, Inc., 156 Culver Ave., Jersey City, N. J. This instrument supplies direct readings in moisture-content percentage terms for meeting specifications covering precise condition of lumber, as called for by the Army, Navy, furniture manufacturers, and others.



This simplified wood-moisture tester is a modified wheatstone bridge using a cathode-ray electronic tube as the null or balance indicator. The combination switch and control knob is rotated until the null indicator flashes, at which point moisture content is read directly on the dial. Since the bridge circuit is self-compensating, there are no variables to contend with or compensate for such as voltage fluctuations or varying tube characteristics.

Portable Floodlight

A PORTABLE battery-operated floodlight has been announced by the Illuminating Laboratory of the General Electric Co., Schenectady, N. Y., especially for combustible areas which cannot have installed lighting. This unit is intended for use in such places as powder igloo interiors, powder magazines, freight car and warehouse interiors containing combustibles, and during blackouts and other emergencies.

Infrared Lamps Used for Armature Baking

RADIANT drying lamps, replacing steam heat, have reduced the drying time for 12-inch armatures from 18 to 5 hours in a small industrial repair shop. For this purpose 120 infrared 250-watt reflector drying lamps (type R-40), manufactured by Westinghouse, Pittsburgh, Penna., are arranged in tubular form in two equal adjustable banks. Three 10-kw. sections, each consisting of eight groups of five lamps, permit three armatures to be baked simultaneously or individually. Heating temperatures range between 240° and 260° F. as compared to 185° to 200° F. with steam heat.

Plastic Window Pane

A NEW type window pane of transparent plastic laminated with wire mesh which will withstand the explosion of a 150-pound bomb 8 feet away has been developed for use in military construction and industrial plants in potential air raid zones. The new material was developed by the Plastics Division of Monsanto Chemical Co., St. Louis, Mo., in cooperation with the United States Navy to end the menace of flying glass, which experience in England revealed was one of the chief dangers in an air raid. The panes consist of standard, 16-mesh wire screening sandwiched between two sheets of Vuelite, Monsanto's transparent cellulose acetate sheeting originally developed for fluorescent lighting fixtures.

Electrically Equipped Trucks

THE Clark Tructractor Division of Clark Equipment Co., Battle Creek, Mich., is providing its trucks with full electric equipment for storage battery power, where electric operation seems best fitted to the job. The machines lift from 2,000 to 7,000 pounds, using a hydraulic vane type pump driven by special series-wound motor. The same pump operates the tilting unit, which enables the operator to tilt the load back 10 degrees in 5 seconds for safe riding and tilt it forward 3 degrees in 1 second for tiering.

THE executive offices of Evans Chemetics, Inc., and the offices and laboratories of the Ralph L. Evans Associates are now located at 250 East 43rd St., New York, N. Y.

* Nominal.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

GRADUATE FELLOWSHIPS still available. Large eastern university. Half tuition and $700.00 cash. Recipient may carry nine credit hours of study but must devote half his time to assisting. Young women considered.
Box 22-N-7, Ind. & Eng. Chem., Easton, Pa.

SUCCESSFUL SOUTHERN chemical company desires man for original research work in organic chemistry. Individual will be able to work largely on own initiative, and position offers excellent opportunity. Give full particulars, including draft status.
Box 64-NP-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH ASSISTANTSHIP or graduate student fellowship available at large Eastern Canadian university. New research project. Bachelor degree and preferably one year research experience in organic or biochemistry required. Applications considered from men and women. Give full information, references, and photograph.
Box 80-N-7, Ind. & Eng. Chem., Easton, Pa.

ANALYST for RESEARCH laboratory in wood chemistry, Pacific Coast University, experience in wood chemistry desirable but not essential. Wood, organic, or biochemistry background preferred. Women eligible. $1800–$2000.
Box 20-TP-7, Ind. & Eng. Chem., Easton, Pa.

POST-DOCTORATE research fellowship in physical chemistry at large eastern university. Microcalorimetry of solutions; opportunity for other types of physico-chemical measurements applied to biochemistry. Fellowship renewable. Give details of education, experience, references, etc. $2400 per annum minimum.
Box 28-T-7, Ind. & Eng. Chem., Easton, Pa.

WANTED: RECENT graduate, chemist, with rubber laboratory experience. Class three draft status. Akron district.
Box 39-TP-7, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS—ANALYTICAL and research for established laboratories in the fermentation and beverage field in New York area. Submit details of training, experience, references and draft status if male.
Box 41-TP-7, Ind. & Eng. Chem., Easton, Pa.

WANTED: METALLURGIST capable of overseeing the production of straight carbon and alloy steel castings, acid electric furnace, steel foundry located in eastern Pennsylvania. In reply state age, experience and salary desired.
Box 57-T-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH FELLOWSHIP in organic research or analysis, available in September. Work for advanced degree, majoring in analytical or organic chemistry. Qualifications: B.S. or M.S. with a good grounding in analytical or organic chemistry. Stipend $770 yearly. Send applications to H. B. Hass, Dept. of Chemistry, Purdue University, Lafayette, Ind.

CHEMIST with good basic training and initiative, for work in dye laboratory in conjunction with production dyeing of stock and piece goods. Experience as dyer desirable but not essential. Must have good "color eye" and knowledge of color matching. In reply give full particulars of training, experience, draft status and salary desired. Eastern location.
Box 12-N-8, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST or chemical engineer: Large central power station in Ohio. Recent graduate. Or experience in industrial water work involving electrometric and colorimetric analyses. Give details of training, experience, etc. Minimum salary expected, references and photo.
Box 14-N-8, Ind. & Eng. Chem., Easton, Pa.

GRADUATE TEACHING and Research Assistantships in Chemistry (three) available. Stipend $550, September 15–June 1, from which some fees are payable. 10 hours' course work permitted each term. In applying include snapshot, list of courses with grades, references. E. C. Gilbert, Chairman, Department of Chemistry, Oregon State College, Corvallis, Oregon.

CHEMICAL TECHNICIAN for analytical work in a hospital in Brooklyn. Female preferred. Salary $85.00 per month plus meals.
Box 18-N-8, Ind. & Eng. Chem., Easton, Pa.

FELLOWSHIP fat research available Sept. 1–15. $100 per month with remission of tuition fees and laboratory fees in major department. Applicant with M.S. degree and well trained in organic chemistry. Submit complete data first letter including photograph, draft status, religious preference and transcript to R. Adams Dutcher, Department of Agricultural and Biological Chemistry, Pennsylvania State College, State College, Pa.

WOMAN CHEMIST with some library training and experience. University. Middle Atlantic. Include full details and photo.
Box 25-N-8, Ind. & Eng. Chem., Easton, Pa.

PHARMACOLOGIST or PHYSIOLOGIST for industrial biochemical research laboratory. Man with graduate degree preferred. Give training, experience, and personal data. Send photograph.
Box 26-N-8, Ind. & Eng. Chem., Easton, Pa.

WANTED—GRADUATE Chemist with laboratory and plant experience in paper coating. Location Middle West.
Box 28-NP-8, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL ROUTINE chemists wanted by midwest manufacturer of corn products. Major in chemistry with Bachelor's degree. Preferably male and draft deferred. Starting salary $150.00 per month.
Box 29-NP-8, Ind. & Eng. Chem., Easton, Pa.

POSITION OPEN for a chemical engineer for process investigations. Also position for an organic chemist. Both positions in Research Department of large midwestern distillery operating on defense contracts. Prefer M.S. or better and 3-A.
Box 32-NP-8, Ind. & Eng. Chem., Easton, Pa.

FELLOWSHIP at UNIVERSITY of Michigan provided by Standard Oil Company of California for Graduate training in Chemical Engineering with emphasis on petroleum production. Full academic work may be taken including a research problem beginning October or next February. Stipend $750. Address D. L. Katz, East Engineering Building, Ann Arbor, Michigan.

CHEMICAL ENGINEER, 3 or 4 years experience. Preferable in pilot plant scale work on the production and refining of organic chemicals for research and development work in large kraft pulp mill by-products plant. Location southeast.
Box 57-N-8, Ind. & Eng. Chem., Easton, Pa.

EDITORIAL ASSISTANT on Chemical and Engineering News to do editing, some rewriting, caption writing, proofreading, production details, and general office work. Several years' college training in journalism and chemistry desired, as well as a knowledge of typewriting and preferably of stenography. State qualifications fully and submit photo. Apply to Industrial and Engineering Chemistry, P. O. Box B, Woods Hole, Mass.

MALE CHEMIST with B.S. or equivalent having at least four years experience in formulating pigmented industrial finishes as assistant to technical director, Jones Dabney Company, Louisville, Ky.

MANUFACTURER of SYNTHETIC resins. Phenol & Urea Glues for Plywood, Airplanes, Furniture, etc. Laminating Resins. Wood Impregnating Resins. All to Army, Navy, & Aeronautical Spec's. Desires Sales Representative—comm. basis.
Box 59-NP-8, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMISTS. Inorganic or organic needed by a laboratory that deals with a wide variety of materials. Very large and nationally-known company engaged in War work. Both experienced and inexperienced men will be considered. Applicants should submit educational history, experience, age and a recent photograph.
Box 62-NP-8, Ind. & Eng. Chem., Easton, Pa.

LARGE EASTERN corporation wants applications from Industrial Engineers not now with war industries. Must be graduate of recognized engineering school, 2–5 years' industrial experience.
Box 63-N-8, Ind. & Eng. Chem., Easton, Pa.

MEN & WOMEN—Analyst—junior capacity routine examination raw materials. Well-rounded chemistry training. Some pharmacy interesting. New Jersey. Salary open: —1) *Organic* chemist, 2) *Chemical Engineer*, young, little experience. Excellently rated New York Laboratory. Salary open. *Biochemist*, Ph.D. preferred. Nutrition experience. New Jersey. Salary open. *Organic Chemist*, Ph.D. research. Problem determined by background. New Jersey. Salary open. *Microchemists* and analytical, $28–$40. New Jersey. *Biochemist*, research problem kidney. Endocrine experience. East. To $80. *Men. Director Research & Development*, pharmaceutical manufacturer; physician having this experience. $7000–$8000. *Director*, laboratory, all around training Biological sciences, Chemistry, Pharmacy. Age 30–35, $5000–$10,000. *Production* manager; Jellies, ointments, creams, ampules manufacturing experience; pharmaceutical training. East. $3500–$5000. *Women, Librarian*, medical German and French. American born. Vicinity New York. 5 day week; $45 up. *Bacteriologist*, stenographer. New York City. Salary open. Everett Brown Agency, 17 John St., New York, N. Y. C.

SECRETARY to RESEARCH Director, women chemist able to do shorthand and typing. College graduate. Some knowledge of organic chemistry and German desirable. Salary will depend upon qualifications. Location, New York State. Send details of training, experience, salary expected, and recent photo.
Box 65-N-8, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 994)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

WANTED GRADUATE Chemist with experience in water paste and powder paints.
Box 66-NP-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer with advanced degree wanted for corn products research. Must be experienced in this field.
Box 74-NP-8, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST or Chemical Engineer with engineering and mechanical ability and initiative for individual work. Development or analytical experience in mechanical packings, gaskets, lubricants, plastics or rubber preferred. State fully qualifications and salary desired.
Box 80-NP-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. A leading trade journal has opening on its editorial staff for capable young chemical engineer with ability to write. Must be conversant with petroleum refining processes, petroleum synthetics, and petroleum processing equipment. Would have headquarters in New York. Age preferred 30-35. Give full details, qualifications, training, experience, salary, and personal data including draft status.
Box 82-NP-8, Ind. & Eng. Chem., Easton, Pa.

SALES CHEMIST—chemical firm requires services of chemist or chemical engineer having industrial chemical and sales experience. State full particulars including age and draft position. Send photograph with application.
Box 87-NP-8, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

ORGANIC CHEMIST. B.S. in Ch.E. 1935, age 29, married. Six years' experience in organic synthetics. Product and process development from laboratory to plant production. Desires location near New York or New Jersey.
Box 45-T-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST and BIOCHEMIST, Ph.D., Major Organic. Fifteen years' of research in synthetic organic, enzymes, proteins, carbohydrates, chemistry and physiology of bacteria, mechanism of drug action, immunochemistry. Forty publications, patents. Also several years' research in Europe. Now engaged in biochemical research in a large Eastern University. Desires a change to a responsible position with a progressive group. Imaginative, resourceful. Age 45. Gentile. Please give details in first letter.
Box 41-T-5, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., desires work in research or development. Researches in kinetics, high vacuum, electrochemistry. Now working in radio tube factory, thermionic emission, production development of direct emission filaments. Good background in physics, mathematics. 29, married, English born, American citizen. Phi Lambda Upsilon, publication.
Box 18-N-7, Ind. & Eng. Chem., Easton, Pa.

TEACHER, RESEARCH worker: Ph.D. Majors: Physical chemistry, chemical engineering. Twelve years' teaching these with inorganic, analytical chemistry, metallurgy, microscopy, etc. Sixteen years' industrial research, consulting, testing. Numerous publications.
Box 31-N-7, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. 1942. Vitamins and nutrition. Good foundation in organic, physical, and physiology. Research on B complex and protein requirements. Publications. Five years' teaching biochemistry, general and physical chemistry. Desires research or teaching.
Box 63-N-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. in chemistry. Minor in chemical engineering. 1941 graduate from A.C.S. accredited engineering college. Excellent experience in public relations. One year experience in development and research. Prefers job in organic production. Must be in defense. Presently employed, but available after short notice. Single. Willing to travel anywhere. Phi Lambda Upsilon.
Box 24-T-7, Ind. & Eng. Chem., Easton, Pa.

PH.D. Twenty years' experience in industrial research and development. Some teaching experience. Wish to return to teaching with opportunity for pure research. Excellent record of applied research in colloid chemistry, nutrition and organic chemistry.
Box 29-T-7, Ind & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, eleven years' experience including teaching chemical engineering, chemist in control laboratory, pulp research, gas absorption, waste liquor evaporation and combustion and process engineer in munitions plant, desires responsibility and hard work in the West. Age 37, married, two children.
Box 30-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S., M.S. 1942. A. C. S. accredited college. Organic and Biochemistry. Some industrial experience. Single. Favorable draft status. Position in essential industry desired. Available immediately.
Box 42-T-7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Texas A & M, 10 years' experience in control, plant, and research laboratories of petroleum refineries. Also 10 years' experience in charge of plant operations including vapor phase cracking and the manufacture of gums, resins, solvents, toluol, benzol, and naphthalene from petroleum oils.
Box 34-T-7, Ind. & Eng. Chem., Easton, Pa.

COLLEGE-TEACHING. Ph.D. 1935. Employed. Desires change in position where opportunities in teaching and research are available. Prefer analytical or inorganic. Also physical, organic, chemical microscopy, X-ray crystallography and metallurgy. Nine years' teaching experience. Age 37. Family.
Box 43-T-7, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.A., 1940, Biology and Chemistry Major; two years' graduate work in organic chemistry and biochemistry. Synthetic organic work preferred but am willing to try almost any laboratory work. Single, Protestant, age 24. Eastern states preferred but will consider other locations.
Box 45-T-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST. M.S. 1940. Unusually thorough training in general inorganic, organic fields. Capable of independent research. Three years of industrial experience. Married, Protestant, 29 years of age, 3-A draft. Prefer Southwest or Mountain area, but will consider anything in Western Hemisphere. Available after A. C. S. meeting in Buffalo.
Box 47-T-7, Ind. & Eng. Chem., Easton, Pa.

RECENT B.A. Physiological chemistry: Well-grounded biochemistry, bio-assays, applied physiology, medical, x-ray technology, bacteriology, chemical microscopy, colloids, etc. Prefer to work, learn pharmaceutical-type laboratory or plant but consider others. Excellent personal references. Immediately available. Age 23. 2-A continued if chemist.
Box 78-T-7, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and DEVELOPMENT chemist, M.S. 1930. Successful in directing research and development work for past seven years. Experienced in protective coatings, building materials, adhesives, asphalts and allied materials. Considerable production experience. Married, family, age 36. Location immaterial. Available on short notice.
Box 19-N-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. from leading mid-western university. One year toward Ph.D. Also excellent training in analytical, physical, biological and engineering. Nineteen months with T.V.A. Good references. Desires employment, preferably research. Available immediately, anywhere. Age 24, single good health. Draft 2-A.
Box 20-N-8, Ind. & Eng. Chem., Easton, Pa.

RECENT GRADUATE, B.S. in Chemistry June, 1942; minor in Physics and Mathematics; excellent background in analytical, organic and physical chemistry. Single, age 22, American, Jewish, draft classification 4-F. Available immediately; eastern location preferred.
Box 21-N-8, Ind. & Eng. Chem., Easton, Pa.

INORGANIC and PHYSICAL Chemist desires research or defense position in Rocky Mountain or Pacific Coast Area. Ph.D. University of Minnesota 1930. Eight years' research experience with the Tennessee Valley Authority. Five years' teaching experience. Age 40. Address: Earl F. Ogg, R.R. 2, Coeur d'Alene, Idaho.

ORGANIC CHEMIST, Ph.D., 1941, minors analytical and inorganic. Sigma Xi. Ten years' teaching and research experience. Resourceful and industrious. Married. Age 34. Draft deferred, Class 3-A. Negro. Available immediately.
Box 23-N-8, Ind. & Eng. Chem., Easton, Pa.

WANTED OPPORTUNITY to use ingenuity and intelligence in progressive research. Ph.D. 1940. Excellent training physical and analytical chemistry. Research in surface tension and kinetics. Sigma Xi, Phi Lambda Upsilon, teaching fellowship. Age 31, married, dependents.
Box 30-N-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1933, employed, married, one child, age 33. Nine years' University teaching, two years' industrial research. Experience in pharmaceuticals, organometallics, and sulfur derivatives. Industrial research or academic position desired.
Box 33-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, S.B. M.I.T. 1940. Major organic, graduate courses. Thesis on vitamin D. Two years' experience, original organic and biochemical research. Four publications. Employed, 2-B, available short notice.
Box 34-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S., 1941. Desires position, analytical or otherwise, with plant doing essential war work. Thorough chemical training. Analytical experience in agricultural field. Honor society. Age 23, single, Jewish. Available short notice.
Box 35-N-8, Ind. & Eng. Chem., Easton, Pa.

LICENSED CHEMICAL Engineer. Experience pilot plant supervision, process development and equipment design in organic chemicals manufacture. Married, American. Desires responsible position in manufacture or research. Available one month.
Box 41-N-8, Ind. & Eng. Chem., Easton, Pa.

TECHNICAL MARKET ANALYST Ph.D. 1940. Well rounded graduate training in physical, organic and inorganic chemistry. Limited training in metallurgy. Two years' industrial research experience. Desires position as market analyst for research or technical divisions of well established progressive company. Married, draft status 3-A, Phi Beta Kappa, Sigma Xi. Available on reasonable notice.
Box 37-N-8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH DIRECTOR Ph.D., formerly assistant at Kaiser Wilhelm Institute of Chemistry and University of Paris. 15 years' research experience in organic chemistry, synthetic pharmaceuticals, hormones, alkaloids, microanalysis. Patents and publications. Now director of research industrial laboratory. Desires similar position in large industrial research laboratory or university. Austrian, have first citizenship papers. Married, age 38.
Box 39-N-8, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL ORGANIC Chemist. Ph.D. Nine years' of industrial experience in fundamental and applied research, semiplant operations and technical service on synthetic resins, naval stores and cellulose derivatives. Directing research at present. Trained in chemical engineering and sales. Patents and publications. Age 35, married, one child, Protestant, American, location immaterial. Will consider sales, production or research. Qualified to direct plastic and protective coating program in aviation field.
Box 42-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—chemist B.Ch.E., M.Ch.E. Three years' industrial experience in fine organic field, which includes research and pilot plant development in alkaloids and rubber latex, and large scale production of vitamins. Single, 26, Christian, American. Draft deferred. Location preferred East. Desires permanent position reliable concern.
Box 43-N-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC Ph.D. 45, married, 9 years with organic & 9 years with pharmaceutical industries—also management and patent experience. Would like joining research or development dept. of very active firm.
Box 44-N-8, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING position wanted by Ph.D. Physical Chemistry, 1941. Two years' teaching assistant in large midwestern university. Research publications. Phi Beta Kappa. Sigma Xi. Phi Lambda Upsilon. Age 25. Married. Draft 3-A. Willing locate anywhere.
Box 45-N-8, Ind. & Eng. Chem., Easton, Pa.

PETROLEUM TECHNOLOGIST. B.S. in Ch.E. 12 years' experience in petroleum refining including research, design, and operation, particularly alkylation reaction both of isobutane and benzene. American. Age 34. Married, draft classification No. 3-A. Presently employed. Desire permanent position with opportunity for advancement.
Box 51-N-8, Ind. & Eng. Chem., Easton, Pa.

SANITARY CHEMIST. M.S. Western university, course work toward doctorate; 13 years' experience sewage research, alkalies, explosives, extensive analytical experience. Prefer West, especially Rocky Mountain region. Married, Sigma Xi, deferred. Publications.
Box 52-N-8, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, B.S. Pharmacy, M.S. chemistry. Leading midwestern university. Registered pharmacist. Six years' diversified experience in pharmaceutical industry, particularly analytical control. Now employed, but desire to make change offering greater opportunity, preferably in an essential industry. Honor Societies. Single, draft deferred. Available on short notice.
Box 53-N-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. Four years' experience making synthetic organic chemicals. Two of these years spent in industrial research. Protestant. Married. Draft 2-B. Desires research position.
Box 54-N-8, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST, university graduate. Experienced rubber technology, research and development. Employed. Excellent record. Prefers position chief chemist small company or head new department in company entering rubber field. East or Midwest. Initial salary $4200. Married, dependents.
Box 55-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: ORGANIC and enzyme chemistry major; physical minor. Research completed at A.C.S. accredited university. Publications. Adaptable, independent, willing worker. Draft deferred.
Box 61-N-8, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST with over twenty years' wide experience in the Food Industry, in direction, research, process development, quality control, and factory problems. Desires a responsible position.
Box 69-N-8, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 995)

(Situations Wanted Continued)

TEACHING POSITION, physical or inorganic chemistry, wanted by physical chemist, Ph.D. 1940. Teaching experience inorganic chemistry. Publications. Honor Societies. Age 27, single, draft deferred. Now employed in research, available on reasonable notice.
Box 67-N-8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, A.M. (Physical and Organic). Seventeen years' in research and development including 12 years with prominent Eastern consulting firm, 3 years at leading research institute. Special experience printing inks, colloids, textiles, paper. Especially interested in rheology, microscopy, surface chemistry. Age 41, married, one child. Employed but seeking position with greater opportunities, with reputable firm providing good research facilities and pleasant working conditions. Excellent references.
Box 71-N-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.S. with four years' laboratory experience in organic compounds including synthetic rubber, plastics and surface coatings, familiar with pilot plant operation, seeks position where knowledge can be best utilized. Best references.
Box 72-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER seeking better position. Three years' experience in petroleum research and pilot plant development—mostly alkylation work. Minimum salary acceptable depending upon location of work $3600.00. Available 30 days notice.
Box 73-N-8, Ind. & Eng. Chem., Easton, Pa.

PETROLEUM CHEMIST: Bachelor degree and graduate credits. Now employed; seeking change. Four and a half years' research and development experience on resins; light oil, kerosene and lube oil refining and distillation problems; tar and pitch work. Draft 3-A.
Box 75-N-8, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING desired by young organic chemist, M.S. formerly assistant at large eastern university. Research experience, publications. Available September 1942.
Box 77-N-8, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, 5½ years' research experience in inorganic chemistry. Colloidal and surface chemical investigations in pigment field. High temperature gas reactions and photochemical research. 28 years old, married, draft deferred. M.S. degree.
Box 79-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. 11 years' experience process work, engineering and sales in petroleum refining, organic chemicals and equipment. Desires responsible engineering work in Metropolitan N. Y. or Phila. areas. Draft exempt, 34 years old with 3 dependents.
Box 83-N-8, Ind. & Eng. Chem., Easton, Pa.

Ph.D. in CHEMISTRY, M.S. in Chemical Engineering. Ten years' experience in scientific and industrial research, development, and administration. Specialized in catalysis, hydrocarbon chemistry and lately in rubber, plastics, and asphalt. Desires responsible and active position in research and development, preferably in synthetic rubber industry. Now employed in executive position.
Box 84-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D., wide experience in foods, enzymes and fermentation. 14 years' successful career in plant-management, research and development. Seeking responsible position with progressive concern. First class references. Married.
Box 86-N-8, Ind. & Eng. Chem., Easton, Pa.

UNIVERSITY or LARGE college teaching position desired. Ph.D. Columbia 1942; major, organic; single, 28; draft status 2-B. Now doing industrial research for summer only. Prefer teaching. Location immaterial.
Box 88-N-8, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED (NONMEMBERS)

CHEMIST and ENGINEER 20 years' experience research, management and sales—oils and allied lines, starches, gums and dextrins, animal glues, waxes—research and development on sulfonations, esterifications, synthetic detergents, emulsions, bases for emulsifying mineral oils and fats, resins, textile and paper chemicals, rayon and acetate fibres, water-proofing compounds, abrasives, polishes, adhesives, dry colors, foods and enzymes. M.I.T. graduate. Desires position requiring broad experience in research and production.
Box 10-N-8, Ind. & Eng. Chem., Easton, Pa.

PATENT ATTORNEY. Organic chemist, Ph.D., five years' experience preparation and prosecution of patent applications, excellent linguist, desires connection with patent department or law firm.
Box 11-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. 1938, age 27, experience in petroleum, food, and drug chemistry. Excellent scholastic and employment records. Employed at present, wants position in essential war industry. Draft status 3-A. Location immaterial.
Box 13-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D. many years experience in vegetable oils and fats desires position in production or research.
Box 17-N-8, Ind. & Eng. Chem., Easton, Pa.

SPECTROGRAPH OPERATOR: No practical experience as such, 16 weeks ESMDT training. Industrial Applications of Spectrograph at U.S.C. 18 years' glass and ceramic technology and manufacture. B.S. '09.
Box 38-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 15 years' experience development, design, construction, and management. Fine chemicals, heavy chemicals, gas and by-products, electro-deposition. Available September 1st., 1942.
Box 40-N-8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH SCIENTIST & AUTHOR. Co-operative position wanted; joint owner of patents, with patent applications for water-white pharmaceutical, aviation, and industrial oils, as well as "gaseous motor fuels"; promptly available; seeks further opportunity for co-operative research.
Box 48-N-8, Ind. & Eng. Chem., Easton, Pa.

PETROLEUM CHEMIST, M.S., age 35, married. Ten years' research development and plant production experience on lubricating oils and petroleum specialities. Capable of directing research or supervising plant operations. Employed but available on reasonable notice.
Box 56-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, six years' experience on lubricants, asbestos, cement products, pigments. Desire position in development or production. Graduate courses in Production, Supervision, Organic and Physical chemistry. Age 28, draft classification 3-A.
Box 81-N-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: Fifty-two years. Experience sugar manufacture, petroleum refining, oil cracking development, synthetic resin manufacture and development, industrial analysis. Good with mechanical tools and equipment. Original thinker. At present employed. Would like work that is more varied and interesting.
Box 85-N-8, Ind. & Eng. Chem., Easton, Pa.

Filterstones

CLOSED system filters, made by the Le-Val Filter Co., 1319 South Michigan Ave., Chicago, Ill., use low-cost filter aids instead of filter cloth, paper, or fine metal screens. The patented Filterstones are in the shape of hollow disks and will not give or break through even at high pressures. The stones are supported in the center of the cylindrical tanks and are revolved as they are back-washed and sprayed at the conclusion of a run.

Initial tests for flow rates on an installation of the type pictured for a water-thin highly corrosive product gave 333 gallons per hour per square foot of filter area with an 18-pound pressure drop across the stone. The units each contain 20 square feet of filtration area.

Employee Plan Extended to Dow Magnesium Corp.

EXTENSION of its five-way group protection program has provided employees of two plants of Dow Magnesium Corp. with the same scale of life insurance, sickness and accident, and hospitalization and surgical benefits in force for employees of the parent concern, the Dow Chemical Co. The group plan is being underwritten by the Metropolitan Life Insurance Co. on a cooperative basis whereby the employees contribute fixed amounts and the employer bears the balance of the entire net cost.

Sealing Compounds for Plywood Aviation Fuel Tanks

THE Presstite Engineering Co., St. Louis, Mo., has announced several new types of sealing compounds, especially developed to seal plywood tanks against aviation and aromatic fuel. One type is a brush, spray or slush-type plywood fuel tank sealer which is resistant to aromatic fuels. Another is a brush-on type sealer, resistant to aromatic fuels, used for sealing flange fittings into plywood fuel tanks.

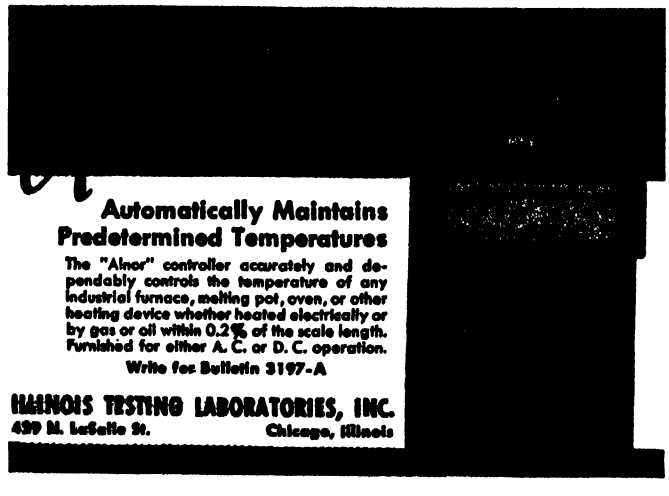
One-Coat Paint

A PAINT product that primes, seals, and finishes on any interior surface in one coat has been announced by American-Marietta Co., 43 East Ohio St., Chicago, Ill. Designated "Valdura Singlekote", it combines the hiding power and economy of water-type paints with washability, durability, and performance of oil-type coatings. It may be applied to surfaces previously coated with calcimine or casein paints, provided the old covering is bonded or tight to the wall. High hiding power permits coverage of dark surfaces with a single coat, and the product is self-leveling. It sets within 2 hours, dries within 12 hours, and provides a dead-flat finish when viewed at a 90° angle. Coverage is up to 750 square feet per gallon.



Voltage Breakdown Tester

SIMPLE means of testing voltage breakdown of materials or components is offered by the voltage breakdown tester announced by Industrial Instruments, Inc., 156 Culver Ave., Jersey City, N. J. The instrument consists essentially of a step-up transformer accurately controlled by a variac; current-limiting resistors safeguarding the equipment in the event of a dead short; a relay indicating by means of a panel light when there is a breakdown; a meter providing direct-reading voltages; and the rectifier and filter circuit providing the high-voltage direct current.

Flameproof Lighting Fixture

A FLAMEPROOF fluorescent lighting fixture of molded asbestos has been approved by the Underwriters' Laboratories. This substitute for steel lighting fixtures, the Asbestolite, is manufactured by Century Lighting, Inc., 419 West 55th St., New York, N. Y., and is designed for use in industrial war plants where complete fire resistance is required.

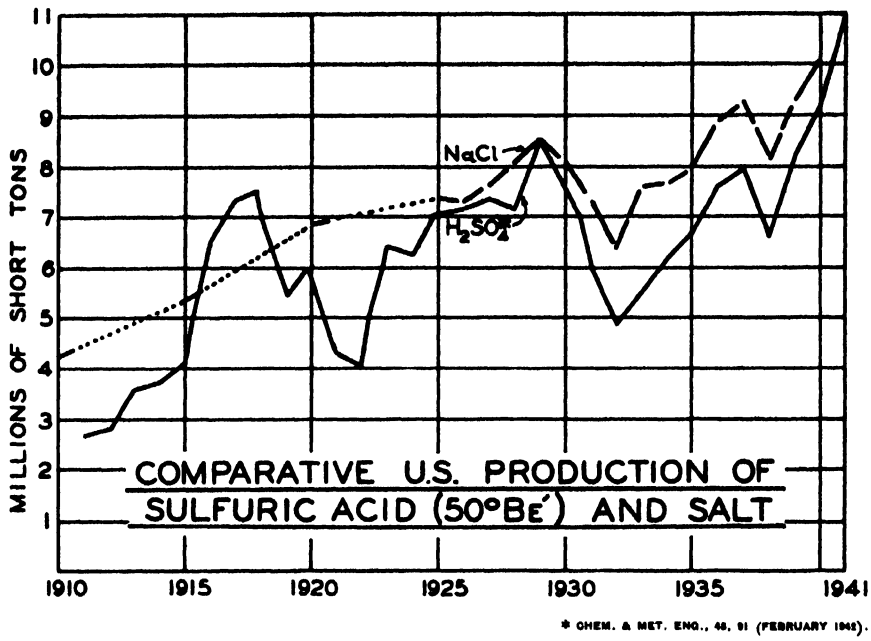
The Salt-Consuming Industries of Niagara Falls



JANET SEARLES, Electrochemicals Department, E. I. du Pont de Nemours & Co., Inc., Niagara Falls, N. Y.

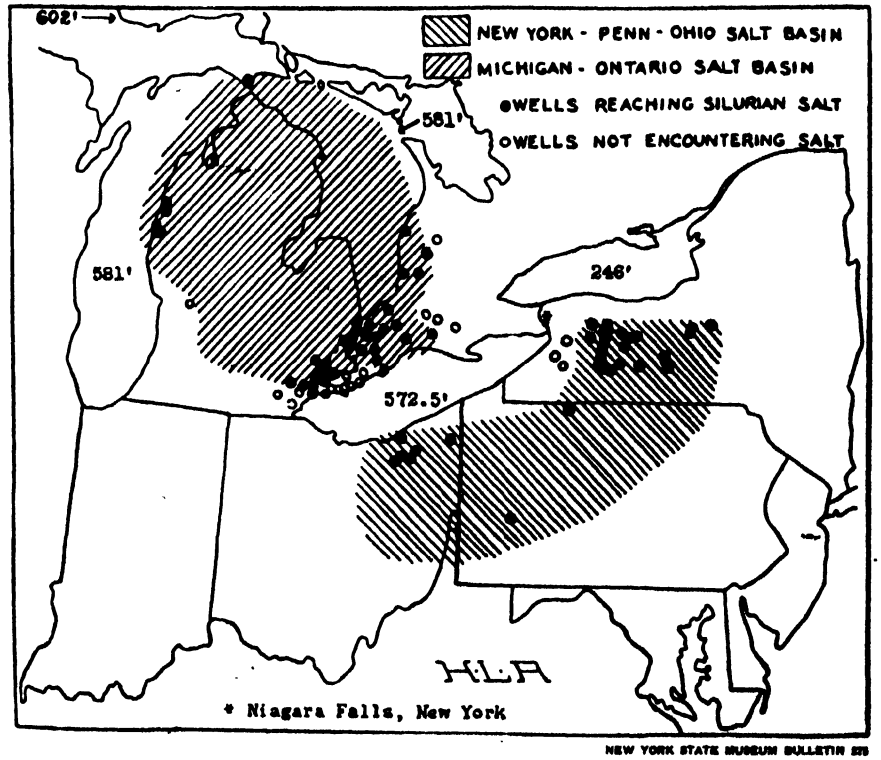
The roaring water of Niagara, hurtling down 167 feet into the gorge below, symbolizes the power behind a great chemical industry.

To those who know Niagara Falls only as a scenic wonder frequented by tourists from near and far, it must be something of a shock to learn that 400,000 tons of common salt, roughly 4 per cent of the total U. S. production, are consumed each year by six of the 30 industrial plants at Niagara Falls. Although the birth of Niagara's salt-consuming industries took place a little less than 50 years ago, the story of their development can match in color and character the endless tales of that old frontier.

Almost simultaneously with the evolution of Niagara Falls from a small grist mill center to the world's greatest source of power and light, American industrialists were successfully developing equipment for the commercial electrolysis of salt and its solutions. Two companies appear to have been "firsts" in this work; both were attracted to Niagara Falls by the promising power situation, the proximity to vast salt fields, and the favorable location with respect to potential consumers. The Roessler & Hasslacher Chemical Co., Perth Amboy, N. J., manufacturers of metal cyanides, ceramic colors, and similar chemicals, had found a satisfactory method for combining metallic sodium with potassium ferrocyanide to form a low-cost sodium potassium cyanide of high cyanogen content. At first the required sodium was imported from England, but as the demand from the mining industries rose it became evident that a domestic supply was imperative. In 1895, therefore, three partners—the English Castner Co., the German Deutsche Gold and Silber Scheideanstalt, and the Roessler & Hasslacher Chemical Co.—formed the Niagara Electro Chemical Co. at Niagara Falls for the production of sodium from fused caustic by the Castner process. Meanwhile engineers of the Mathieson Alkali Works

* CHEM. & MET. ENG., 48, 91 (FEBRUARY 1941).

The term "heavy chemical" invariably calls to mind sulfuric acid, yet this graph illustrates the fact that salt deserves equal consideration as "king" of the chemical industry.

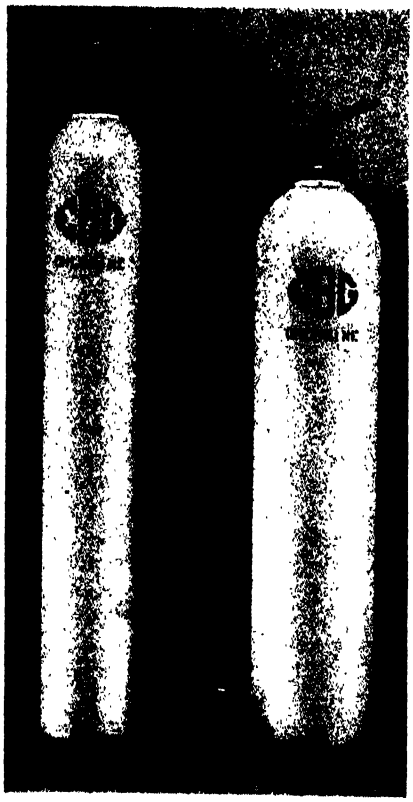


were developing the Castner rocking mercury cathode cell for electrolysis of brine in Saltville, Va. While the feasibility of this method for producing caustic soda and chlorine was satisfactorily proved, it was also demonstrated that a source of cheap power would be necessary. Mathieson, therefore, decided to build a new plant for the process at Niagara Falls. In 1896 it formed the Castner Electrolytic Alkali Co., which was operated as a subsidiary until merged with the parent company in 1917. It was in this plant that, late in 1896, Mathieson began the first U. S. production of bleaching powder.

The following year a new industry came to Niagara Falls when the Oldbury Electrochemical Co. began the manufacture of chlorates, including those of sodium and potassium, and potassium perchlorate by the electrolysis of salt solutions.

The year 1901 witnessed the founding of another company for the electrolytic manufacture of alkali and chlorine, the Roberts Chemical Co., which used the Roberts vertical diaphragm cell. The next year this firm distinguished itself by becoming the first United States manufacturer of hydrochloric acid ex the hydrogen and chlorine produced in caustic-chlorine cells (*10*).

It was about this time that Townsend and Sperry were developing the famed Townsend vertical diaphragm cell in their Brooklyn laboratories. Elon Huntington Hooker, founder and president of the Hooker Electrochemical Co., followed this work with interest. When the experimental studies had been successfully completed, ground was broken at Niagara Falls for the original Hooker plant. Eight months later, on January 9, 1906, operations were started in the plant, then known as the Development and Funding Co.



The first decade of the 20th century was an important one to the American alkali-chlorine industry, for it was in 1906 that E. D. Kingsley and his associates succeeded in liquefying the first small cylinder (1 pound) of liquid chlorine ever produced in this country. A year later the Electro Bleaching Gas Co. was formed to exploit this achievement, and in 1909 its operations were started in Niagara Falls, adjacent to the plant of the Roberts Chemical Co., which furnished the chlorine for liquefaction. Soon afterward the Roberts Chemical Co. was sold to the Niagara Alkali Co. Subsequently, the Roberts cells were replaced by Billiter horizontal diaphragm cells and later by circular diaphragm cells for more efficient operation. The first in this country to produce flake caustic soda, Niagara Alkali also was first in the production of caustic potash and carbonate of potash. Electro Bleaching Gas also flourished in the company of its neighbor and introduced chlorine into many new fields, such as textile, pulp and paper, and shellac bleaching; in 1913, it demonstrated the effectiveness of water sterilization with chlorine at Niagara Falls.

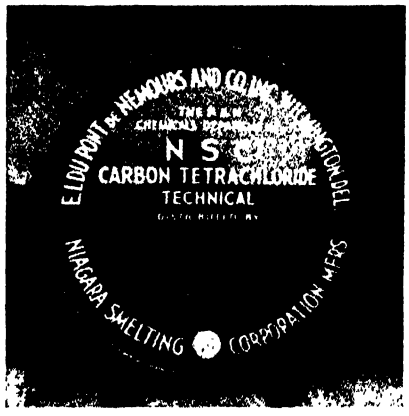
In 1917 Niagara Alkali was acquired by Electro Bleaching Gas and the two companies grew side by side until July 1, 1941, when they united under the name of Niagara Alkali Co.



The change wrought in the Nation's chemical markets by the first World War brought still another electrolytic alkali in-

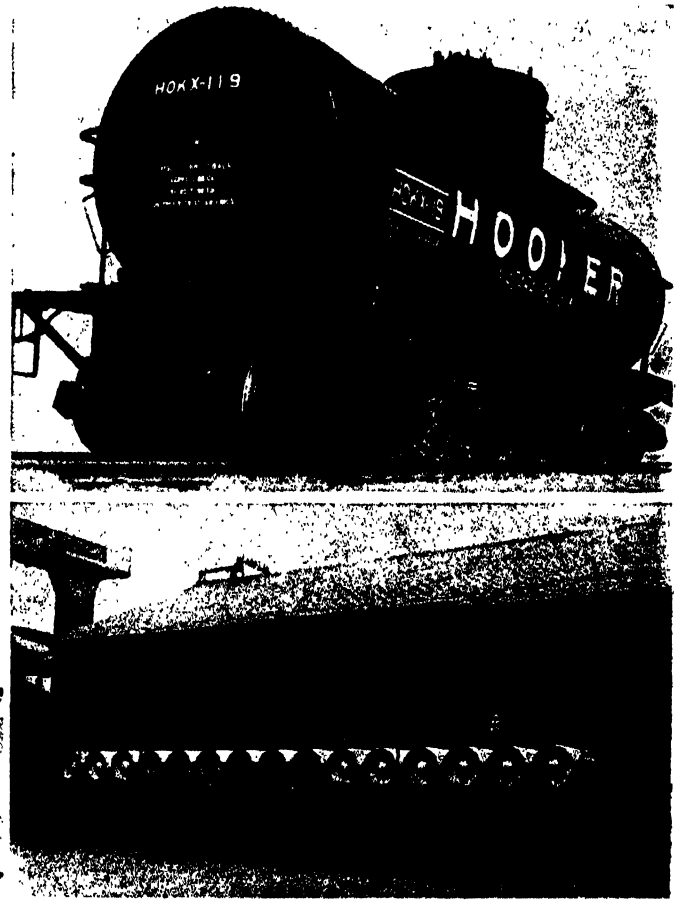
dustry to Niagara Falls, the Niagara Smelting Corp. Originally organized for the manufacture of aluminum, Niagara Smelting never produced this metal, but has been conducting successful caustic-chlorine operations in Wheeler type vertical diaphragm cells since its founding in 1916. The company consumes a large portion of the chlorine produced for the manufacture of chlorides, most important of which is carbon tetrachloride made from carbon disulfide (*5*).



As a matter of fact, the chlorine evolving from the anodes of the thousands of cells in these six factories at Niagara Falls has found its way into other industries by many and devious paths. In addition to the vast quantities consumed in the manufacture of chlorine derivatives, 300 tons of liquefied chlorine, or about 15 per cent of the total U. S. production for 1941, is shipped out daily in cylinders, ton tanks, and tank cars. All the producers at Niagara Falls have played their important part in perfecting the design of chlorine containers; to Mathieson, however, goes the distinction of developing the famed ton container and its carrier, the multi-unit

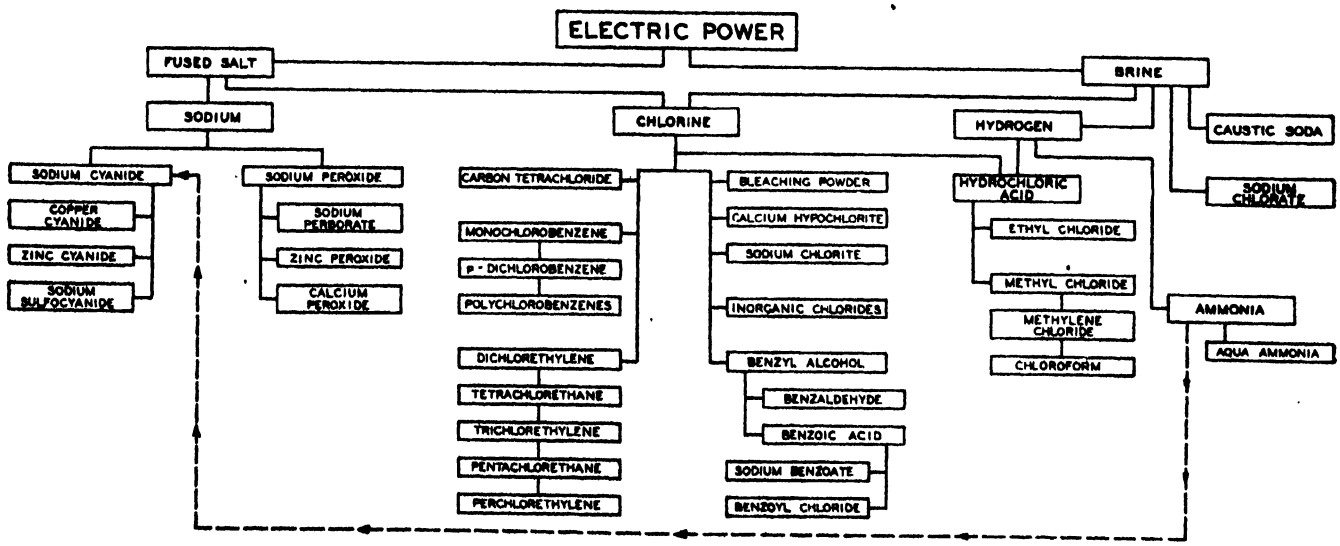
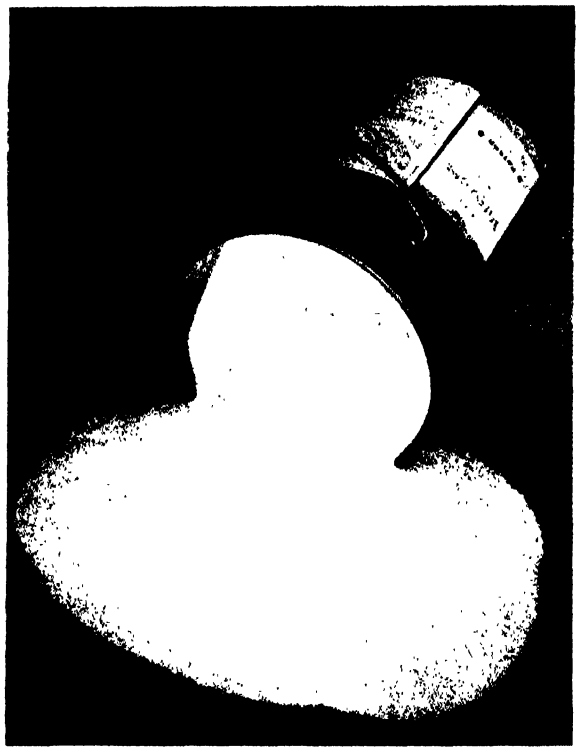
tank car. History relates that the first single-unit chlorine tank car was shipped from Wyandotte, Mich., to Chrome, N. J., in 1909 (*11*). Thirteen years later Mathieson put the first multi-unit tank car into service, but another three years were required to win full tank-car rating for the new carrier by the Interstate Commerce Commission. Meanwhile, equally important strides were being made by the chlorine producers in the development of new and valuable derivatives of chlorine. Today more than 30 chlorine products form the list of vital industrial chemicals manufactured by these six companies. Included are such a variety of compounds as disinfectants, medicaments, bleaching agents, solvents, mordants, dyestuff intermediates, dielectrics, etc., to which have been added countless specialty products with manifold applications.

In 1923 Mathieson established another "first". By combining the hydrogen evolved in its caustic-chlorine cells with nitrogen from the air, the manufacture of synthetic ammonia was initiated in the United States (*4*).

MATHIESON ALKALI WORKS (INC.)

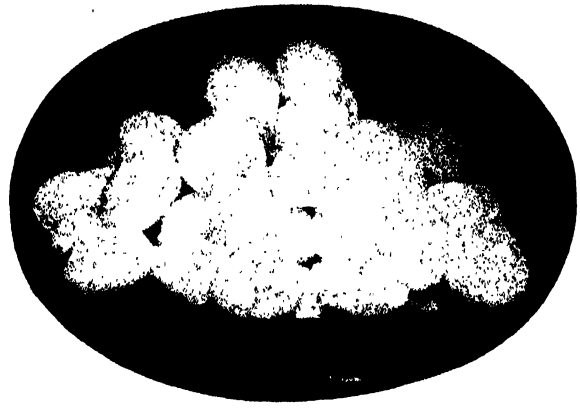


Loading a multi-unit tank car



During this period of development, extensive work was being carried out on electrolytic cells for sodium manufacture. R. J. McNitt had converted the Castner fused caustic cell to a fused salt electrolyzer, but many technical problems impeded production. Finally in 1924 James C. Downs succeeded in perfecting a highly efficient sodium cell. The following year the partnership controlling the Niagara Electro Chemical Co. was dissolved and all interests were taken over by the Roessler & Hasslacher Chemical Co. In 1930 this firm was acquired by E. I. du Pont de Nemours & Co., Inc., and operated as a subsidiary until January 1, 1933, when it became The R. & H. Chemicals Department of du Pont. Recently, June 1, 1942, the name was changed to Electrochemicals Department, the better to typify its various products. Much of the sodium produced in the Downs cells was, and is, consumed at the plant itself in the manufacture of sodium peroxide, sodium perborate, and other peroxygen products, sodium cyanide and related metal cyanides, and a variety of specialty products.

As R. & H. was working on the sodium cell, Hooker was seeking to perfect its caustic cell. It was in 1925 that K. E. Stewart of the latter company began his work on an improved asbestos diaphragm, intended originally for use in the Hooker Type E or Marsh cells. This and other refinements led to the development of the present Hooker Type S cell, compact in design and offering less radiating surface than the earlier types (*9*).



The salt-consuming industries on the Niagara Frontier have devoted their efforts to the improvement of basic processes and the development of new specialties and derivatives. The efficiency attained by these six old friends has been greatly promoted by the aggressive, independent research which has made of each a leader in its field, and by a spirit of mutual cooperation which derives from the similarity of economic problems encountered. Rarely does the tourist entering Niagara Falls detect the low red buildings

PRINCIPAL PRODUCTS MANUFACTURED BY THE SALT-CONSUMING INDUSTRIES OF NIAGARA FALLS, NEW YORK

Du Pont's sodium peroxide, known by the trade name "Solozone" DFF

One-ounce egg-shaped castings of du Pont's sodium cyanide, known by the trade name "Cyanegg"

of Oldbury behind its old-world brick walls. Nor does he usually find time to admire the growth of near-by Niagara Alkali and Hooker, apparent though this is from the structure and different hues of their many buildings. Further down the Niagara River, the equally numerous buildings of Mathieson and du Pont's Electrochemicals Department appear to be scrambled behind a maze of fences. Off by itself, beyond the city limits, Niagara Smelting stands as a sentinel above the deep chasm formed by the water from the Falls.

Behind each new discovery and development of the 50 or more chemicals derived from salt at Niagara Falls lies a tale of energy and perseverance. It is impossible even to skim the surface in an article of this sort, for to recount these stories would fill a good-sized book. However, for the benefit of those who might like to delve further into such fascinating history, a few of the many available references are appended.

IMPORTANT NOTICE

Convention Attendance

IN THE preliminary program of the Buffalo meeting, it was announced that divisional meetings would start on Tuesday morning. Those who have made hotel reservations undoubtedly have done so on the basis of this information. Since then, plans have been changed so that divisional meetings will start Monday at 2:00 P. M. in order that an extremely important general meeting may be scheduled for Wednesday afternoon.

Because of this departure from customary practice, many individuals may wish to change their time of arrival. Owing to the critical hotel situation expected in Buffalo over Labor Day week end, the Hotels and Housing Committee urge that anyone planning to arrive earlier than the date indicated on his reservation notify the committee *at once*. The alteration can be made at this time—later it may not be possible.

Send your communication to Edward F. Wesp, Chairman, Hotels and Housing Committee, Buffalo Meeting of the AMERICAN CHEMICAL SOCIETY, Buffalo Convention and Tourists Bureau, Genesee Building, Buffalo, N. Y.

A. C. S. Golf Tournament

THE Niagara Falls Golf and Country Club, located by the Niagara Gorge and the escarpment overlooking Lewiston, N. Y., has been chosen for the regular A. C. S. Golf Tournament. The course is probably one of the most interesting in Western New York. Its sand traps are a challenge to any golfer, whether he shoots 80 or 120. Everyone entering the tournament will not only enjoy a good golf game but also a pleasant 19th hole.

Physical and Inorganic Chemists Cancel Symposium

THE annual symposium of the Division of Physical and Inorganic Chemistry, AMERICAN CHEMICAL SOCIETY, usually held at Christmastime, will be omitted in 1942 because of world conditions.

Chicago Section Moves

THE Chicago Section of the A. C. S. moved its headquarters to the Medinah Club, 505 North Michigan Ave., Chicago, Ill., as of August 1. The move was made necessary by the fact that the United States Army has requisitioned the Stevens Hotel, headquarters of the section for many years, for the lodging and training of Army and Air Force technicians.

The Chicago Chemists' Club, which shared the quarters of the Chicago Section in the Stevens Hotel, has made a similar arrangement with the section for the use of quarters at the new address.

Synthetic Resin Replaces Industrial Rubber

Applications of Resistoflex, a "Substitute" for Rubber, Pictured on Pages 1040 and 1041

INDUSTRY, busy supplying the diverse munitions of war, requires rubber for countless important parts of the machines used to fabricate the Army's weapons of destruction. War workers commutation may become slower and consume more time as the trend to transportation pools and walking becomes more pronounced, cars may be put up for the duration, rubber's use in myriad things may be completely prohibited—and production of fighting tools would be slowed hardly enough to show on War Production Board Nelson's charts. But a lack of rubber for the intricate machine tools and fabricating units of industry would wreak havoc with mounting trends. Stopping of any of these machines means fewer weapons for the United Nations. This must not happen. The answer is not only in the conservation of the Nation's 700,000-ton backlog of crude rubber and in collection of vast quantities of scrap. All these supplies are needed for Army truck tires, for Navy life rafts, and for Marine assault boats. Industry has had to find substitutes, and one company, the RCA Manufacturing Co. at Camden, N. J., manufacturer of things diverse as phonographs and electron microscopes, has succeeded in replacing many of its rubber objects with a substitute—a substitute which in almost every instance has out-performed the natural material. This replacement is compounded from polyvinyl alcohol, which exists only in a blissful polymerized union for, being the enol form of acetaldehyde, it cannot exist as a monomer. This material is marketed by the Resistoflex Corp. of Belleville, N. J., in compounded, extruded, and fabricated shapes under the trade mark, Resistoflex PVA. Add to the anomalies of Resistoflex, it easily resists oil, organic solvents, gasoline, is impermeable to oxygen, nitrogen, and hydrogen, but in the presence of water, like a small boy in vacation time, it is completely undone. The complex molecule is soluble in water and for all applications must be engineered to the task to which it is put. Recognition of a limitation serves to make exploration of permissible applications more thorough; and with notable success this was done by RCA and Resistoflex, for minor concentrations of water, such as in gasoline and foods, have no effect on the compounded material.

Typical examples are the flexible gas and air lines on the automatic machines for forming radio tubes. Custom had made rubber tubing standard for these installations because of its ready availability, relatively low cost, and ease of installation. Similarly the many connections between valves, traps, pumps, and gages for evacuating and sealing operations were all made from pure gum rubber. Today these are made from Resistoflex, but not before both managements had subjected the new material to every torture test their dubious engineers could devise. Machines shook, pounded, twisted, pulled, and flexed samples of Resistoflex hose carrying hot oil, gases under pressure, organic solvents for metal cleaning, illuminating gas, and as little air as an efficiently modern, high-vacuum pump could leave. Then came plant trials, side by side with standard rubber materials, and in every use sanctioned by design engineers, polyvinyl, like Pollyanna, came cheerfully through.

Installations of the new hose are made with little or no change in machine design. In several cases it has eliminated the need for an extension of metal pipes—another proposed rubber conservation step; such extensions would shorten the lengths of rubber connecting tubes. Only a few sizes of hose are now stocked to match the standard pipe nipples used, making these polyvinyl compounds as adaptable as the original material; for in addition to replacing rubber with Resistoflex, RCA is also to a large extent using tubing of this type to displace flexible metal hose, generally made of brass, copper, or stainless steel.

Another advantage offered by Resistoflex tubing is the fact that the compound from which it is extruded can be varied to meet the particular requirements of specific applications. Thus, when RCA first started experimenting with the material, engineers of the Resistoflex Corp. formulated a special compound to meet its needs. From this was fabricated a cotton-covered hose especially adapted to required processes. This hose has been standardized for many uses where a quantity of high-grade gum rubber was formerly employed. Already the life of this new tubing has proved to be far in excess of that normally experienced.

Rubber Machine Parts

While the replacement of rubber tubing was a major objective, the RCA conservation campaign did not stop there. The company was also using rubber for many machine parts of a highly mechanical nature. Experiments with Resistoflex PVA in the tubing field had revealed that, in addition to having high solvent resistance and exceptionally low permeability, it was extremely tough and stood up under both flexing and abrasion. The Resistoflex engineers were asked to revamp samples of their sheet stock until a compound was formulated which conformed to the rubber durometer index and texture. Testing of the alternate material was simplified by the ease with which blocks could be fabricated. Pieces were cut or punched from $^1/_{16}$- or $^1/_8$-inch sheet. These were then laminated into washers, spacers, and rollers, without the need for any special presses or molding machinery. Rough shapes so formed were machined to required dimensions on standard shop equipment. Some such sections were frozen solid in liquid air or mounted on wooden blocks to facilitate machining.

In these mechanical applications involving abrasive action and torsional strains, Resistoflex has consistently outlasted rubber. A typical instance involves a power transmission device wherein a revolving turret carries a series of heads, which in turn are revolved in a sequence of indexed positions. The heads are caused to rotate when their shallow-toothed, metal-drive gears are brought into mesh with rings clamped to driven shafts below the turret. Resistoflex easily replaced rubber for these power transmission rings.

In another application a two-ply tube was formed by rolling $^1/_{16}$-inch sheet about a $^1/_8$-inch diameter mandrel. This tube was installed in a sandblast suction line where rubber tube had lasted only a few days. The replacement tubing has already been running for several months. In the same machine sandblast shields made of PVA sheet have likewise proved their worth, not only in wear but because it has been possible to fabricate the compound to combine maximum protection with flexibility needed for easy operation.

The list where the "substitute" material is becoming standard is growing daily. Among mechanical parts being fabricated from the synthetic resin are forming rollers, forming-press jaw linings, aligning devices, vibration dampers, shock absorbers, power transmission rings, foot pedal coverings, metal belt pulley facings, and in ball mill cover gaskets where it stands up under solvents which destroyed previous gaskets made from natural or synthetic rubber. Sections of sheet material have been cemented together to make a small-parts conveyor belt, superior even to a belt of woven wire.

RCA's campaign has resulted not only in releasing quantities of rubber, but also in technological advances through the necessity of testing a material which normally might not have been considered.

Florence B. Seibert to Receive Garvan Medal

Florence B. Seibert

THE Garvan Medal honoring women in chemistry will be awarded to Florence B. Seibert, associate professor of biochemistry, Henry Phipps Institute of the University of Pennsylvania, at the 104th meeting of the AMERICAN CHEMICAL SOCIETY to be held in Buffalo, N. Y., September 7 to 11

Dr. Seibert has been named to receive the award because of "distinguished work on the chemistry of tuberculosis". She isolated the active substance in tuberculin, widely used in the detection of tuberculous infection in man and animals, prepared the International Standard tuberculin, and is the recognized expert in her field. The purified tuberculin protein that she has prepared is said to have vastly improved the methods of diagnosis. Her latest work has consisted of the production of a large quantity of the purified tuberculin for deposit as an official standard tuberculin.

Dr. Seibert also discovered the frequent presence of fever-producing bacteria in distilled water, a finding called of great importance in surgery and in all fields involving intravenous injection. Her research led to a refinement in methods of producing distilled water for injection so that now fever should not result from such injections.

Dr. Seibert is thoroughly modern in her approach to chemical problems and, as a result of a year's work with Professors The Svedberg and Arne Tiselius in Upsala, Sweden, is an expert in the rapidly developing techniques of high-speed centrifugation for the determination of molecular weights and electrophoresis.

From the start her work has been marked by remarkable accuracy in delicate manipulations. Her skill in chemical procedure is shown by the fact that she was able to recrystallize the tuberculin protein no less than 14 times, a remarkable feat in view of the known difficulty in crystallizing proteins. Her work has been of both theoretical and practical importance.

Dr. Seibert was born in Easton, Penna., on October 6, 1897, and was graduated from Goucher College in 1918. She received the Ph.D. degree in 1923 from Yale University, where she was Van Meter Fellow and Porter Fellow. Under Lafayette B. Mendel at Yale she showed that the production of fever by distilled water depended on the bacterial contamination of supposedly pure water.

Awarded the Porter Fellowship at the University of Chicago in 1923-24, she continued her research under H. Gideon Wells and Esmond R. Long, and proved that minute amounts of nitrogenous material in contaminated distilled water were quite adequate to account for the fevers produced. Dr. Seibert began her work on tuberculin using a synthetic protein-free culture medium devised by Dr. Long, and established definitely the protein nature of tuberculin. Isolating the protein concerned in highly purified form, she studied its chemical and biological properties. Her product was recognized as the standard for potency of tuberculin by the Division of Biologics Control of the National Institute of Health of the U. S. Public Health Service.

Dr. Seibert was on the staff of the Sprague Memorial Institute, Chicago, from 1924 to 1932. In the latter year she joined the faculty of the Henry Phipps Institute which is devoted to the study, treatment, and prevention of tuberculosis. She received the Ricketts Prize of the University of Chicago in 1924, and the Trudeau Metal of the National Tuberculosis Association in 1938. Goucher College honored her with the LL.D. degree in 1937 and the University of Chicago with the Sc.D. degree in 1941, when she spoke at the university's semicentennial celebration.

She is a member of the AMERICAN CHEMICAL SOCIETY, the American Society of Biological Chemists, American Association for the Advancement of Science, Chicago Institute of Medicine, Society of Experimental Biology and Medicine, Physiological Society of America, the National Tuberculosis Association, Phi Beta Kappa, and Sigma Psi.

She has published many papers in the fields of cellulose, bacterial and protein fevers, the chemistry of proteins and tuberculin, immunology, and tuberculosis.

The Women's Award Committee, which chose Miss Seibert to receive the medal, is composed of Mary L. Sherrill, Chairman, William Lloyd Evans, Louise Kelley, M. L. Crossley, Cornelia T. Snell, and Hiram S. Lukens.

The Garvan Medal was founded by the late Francis P. Garvan of New York, president of the Chemical Foundation, Inc. The first award, in 1938, went to Emma Perry Carr, head of the chemistry department of Mount Holyoke College, for her researches in physical chemistry, especially on the structure of organic molecules by means of absorption studies in the far ultraviolet, and the second in 1940 to Mary E. Pennington of New York, authority on the refrigeration of perishable foods, as being an outstanding woman chemist, whose unique career has been that of a teacher, director of research, and consultant.

Oncley Receives A. C. S. Award

BACHRACH

John Lawrence Oncley

THE AMERICAN CHEMICAL SOCIETY Award in Pure Chemistry for 1942, initiated by the late A. C. Langmuir and now provided through the generosity of Alpha Chi Sigma, has been awarded to John Lawrence Oncley, in charge of the Ultracentrifuge Laboratory at the Harvard Medical School. The $1,000 prize will be presented at the AMERICAN CHEMICAL SOCIETY meeting in Buffalo, September 7 to 11.

Born in Illinois, Dr. Oncley was educated at Southwestern College, Winfield, Kans., and at the University of Wisconsin. At the age of 32 he is already outstanding in original accomplishment. His career in chemical research has included duties as fellow of the National Research Council at Massachusetts Institute of Technology, instructor in chemistry at the University of Wisconsin, research chemist at the General Electric research laboratory, instructor in chemistry at M. I. T., and research associate at the Harvard Medical School.

His investigations in the dielectric properties of gases, insulating oils, resins, rubbers, and proteins have proved of fundamental importance and have brought him wide acclaim. Dr. Oncley has developed radio-frequency bridge methods suitable for precise dielectric constant determinations with proteins and with their aid has completed what may be termed the first completely satisfactory study of the dielectric dispersion behavior of water-soluble proteins. These studies in turn have led to an interest in the molecular size and shape of protein molecules, which is being broadened by new experience in charge of Harvard's Ultracentrifuge Laboratory.

Previous Recipients of A. C. S. Award

Recipient	Meeting	Year	In Recognition of
Linus Pauling	Buffalo	1931	Work on the structure of crystals and nature of the chemical bond
Oscar Knefler Rice	Denver	1932	Studies of the mechanism of chemical reactions
F. H. Spedding	Chicago	1933	Application of spectroscopy to the study of atomic and molecular structure
C. Frederick Koelsch	Cleveland	1934	Researches on the chemistry of condensed ring systems
Raymond M. Fuoss	San Francisco	1935	Authorship of the first comprehensive theory of electrolytic solutions which, at lower concentration, applies to all solvent media and to all electrolytes
John Gamble Kirkwood	Pittsburgh	1936	Work with the dielectric properties of matter under high pressures
E. Bright Wilson, Jr.	Rochester	1937	Work in physical chemistry
Paul Doughty Bartlett	Milwaukee	1938	Progress in the important borderline field between organic and physical chemistry and in particular his research in stereochemistry and mechanisations of organic reactions
Lawrence Olin Brockway	Detroit	1940	Contributions in the determination of molecular structure by electron diffraction methods
Karl A. Folkers	Atlantic City	1941	Contributions in the field of organic chemistry, including Erythrina alkaloids, vitamin B_6, catalytic hydrogenations, and pyrimidines

Data Published on Selective Service

Because of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training, and the need for technically trained persons. Future developments will be brought to the attention of our readers.

BUFFALO ★

Sets of Abstracts

Sets of abstracts of the Buffalo meeting papers in planographed book form will be supplied by the A. C. S. News Service, 1155 16th St., N. W., Washington, D. C. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors. The abstracts will be mailed as soon as possible after receipt of order, beginning about September 2, and will also be on sale at the Buffalo meeting of the American Chemical Society, September 7 to 11, 1942.

This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.

To those without receipt for divisional dues, who remit with order, $1.00.

To those who fail to enclose remittance with order, necessitating correspondence, $1.25.

To those who require bills to be rendered, $1.50.

Alpha Chi Sigma Chapter Sets Up New Award

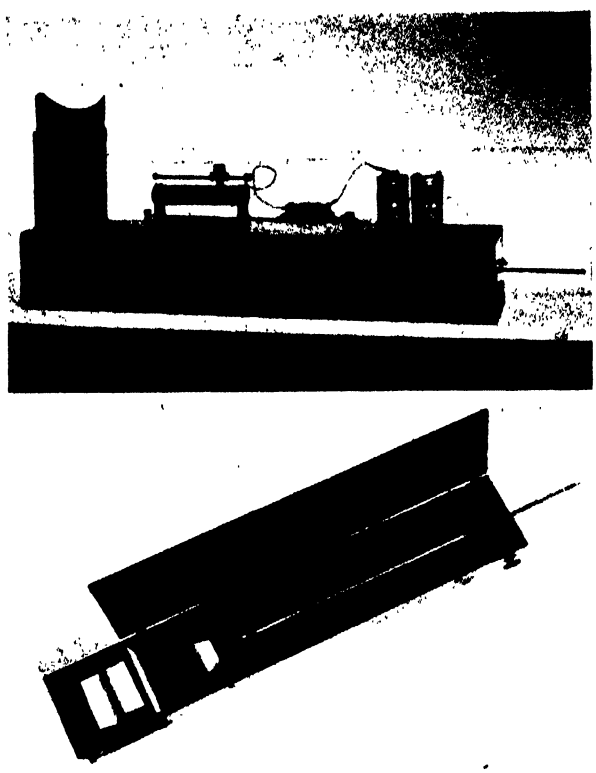
In commemoration of Charles E. Munroe, the George Washington Chapter of Alpha Chi Sigma has established an annual award of prizes for the best essays submitted by freshmen and sophomore students of chemistry at certain colleges in the District of Columbia. The topic of the essay this year was "New Developments in Chemistry and Their Relation to the World Crisis". First prize was awarded to Raymond P. Wheeler of Catholic University. David J. Barsa and Louise C. Powell, both of George Washington University, won the second and third prizes, respectively.

Motion Pictures Issued on Heat and Home Insulation

"Heat and Its Control" and "The Story of Rock Wool Home Insulation", new educational motion picture films in sound, produced under the direction of the U. S. Bureau of Mines, 4800 Forbes St., Pittsburgh, Penna., are ready for distribution. Copies in 16-mm. sound are available free of charge, except that the borrower is expected to pay transportation charges and for loss or damage other than normal wear.

Du Pont Branch Managers of Electrochemicals Department Meet

An average of over 31 years each of service with E. I. du Pont de Nemours & Co., Inc., is the record of these 11 men photographed at the recent branch office managers' meeting of the Electrochemicals Department in Wilmington, Del. *Back row, left to right:* A. C. Stepan, C. Dittmer, R. H. Dufault, L. R. Kennette, A. R. Tucker, and W. P. Stoll. *Front row, left to right:* H. A. Schumacher, E. C. Schwarzenbek, G. W. Goerner, C. Seiler, and G. A. Bode. Mr. Schumacher is the manager of the West Coast plant; Mr. Bode, manager of Miscellaneous Sales; the others, branch office managers.



Properties of Luminescent Materials[1]

C. E. BARNETT, Research Division, The New Jersey Zinc Co. (of Pa.), Palmerton, Pa.

With wartime conditions many military and some civilian operations must be performed under materially reduced levels of illumination. The press has contained many references to loss of life and traffic snarls resulting from trial and real blackouts which, in turn, have created a widespread interest in the possibilities of luminescent materials. There are quite general misconceptions regarding the properties of fluorescent and phosphorescent substances which can lead to disappointments in their use. Many of the phosphors are advertised as continuing to emit light for 48 hours or more after excitation. Although this is true, the light emitted is quite low and, while it may seem ample in complete darkness, it must be remembered that visibility depends on the contrast with light from the environment.

Brightness and Decay of Phosphors

From a few minutes after extinguishing the exciting radiation up to two hours in darkness, the brightness of most phosphorescent materials will range between 10 and 0.1 microlamberts. Brightness measurements in this region, if color differences are involved, present a considerable problem. The luminosity curve of the eye does not remain constant when the brightness of a surface is less than a foot lambert, but becomes progressively more blue-sensitive and less red-sensitive as the brightness is reduced to 0.5 microlambert. This shift of the luminosity curve toward shorter wave lengths at low brightness, known as Purkinje's phenomenon is most pronounced between 200 and 1 microlambert. At brightnesses below 0.5 microlambert, the eye again has a constant luminosity curve corresponding to the dark-adapted or scotopic eye. As a practical example of this effect, Goulden (*5*) reports that, if a red of 670 millimicrons is viewed under conditions of light adaptation and moderate intensity of illumination and found 10 times as bright as a blue of 480 millimicrons, and then the light is decreased and the eye dark-adapted, there will be a reversal of the relative brightness and the blue will appear 16 times as bright as the red. The luminosity curves for photopic (light-adapted) and scotopic vision have been published by Taylor (*10*) among others. Common practice of showing these curves with peaks adjusted to equal luminosity is misleading since the response of the scotopic eye at maximum sensitivity is from 50,000 to 150,000 times that of the photopic eye (*7*). The British Standard Specification BS/ARP 18 (*2*) points out that, because of the existence of the Purkinje phenomenon, the relative values of the brightness of differently colored surfaces of low brightness expressed in foot lamberts have little bearing on their relative effective brightness as directly judged by the eye.

Above, Figure 1. Wide angle photometer. *Below*, Figure 2. Photometer with cover removed

Visual meters for the measurement of low brightnesses have been described by Taylor (*10*) and in British Standard Specifications (*2*). Both of these and the one about to be described depend on the simplification of the optical system to avoid loss of light and on a large field of view. For this reason the instrument described below and illustrated in Figures 1 and 2 has been called a wide angle photometer. Its design was suggested by A. H. Pfund. The light from the surface of the sample is matched in brightness with that from the photometer lamp as reflected from the front surface mirror. The lamp may be moved from 2.5 to 25 inches from the glass diffusing screen by the photometer bar which is marked off according to the inverse square law with a reading of 100 when the lamp is 2.5 inches from the screen. Holders are provided in front of the lamp for color filters to facilitate matching the light from the sample and for neutral tint filters to extend the range of the instrument. The use of filters matching the color of sample and lamp avoids some of the trouble due to the shift in the luminosity curve of the eye. The photometer lamp is a 32-candlepower automobile headlight lamp operated from a 6-volt storage battery with a current of 2.2 amperes. The arrangement of these parts is obvious from an inspection of Figure 2 which shows the instrument with the cover removed. Scale divisions on the photometer bar are converted to absolute units by calibration of the instrument against a standard lamp. The photometer calibration is made over a brightness range from approximately 100 to 5,000 microlamberts and extended into the low brightness region by extrapolation. However, the measurements with the photometer are made with the eye varying from light adaptation to complete dark adaptation according to the brightness of the phosphor. Thus the reported brightness values are the effective brightnesses as seen by the eye, and these are expressed in terms of a light-adapted eye. This instrument has since been checked against a lamp calibrated by the National Bureau of Standards for the brightness range between 4 and 0.5 microlamberts. The results of the two methods of calibration agreed within 5 per cent.

Figure 3 shows decay curves as determined with the wide angle photometer for zinc sulfide, zinc–cadmium sulfide, calcium sulfide, and strontium sulfide phosphors. In the zinc sulfide and zinc–cadmium sulfide phosphors copper was used

[1] Presented before the Paint, Varnish, and Plastics Division at the 103rd meeting of the American Chemical Society in Memphis, Tenn., April 20 to 23, 1942.

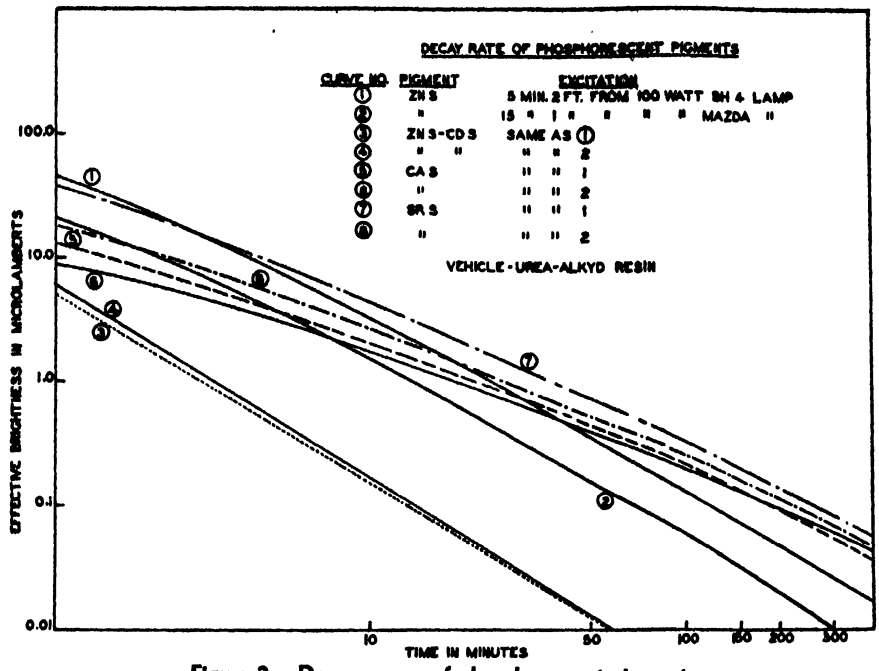


Figure 3. Decay curves of phosphorescent pigments

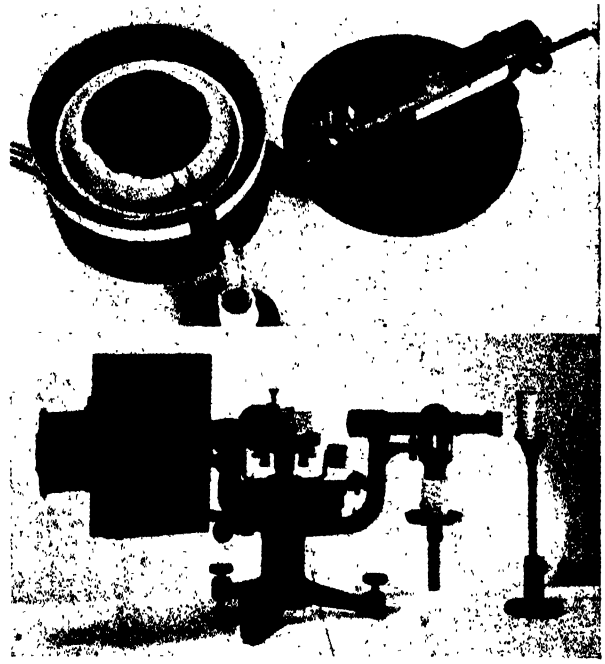
as the activating metal. The latter phosphor contained approximately 80 per cent zinc sulfide and 20 per cent cadmium sulfide. Bismuth was used as the activating metal in both of the alkaline earth sulfide phosphors. The calcium sulfide phosphor was a mixture of calcium and strontium sulfides in an approximate ratio of 80 parts calcium sulfide to 20 parts strontium sulfide, while the proportions of the two sulfides were approximately reversed in the strontium sulfide phosphor. The curves show the general order of the differences to be expected between these different types of phosphorescent pigments, but no claim is made that they exactly represent the respective classes. For these tests the pigment was stirred into a vehicle composed of 50 per cent American Cyanamid Co.'s Beetle resin solution No. 592, 25 per cent butanol, and 25 per cent xylene. The paint was applied to the panel and baked for 30 minutes at 225° F., then a clear coat of the vehicle was applied over the pigmented coat and the baking repeated. The decay curves have been determined for each pigment after excitation by a 100-watt Mazda filament lamp and a 100-watt B. H. 4 high-pressure mercury vapor lamp. These two lamps represent extreme differences in distribution of the exciting light since the filament lamp provides only 0.07 per cent of its energy at wave lengths less than 3,800 Å. while the mercury vapor lamp has 2.4 per cent of its total energy in this region (*1*). This difference in excitation makes little difference in the long-period decay curves with the exception of that for the zinc and strontium sulfides. It would, however, make a great difference in the fluorescence and initial short-period phosphorescence. The measurements were continued out to five hours and have been plotted on a log-log scale. Measurements with this instrument have been continued as long as 40 hours and could be carried much further but, because of the linearity of the plot, there is little point other than to show the performance of the photometer in measuring surfaces of low brightness.



Radioactive decay is a standard example of a first order reaction, yet the long-period decay in these phosphors is of the bimolecular type. Different authors have commented on this. Curie (*3*) believes that the hyperbolic form may mean nothing more than an approximation to the development of a sum of exponential functions satisfying certain conditions. However, according to modern theory (*9*), when a quantum of light is absorbed by an atom or ion of a crystal and as a result an electron is raised into the conduction band of the solid or to an excited state, there are several possibilities:

1. It may fall directly back from the excited to the ground state with the emission of radiation and under suitable conditions the radiation will be visible. In this case, the decay after the illumination is shut off will follow the exponential law: $I = I_o e^{-\alpha t}$
2. If the electron is raised into the conduction band either directly or indirectly, it will be free to move through the crystal until trapped at one of the bound energy levels. If released from this metastable state by thermal excitation, the electron will eventually return to the ground state and under proper conditions the energy thus given up will be visible as phosphorescence. In this case the decay will follow the bimolecular law $I = I_o/(1 + \alpha t)^2$. The constant α depends on the rate of release of electrons from the metastable states and increases rapidly with temperature.

This theory satisfies the experimental data showing that the fluorescence and short-period decay vary with the kind of excitation, while the long-period phosphorescence is relatively independent of the excitation. It also accounts for the temperature sensitivity of the long-period decay. In accord with the theory the decay curve loses its bimolecular character on approaching the short decay times.

It is interesting to compare the brightness of these phosphors with the brightness of a white paint under weak illumination. In the vicinity of Palmerton on a moonless night in March with bright starlight but a slightly hazy atmosphere, the illumination from the sky was found equivalent to a brightness of 0.15 microlambert and the brightness of a white traffic paint was 0.12 microlambert. From the decay curves for Mazda (Figure 3) light excitation, the zinc–cadmium sulfide would reach the 0.12 microlambert level in 18 minutes, the zinc sulfide in 70 minutes, the calcium sulfide in 3 hours, and the strontium sulfide in 4 hours. These measurements are in good agreement with the conclusions of the British Bulletin C-17 (*6*):

With a good quality strontium or strontium–calcium sulfide the performance to be expected in practice is that a marking will be usefully visible for perhaps 4 hours after sunset on a moonless, starlight night. For several more hours, it may be discernibly brighter than a similar marking of white paint, after which the white paint

***Above*, Figure 4. Rotating type phosphoroscope. *Below*, Figure 5. Apparatus for recording fluorescent color**

is equally, if not more efficacious, depending on the relative reflection factors and on the amount of light that is being received from the night sky.

The use of an efficient phosphorescent paint will, however, ensure that the markings are visible on those few really black nights when the greatest difficulty in movement is expected.

If the illumination in the comparisons above were reduced 50 per cent by a partly cloudy sky, the phosphorescent pigments would be brighter than a white paint for 30 minutes, 2 hours, and 6 hours, corresponding respectively to the zinc–cadmium sulfide, zinc sulfide, and calcium sulfide and strontium sulfide phosphors. In comparison to the brightness of 0.12 microlambert for the white traffic paint, a value of 0.034 microlambert was obtained for a yellow traffic paint, the same value as was obtained for concrete pavement under these conditions. At the level of illumination provided by starlight the white paint was 3.5 times as bright as the yellow, while under normal illumination the brightness values relative to MgO were 80 per cent and 61 per cent for the white and yellow, respectively. This shift in relative brightness with illumination is an example of the Purkinje effect.

For many purposes the short-period phosphorescence is important and is best measured with some form of rotating phosphoroscope. A simple construction is shown in Figure 4. A phonograph motor and turntable are used as a constant-speed rotating mechanism with the drive gear of the motor changed to provide a speed which may be varied from 15 to 25 r. p. m. These are enclosed in a circular box with an adjustable opening in the side to admit the exciting light and a second opening in the movable cover. The sample is dispersed in a vehicle and brushed on the outside beveled edge of a glass pie plate which is placed, bottom side up, on the turntable. A bar photometer is mounted on the cover of the box with the photometer head sighted on the phosphor through the hole in the cover. Thus, the intensity of the luminescence can be measured while the sample is being irradiated, or by rotating the top, at any time after the excitation up to the time required for one revolution of the turntable.

Color

The color of luminescent materials is of importance in many instances and is associated with the characteristics of the eye under low illumination. From the luminosity curve for the scotopic eye it would be expected that blue-green colors would be preferable, but in many practical applications this is not the case.

The receivers of stimuli in the retina, the rods and cones, are not uniformly distributed but the latter are concentrated in the central part of the retina and are responsible for by far the most reponse to ordinary illumination. In night vision the rods located in the periphery of the retina are the most sensitive, the central region of the eye being practically "night blind". The astronomers express this paradoxically "in order to perceive a dimly lighted object, it is necessary not to look at it". Since the rods are located outside the point of most acute image formation in the retina and also since a number of rods connect with one nerve fiber, the periphery of the eye has poor perception of detail. For this reason bluish-green phosphorescent signs are difficult to read and in any case must be made with very large letters. Yellow or yellow-green luminescent letters will only obtain response from the cones in the central portion of the retina, but because of this will be in a sharp focus and often more legible even though appearing less bright. The bluish-green luminescent materials often give a feeling of discomfort akin to glare to a completely dark-adapted eye, although the brightness level may be a fraction of a microlambert. The sensation of glare with normal illumination is due to light reflected into the eye of such intensity that the pupil is contracted to such an extent that the image is thrown out of focus. Observations are made in visual glarimeters so that the light is received on the periphery of the retina by the same receivers which are responsible for vision with weak illumination. Years ago, F. Gotch (*4*) made some interesting observations on picking up lights at sea at night that bear on this:

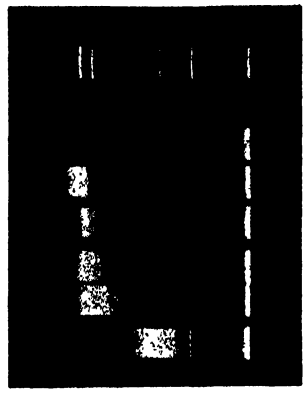


Figure 6. Fluorescence spectra

In the dark-adapted eye, red light is recognized as red over an area whose radius is three or four times that observed with green light; yet the red light is not seen at all outside this larger area. On the other hand, green or blue light, whilst it is only recognizable as green over the much more restricted central area, is seen as a bright light of a dazzling white type over a very extensive area.

The Hardy spectrophotometer (*11*) has been adapted to the measurement of the color of the light emitted by phosphors. Rothchild (*8*) located the centers of the emission bands of phosphors by recording the fluorescence spectrum on a photographic film. This method requires no unusual equipment. The sample is irradiated by a suitable source and the emitted light is passed through a filter to remove any reflected ultraviolet and then through a spectrometer, finally recording the spectrum on the photographic plate. The assembly is shown in Figure 5, and an example of the results in Figure 6. In order from top to bottom the spectra represent an unfiltered mercury arc as diffused into the spectrometer from a block of $MgCO_3$, red, yellow, yellow-green, green, blue-green, and blue fluorescent pigments. The

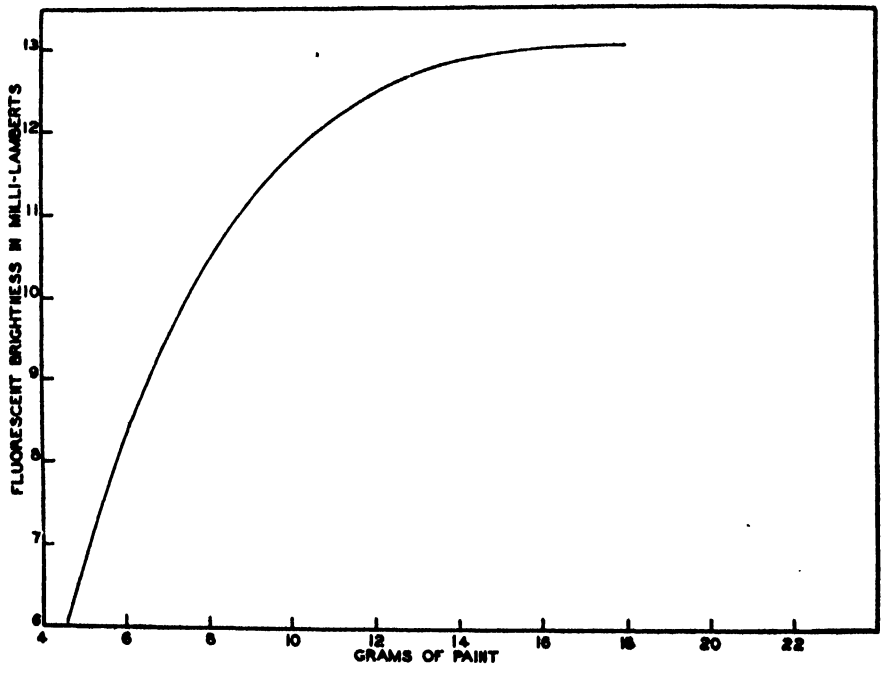

Figure 7. Fluorescent covering power

Table I

Pigment	Vehicle	Exposure	Relative Order of Fluorescence After Exposure	% of Original Fluorescence	Relative Order of Phosphorescence After Exposure	% of Original Phosphorescence
Phosphorescent ZnS	Traffic vehicle	Vertical, 14 months	2	43	2	65
Fluorescent ZnS (green)	Resin modified (nitrocellulose) lacquer	45° south, 12 months	4	50	..	..
Phosphorescent ZnS	Resin modified (nitrocellulose) lacquer	45° south, 12 months	1	35	1	40
Fluorescent ZnS (blue)	Sign enamel	45° south, 14 months	9	20	..	..
Fluorescent ZnS (green)	Sign enamel	45° south, 14 months	6	20	..	..
Fluorescent ZnS (yellow)	Sign enamel	45° south, 14 months	5	30	..	..
Fluorescent ZnS (red)	Sign enamel	45° south, 14 months	8	25	..	..
Fluorescent Zn–CdS (yellow)	Sign enamel	45° south, 14 months	3	20	..	..
Fluorescent Zn–CdS (red)	Sign enamel	45° south, 14 months	10	35	..	..
Fluorescent ZnS (yellow)	Polystyrene	45° south, 13 months	7	35	..	..

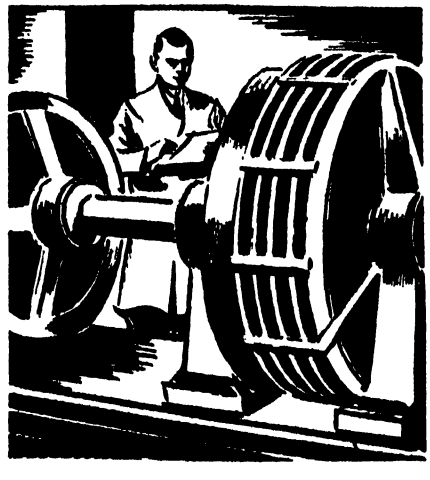
red and yellow fluorescence spectra in this figure represent essentially pure spectrum colors.

Covering Power

When the fluorescent brightness of a luminescent paint is plotted against the film thickness, the resulting curve has the same form as the brightness or contrast ratio, film thickness curves, the familiar hiding power curves, for normal paints. Figure 7 shows an example of this for a paint pigmented with phosphorescent zinc sulfide and applied over a priming coat of white paint.

The composition of this paint follows:

Pigment—62 per cent	
Phosphorescent zinc sulfide	100 per cent
Vehicle—38 per cent	
Glyptal solution (General Electric Co. No. 2475)	71.7 per cent
Mineral spirits	26.4 per cent
Drier	1.9 per cent



Complete luminescence was obtained under these conditions with this paint at a spreading rate of 400 square feet per gallon, corresponding to 44 square feet per pound of pigment. When a fluorescent zinc–cadmium sulfide pigment was used as the pigment in the above composition the spreading rate for complete luminescence was 1,050 square feet per gallon or 115 square feet per pound of pigment. It was not possible to make a direct substitution with an alkaline earth sulfide pigment, but when 52 per cent of a calcium sulfide pigment was mixed with 48 per cent of the above vehicle the resulting paint reached its maximum fluorescence over a white primed surface at a spreading rate of 270 square feet per gallon, corresponding to 44 square feet per pound of pigment.

Durability

Little is known about what useful life should be expected from luminescent paints under the variety of conditions of use which may be encountered. The alkaline earth sulfide phosphors, particularly the strontium sulfide type, are rapidly decomposed by moisture and must be protected by a clear top finish of some sort, if even a few months' service is to be obtained. The zinc sulfide and zinc–cadmium sulfide phosphors are subject to light darkening, but otherwise are highly resistant to weathering. The results of some exterior exposures of paints pigmented with these pigments are summarized in Table I.

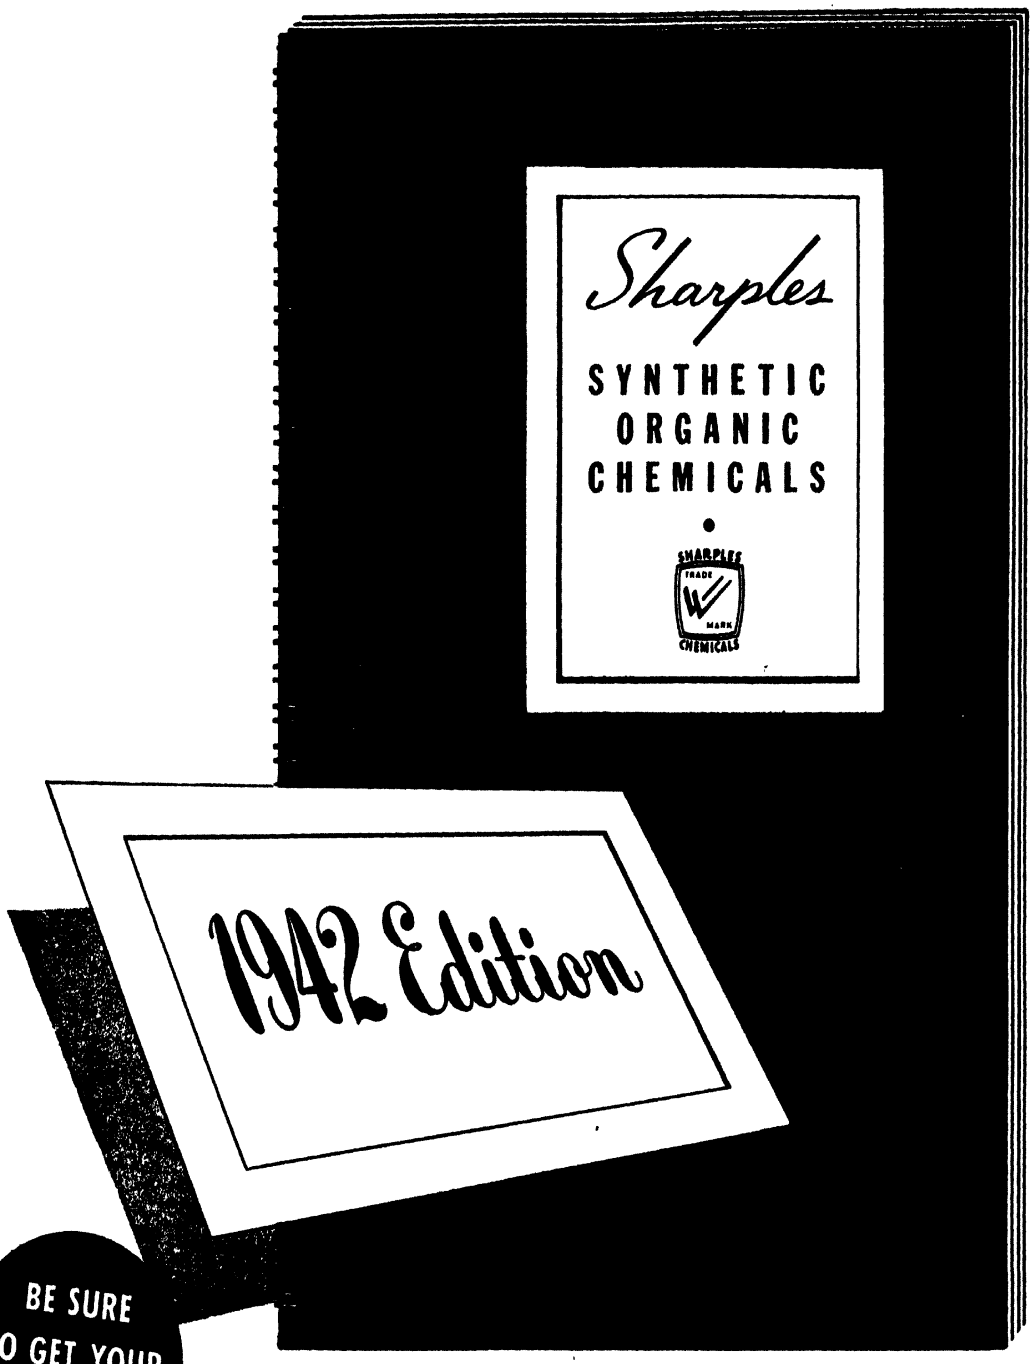
Research on Constructional Resins



In 1939 the Westinghouse Electric & Manufacturing Co. founded at Mellon Institute an industrial fellowship to conduct investigational work on plastics, especially synthetic resins, for constructional purposes. Since then the fellowship staff has been carrying on research on new raw materials, new molded products, and new processing methods, evaluating them for commercial application. In these activities particular emphasis has been placed on the employment of plastics in those fields where the uses of resinous materials are unknown, limited, or undeveloped.

Following the completion of this basic research program two specialists, H. Ross Strohecker and William B. Johnston, will conduct the subsequent investigational and developmental work of the fellowship. Mr. Strohecker will give attention to the physical technology involved and Mr. Johnston will perfect the chemical processing. These plasticians will have the direct and constant cooperation of experts in the Westinghouse organization.

High-Tenacity Rayon in Army Tires Conserves Rubber

America's Army is rolling to war on rubber—and on rayon. Cordura rayon, an all-American development using only American raw materials, has been conserving important tonnages of the limited rubber supplies on hand. Possessing greater strength than other tire fabric beyond experimental stages and retaining its great strength under the high heat of heavy-duty driving, this rayon permits tires to have thinner but stronger walls and adds miles to their lives.

The high-strength yarn, developed by du Pont chemists is in demand in smaller diameter threads for parachutes used to drop flares, ammunition, and other military supplies. The government is taking the entire output, with producers increasing capacities as rapidly as facilities can be converted or expanded.

BE SURE TO GET YOUR COPY

The 13th Edition of "Sharples Synthetic Organic Chemicals" is just off the press. This Booklet contains useful information on more than 150 Sharples Products, presented in such a form that it should serve as a buying guide as well as for technical reference. If you have not received your copy, one will be sent on request.

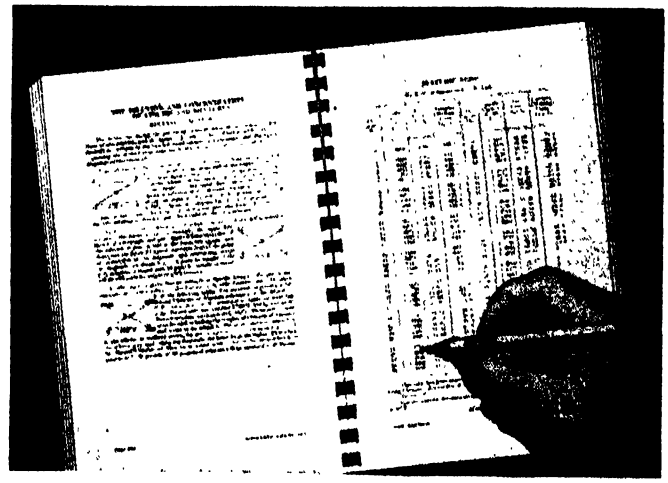
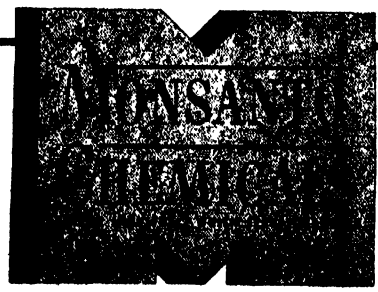
CHEMICAL AND ENGINEERING NEWS



USEFUL DATA you'll want at your fingertips



1. Here is information on Monsanto's complete line of products arranged in handy, ready-reference form to save you time and trouble in finding exactly what you want . . . when you want it.

2. Included in the 170 pages of this new edition of the Monsanto products book you will find structural formulas . . . accurate descriptions of physical and chemical characteristics . . . brief data on uses that will often tell you at a glance whether or not a specific material gives promise of meeting your needs . . . and a complete list of all available Monsanto technical literature.

3. Also included are 25 pages filled with useful general data and tables like these. To have this time and trouble-saving information at *your* fingertips, simply write today on your business letterhead for a copy of your 26th edition of "Monsanto Chemicals." MONSANTO CHEMICAL COMPANY, Organic Chemicals Division, St. Louis, Missouri. District Offices: New York, Chicago, Boston, Detroit, Charlotte, Birmingham, Los Angeles, San Francisco, Montreal.

"E" For Excellence—The Navy "E"—denoting the highest service accomplishments of the United States Navy—awarded to Monsanto December 31, 1941, "in recognition of production of ordnance materiel vital to our national defense."

Program of the Buffalo Meeting of the American Chemical Society

September 7 to 11, 1942

General Program

Sunday, September 6

2:00 to 9:00 P. M.—Registration, Palm Court, Hotel Statler.
4:00 to 10:00 P. M.—Social gathering, Terrace Room, Hotel Statler; movies at 4:00 and 8:00 P. M.

Monday, September 7

8:00 A. M. to 6:00 P. M.—Registration.
9:30 A. M.—Council meeting (for Councilors only), Ballroom, Hotel Statler.
2:00 P. M.—Divisional meetings.
6:30 P. M.—Group dinners.
8:30 P. M.—Public meeting, Kleinhans Music Hall (see page 1018). Transportation by bus from Genesee Street entrance, Hotel Statler. Fare, 10 cents or three tokens for 25 cents.

Music by **Buffalo Philharmonic Orchestra,** Franco Autori, conductor.
Nelson Allen, Chairman of the Buffalo Meeting, presiding.
Joseph J. Kelly, Mayor, City of Buffalo, **"Welcome to Buffalo".**
Harry N. Holmes, President of the AMERICAN CHEMICAL SOCIETY, **"National Survival through Science".**
C. M. A. Stine, E. I. du Pont de Nemours & Co., Inc., **"Molders of a Better Destiny".**
Admission by ticket (no charge) which must be obtained at registration headquarters before 6:00 P. M. Monday.

Tuesday, September 8

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.
5:00 P. M.—Social hours.
6:30 P. M.—Group dinners.
8:00 P. M.—County Fair, Memorial Auditorium. Admission by ticket (no charge) which must be obtained at registration headquarters before 6:00 P. M. Tuesday.

Wednesday, September 9

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
12:15 P. M.—Group luncheons.
2:00 P. M.—General meeting, Memorial Auditorium.

Presentation of the **Women's Award in Chemistry (Garvan Medal)** to **Florence B. Seibert.** Award address before the Division of Biological Chemistry, Thursday, 11:20 A. M., Chinese Room, Hotel Statler, see page 1032.
Presentation of the **AMERICAN CHEMICAL SOCIETY Award in Pure Chemistry (sponsored by Alpha Chi Sigma)** to **John Lawrence Oncley.** Award address before the Division of Physical and Inorganic Chemistry, Thursday, 2:00 P. M., Room M, Hotel Statler, see page 1048.
Edward R. Weidlein, Mellon Institute of Industrial Research, **"Progress of Synthetic Rubber Production".**
Albert L. Elder, War Production Board, **"Progress of Butadiene Production".**
Willard Dow, Dow Chemical Co., **"Progress of Styrene Production".**
"The Outlook on the Rubber Situation."

7:30 P. M.—Subscription dinner (dress optional), Ballroom, Hotel Statler. **Lieutenant-General William S. Knudsen** will speak on **"The War Production Effort".** Tickets, **$3.50** each, must be secured at registration headquarters before 12:00 M. Wednesday. Attendance limited to 800. (see page 1022).
10:00 P. M.—Dance, Ballroom, Hotel Statler. Admission by badge.

Thursday, September 10

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
11:30 A. M.—Automobiles leave Delaware Avenue entrance, Hotel Statler, for the A. C. S. Golf Tournament at Niagara Falls Country Club. Golfers' lunch at 12:30 P. M. Play starts at 1:30 P. M. Tickets may be obtained at registration headquarters until 6:00 P. M. Wednesday.
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.
3:00 to 10:00 P. M.—Inspection trip to Niagara Falls, including both American and Canadian Falls. Picnic supper in Queen Victoria Park, Canada. Special illumination of the Falls from 7:30 to 10:00 P. M. Tickets for transportation and supper, $2.00 each, and for special side trips must be purchased at registration headquarters not later than 6:00 P. M. Wednesday. Those taking this trip must be familiar with the pertinent regulations governing Canadian travel. For further particulars, see pages 1018 and 1020.
6:30 P. M.—Group dinner.

Friday, September 11

9:00 A. M.—Divisional meeting.
1:30 P. M.—Divisional meeting.

Local Committee Chairmen

Office, Grover Cleveland Room, Mezzanine Floor, Hotel Statler.

CHAIRMAN. Nelson Allen.
VICE CHAIRMAN. Wilmer H. Koch.
SECRETARY. Hans O. Kauffmann.
EXECUTIVE COMMITTEE. Nelson Allen, Lawrence H. Flett, Hans O. Kauffmann, Wilmer H. Koch, Howard W. Post, and J. Frederic Walker, Jr.
ENTERTAINMENT. Raymond R. Ridgway.
FINANCE. Max E. Bretschger.
GOLF. Joseph S. Reichert.
GROUP MEALS. Warren K. Eglof.
HOTELS AND HOUSING. Edward F. Wesp.
INFORMATION. James H. Crowdle.
LADIES' ENTERTAINMENT. Margaret C. Swisher.
MEETING PLACES AND EQUIPMENT. Ralph B. Elliott, Electrochemicals Department, E. I. du Pont de Nemours & Co., Inc., Niagara Falls.
PLANT VISITS. Robert L. Murray.
PRINTING. Walter M. Buehl.
PUBLICITY. Robert M. Fowler.
RECEPTION. Lester F. Hoyt.
REGISTRATION. George W. Fiero.
SIGNS. George E. Symons.
STUDENTS. Groves H. Cartledge.
SUBSCRIPTION DINNER. Albert E. Jennings, Jr.
TRANSPORTATION. Donald E. Drew.

Announcements

All events are on Eastern Wartime.

LOCATIONS OF MEETINGS. Meeting activities will center around the Hotel Statler, Delaware Avenue and Niagara Square. Registration, most divisional meetings, and certain social events will be held there. Technical sessions also are scheduled for the Lafayette Hotel, the Y. M. C. A., the University of Buffalo, and the Police Academy. The public meeting on Monday evening will be held in Kleinhans Music Hall. The Memorial Auditorium will be used for the general meeting on Wednesday afternoon and the County Fair on Tuesday; the Auditorium is eight blocks from the Hotel Statler.

REGISTRATION AND REGISTRATION FEE. The registration headquarters of the meeting will open at 2:00 P. M. Sunday

in the Hotel Statler. The procedure starts in the Palm Court on the main floor and is completed on the mezzanine. The registration fee, required by vote of the Council to help carry local expenses, has been fixed at $3.00 for members and visitors other than American nonmember chemists and chemical engineers; $8.00 for American nonmember chemists and chemical engineers. Associate members of divisions or of local sections are not members of the AMERICAN CHEMICAL SOCIETY and, if chemists or chemical engineers, are subject to the $8.00 fee. Chemical students, both graduate and undergraduate, are given the courtesy of registration on exactly the same basis as members of the SOCIETY. All members and guests must register to help carry the expense of the meeting. Special registration facilities for the convenience of rubber chemists will be provided at the Hotel Lafayette on Wednesday and Friday from 8:30 A. M. to 12:00 M. and on Thursday from 8:30 A. M. to 5:30 P. M.

BADGES. It is important that official badges be worn at all times, since admission to divisional meetings and to certain of the events on the entertainment program is by badge only.

INFORMATION. The Information Committee will maintain a booth on the main lobby floor of the Hotel Statler. It will be open from 12:00 M. to 10:00 P. M. Sunday and from 9:00 A. M. to 6:00 P. M. daily thereafter. Information on transportation, trips, points of interest, places to eat, etc., will be available. Improperly addressed mail and telegrams will be held at this booth. A lost and found service will be maintained.

HOUSING. A representative of the Hotels and Housing Committee will be in the Information Booth, lobby floor, Hotel Statler, from 12:00 M. to 10:00 P. M. Sunday and 9:00 A. M. to 10:00 P. M. Monday through Wednesday. He will assist those without hotel reservations in finding suitable accommodations.

TRANSPORTATION. Hotels and meeting places are within walking distance of each other and adjacent to streetcar and bus lines. Bus and streetcar fares are 10 cents per ride or 25 cents for three rides to all points in the city. Taxi fares are 50 cents for the first 2 miles and 5 cents for each additional one-fourth mile and do not vary with number of passengers.

Busses leave all downtown intersections of Main Street and trains depart from the Terrace Street station at frequent intervals for Niagara Falls. Trip time is about one hour. Round trip fares are 89 cents by bus and $1.16 by train.

City maps and travel information will be available at the Information Booth in the Hotel Statler lobby.

Gasoline will be rationed in the Buffalo area before the time of the meeting.

PARKING. Open-air lots charge from 15 to 25 cents for all-day parking. Parking on the streets in the downtown area is regulated by meters which operate from 8:00 A. M. to 6:00 P. M., with a charge of 5 cents for one hour. Do not insert more than one coin in the meter, as only one hour's parking time will be obtained. Additional coins must be deposited each hour.

MAIL. Mail and telegrams should be sent to the hotel where stopping. Communications addressed in care of the AMERICAN CHEMICAL SOCIETY cannot be delivered to the individual but will be held at the A. C. S. Information Booth in the lobby of the Hotel Statler. The SOCIETY accepts no responsibility for delivery of mail. After each national meeting, some mail and telegrams remain undelivered. Therefore, as a matter of precaution, convention attendants should inquire for mail at the A. C. S. Information Booth regardless of their local address.

TICKETS. Tickets for all events should be purchased as far in advance as possible in order to permit the committee to make proper arrangements. This is especially true for transportation and events on the Ladies' Program.

LOUNGE. Because of the anticipated congestion in the lobby and public space of the Hotel Statler, the Terrace Room will be open from 5:30 until 8:00 P. M. each day for the exclusive use of registrants and their guests. This offers a splendid opportunity to get together with friends during the time between the technical sessions and the evening program. Refreshments may be purchased.

EQUIPMENT FOR MEETING ROOMS. Divisional meeting rooms will be equipped with a standard lantern-slide projector, screen, pointer, blackboard, chalk, reading stand, reading light, table, and ice water. Each divisional secretary should contact his local assistant and inspect the assigned meeting room before the first session of the division. Please direct all correspondence concerning meeting rooms to Ralph B. Elliott, Electrochemicals Department, E. I. du Pont de Nemours & Co., Inc., Niagara Falls, N. Y.

ABSTRACTS. The A. C. S. News Service, 1155 Sixteenth St., N. W., Washington, D. C., can supply a limited number of sets of abstracts of papers presented at the Buffalo meeting at 50 cents per set to those submitting receipt for divisional dues; $1.00, to others who remit with order; $1.25, to those who fail to send cash with order; and $1.50, to those requiring bills to be rendered. The abstracts will be as furnished by the authors and will be mailed as soon as possible. Copies will also be on sale at Buffalo.

PRESS. The AMERICAN CHEMICAL SOCIETY News Service will maintain press headquarters in Room 350, Hotel Statler.

OFFICES. Mezzanine Floor, Hotel Statler.
AMERICAN CHEMICAL SOCIETY, National Secretary, Room 15.
INDUSTRIAL AND ENGINEERING CHEMISTRY, Room 15.
LOCAL COMMITTEE, Grover Cleveland Room.

WOMEN CHEMISTS. Headquarters for the women chemists will be in the Ballroom Foyer, Main Floor, Hotel Statler. An attendant will be present throughout the meeting to welcome guests, register them for the files of the Women's Service Committee, and provide information.

A luncheon in honor of Florence B. Seibert, Garvan Medalist, will be held in the Mahogany Room of the Hotel Lafayette at 12:15 P. M. Wednesday, September 9. Dr. Seibert will speak on "Experiences in the Chemistry of Disease". Because of the special nature of this luncheon, it will be open to all interested registrants, both men and women. Tickets, $1.50 each, must be secured in registration headquarters before 9:30 A. M. Wednesday.

Iota Sigma Pi will hold a breakfast in Parlor B, Hotel Statler, at 7:30 A. M. Tuesday, September 8. Tickets, $1.10 each, must be secured in registration headquarters before 6:00 P. M. Monday.

Women chemists are invited to attend all of the events scheduled on the Ladies' Program (see page 1026).

LADIES' HEADQUARTERS. Ballroom Foyer, Main Floor, Hotel Statler.

GROUP OF DIVISIONAL OFFICERS. This group will meet for breakfast Thursday at 7:30 A. M. in Parlor A of the Hotel Statler. Tickets, $1.10 each, must be purchased before 6:00 P. M. Wednesday. Howard I. Cramer, Secretary.

GROUP OF LOCAL SECTION OFFICERS. A breakfast for this group will be held Tuesday at 7:30 A. M. in the Washington Room of the Hotel Touraine. Tickets, $1.00 each, must be purchased before 6:00 P. M. Monday. F. O. Rice, Chairman; Auburn A. Ross, Secretary.

Hotels

Hotel Statler, Niagara Square, has been designated as headquarters for the meeting. Hotel Lafayette, Washington and Clinton Streets, will be headquarters for the Division of Rubber Chemistry.

All official hotels are in or near the theater, shopping, and business district. They are readily accessible to all railway stations and steamer landings by taxicab, bus, or street car.

Requests for reservations should be sent *at once* to Edward F. Wesp, Chairman, A. C. S. Hotels and Housing Committee, Buffalo Convention and Tourists Bureau, Genesee Building, Buffalo, N. Y. Please use the hotel reservation form on page 1016, giving all the data requested.

Because of the present large demand for hotel rooms in Buffalo, *it is imperative that reservations be made immediately.* For the same reason, *double occupancy* of rooms *is desirable.* Since defense activities are making a heavy call on Buffalo hotels, the convenience of a single room should be sacrificed as a patriotic contribution. It is in this spirit that the Hotels Committee asks that (1) hotel reservations be made early, giving the dates of arrival and departure, and (2) persons arrange to share double rooms.

Rooms for students will be available at $1.45 per day and up.

Hotels

	Rates		
	For One Person[a]	For Two Persons	Suites
OFFICIAL[b]			
Statler	$3.30 to $6.60	$5.50 to $11.00	$ 9.00 to $18.00

A STRONG CHEMICAL INDUSTRY

Accepts the Challenge

This war we are fighting presents a challenge to our chemical industry!

Production of existing chemicals has had to be stepped up to unforeseen tonnages. New chemicals, particularly in the synthetic group, have had to be worked out in the laboratory and then translated into full-scale production . . . *quickly*.

War has flung down the gauntlet, and industry has accepted the challenge.

Much of the underlying strength of the nation's chemical industry can be traced to the soundness of engineering designs and skill in construction contributed by independent, unbiased engineering and construction services.

Badger Engineers and Constructors are proud to be among those serving the chemical industry at this time . . . serving it by designing and building efficient plants and units in—under existing handicaps—record time.

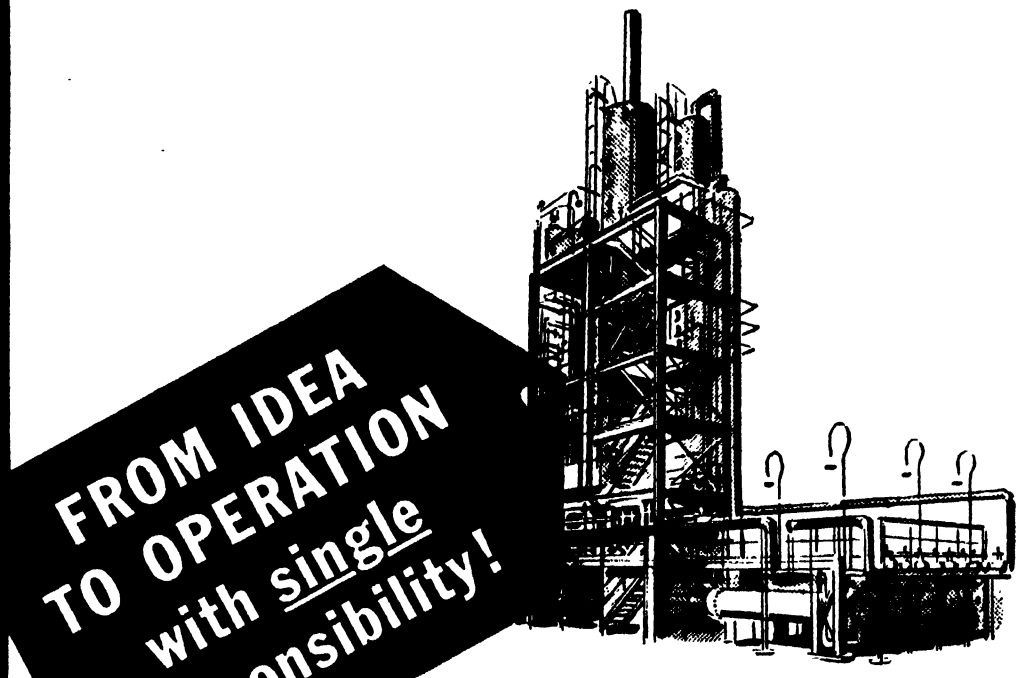
Group Meals

Quoted prices include tips; any solicitation made at the tables should be refused. The deadlines for the purchase of tickets at registration headquarters on the mezzanine floor, Hotel Statler, are as follows: breakfasts, 6:00 P. M. of the preceding day; luncheons, 9:30 A. M.; dinners and social hours, 2:00 P. M. Meals will be ordered on the basis of sales before these times. In order to cover the cost of rearrangements, *a service charge of 15 cents will be added to the stated price for each meal if the ticket is not purchased before the deadline.* No refunds will be made on tickets after the deadline.



The hotels reserve the right to transfer to special tables in their regular dining rooms any group meals for which fewer than 15 tickets have been sold at the deadline hour.

Public Meeting

A meeting of interest to all convention registrants has been scheduled for Monday evening. It has been planned to combine entertainment and a period of serious thought.

The session will open with music by the Buffalo Philharmonic Orchestra, Franco Autori, conductor. Nelson Allen, chairman of the Buffalo meeting, will preside over the program which follows. This will include the official welcome to the City of Buffalo by its Mayor, the Honorable Joseph J. Kelly. Harry N. Holmes will deliver his Presidential Address, "National Survival through Science". C. M. A. Stine, vice president and member of the executive committee of E. I. du Pont de Nemours & Co., Inc., will speak on "Molders of a Better Destiny". Because of the importance of this meeting, it will be open to the public.

This program will be held in the new Kleinhans Music Hall, about a mile and one half from the Hotel Statler. The building is famous among architects for its modern treatment of the functional idea in architecture. It has been designed from the standpoint of perfect acoustics and lines of sight. Its architectural beauty is not surpassed by any similar building on this continent. The committee has arranged to have the lounge facilities of the building open. From 7:00 to 8:30 o'clock opportunity will be given to the registrants to inspect the various features of the hall which include practice rooms, chamber music room, and the library.

Trips

Because of wartime regulations affecting industrial plants working on government contracts, it has been impossible to arrange plant trips for attendants at the Buffalo meeting. Rather than offer a few trips of very limited interest and omit the large plants of which every chemist has heard, no trips are scheduled. Buffalo chemists regret that they are unable to continue this interesting feature of national meetings.

Niagara Falls

NOTE. It is important that anyone planning to visit Niagara Falls read carefully all of the material that follows.

No visit to Buffalo is complete without an inspection trip to Niagara Falls. Since most registrants will wish to capitalize on their nearness to this beautiful and inspiring spot, seven trips have been arranged. Although there is a limit on the number of participants in each, it is hoped that everyone wishing to visit the Falls can be accommodated at some time during the week. Except for the trip Thursday afternoon, these expeditions are announced only in the Ladies' Program, page 1026; but it should be understood that both men and women are invited to participate in all of them. The schedule follows:

Event No.	Day	Time	Limit	Price	Ticket Deadline
50	Wednesday	10 A. M. to 4 P. M.	150	$3.00[a]	5 P. M. Tues.
75	Wednesday	4 P. M. to 10 P. M.	150	3.25[b]	5 P. M. Tues.
79	Thursday	10 A. M. to 4 P. M.	150	3.00[a]	5 P. M. Wed.
87	Thursday	3 P. M. to 10 P. M.	500	2.00[c]	5 P. M. Wed.
88	Thursday	4 P. M. to 10 P. M.	150	3.00[c]	5 P. M. Wed.
90	Friday	10 A. M. to 4 P. M.	150	3.00[a]	5 P. M. Thurs.
91	Friday	4 P. M. to 10 P. M.	150	3.25[b]	5 P. M. Thurs.

[a] Transportation and lunch.
[b] Transportation and dinner.
[c] Transportation and picnic.

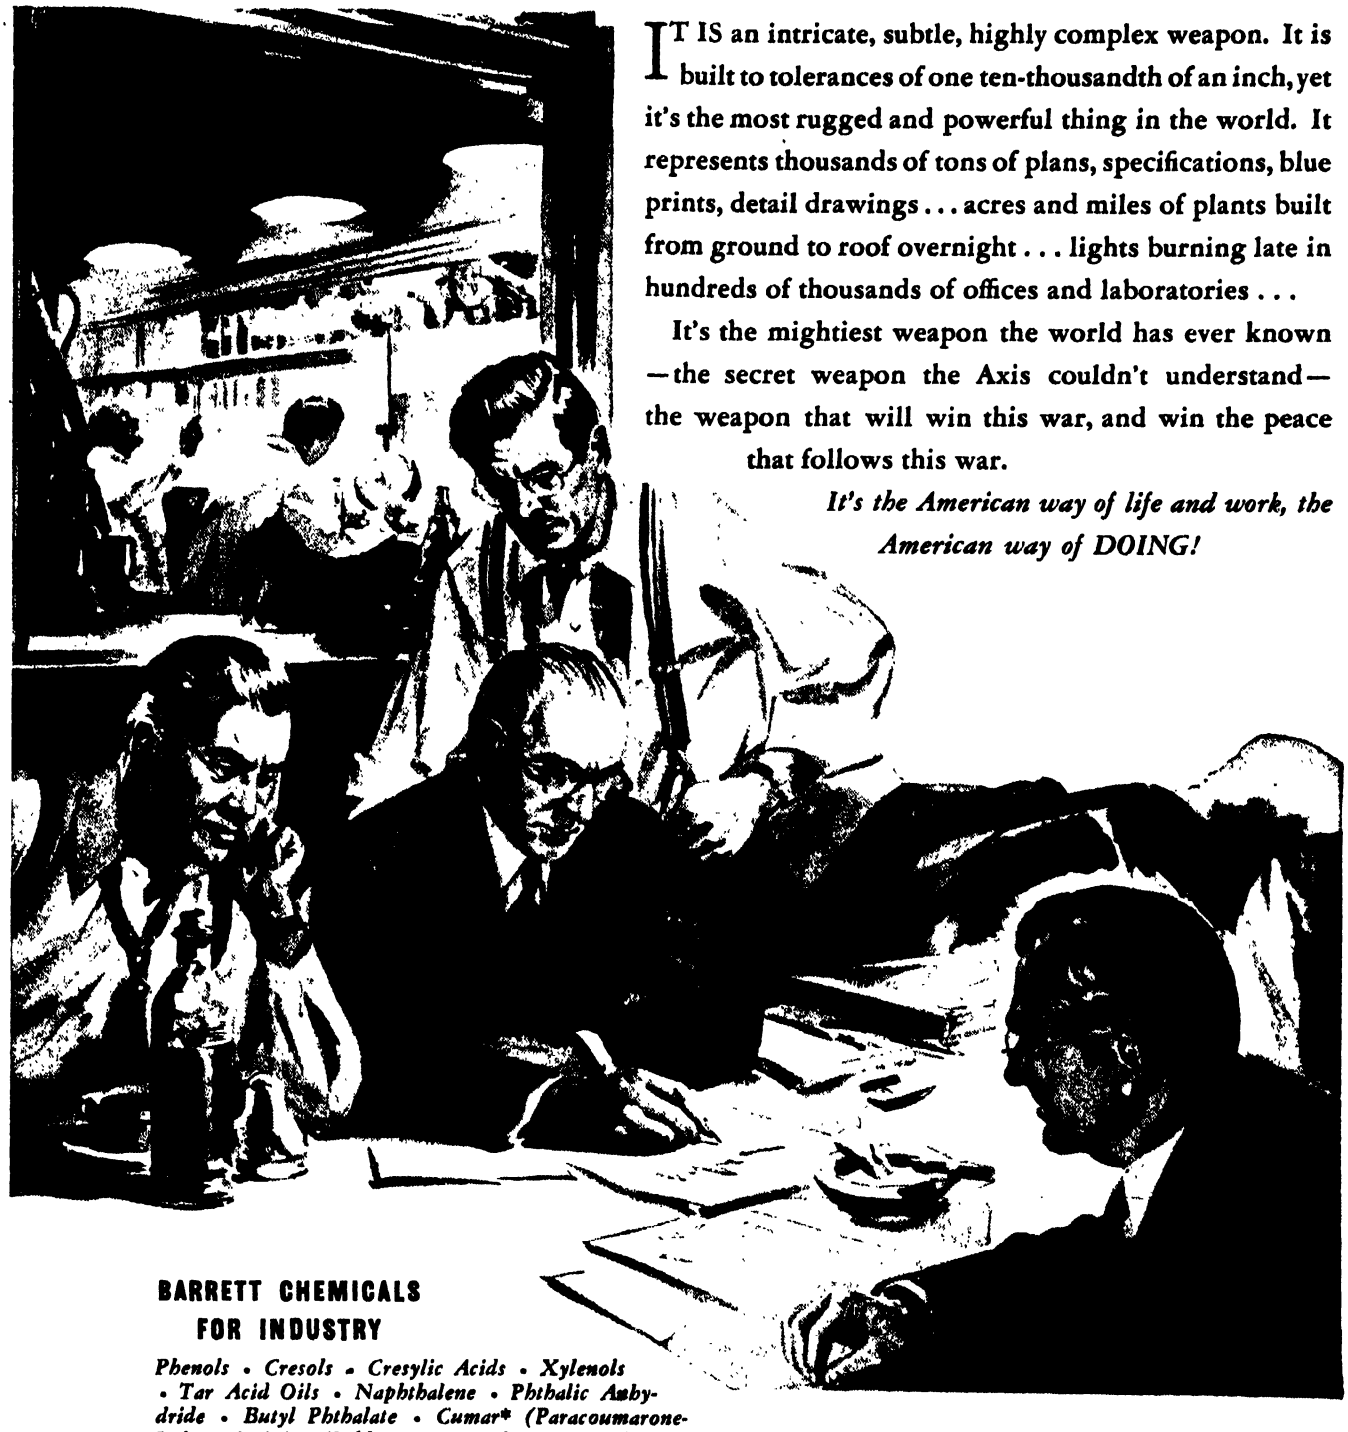
All trips will be by taxicab leaving from the Delaware Avenue entrance of the Hotel Statler except No. 87; for that, busses will start from the corner of Main and Genesee Streets promptly at 3:00 P. M. Thursday. Arrival in Niagara Falls is approximately one hour later.

Because of the necessity of conserving tires, it will not be possible to provide cars for transportation at Niagara Falls to the various points of interest on the American and Canadian sides of the river on trip No. 87 leaving at 3:00 P. M. Thursday. Those who plan to take this trip should understand that it will be necessary to walk short distances. The walking will not exceed a total of four and one-half miles in short stretches with a minimum of 1.8 miles if side trips are eliminated.

The morning trips (Events No. 50, 79, and 90) will be over the Peace Bridge and down the Canadian side of the river to the Falls. The 4:00 P. M. trips (Events No. 75, 88, and 91) will go down the American side and back the Canadian. For the 3:00 P. M. Thursday trip (Event No. 87) participants will be taken to Niagara Falls and will return on the American side, but they will cross into Canada at the Falls. Luncheon will be served in the Park Restaurant in Queen Victoria Park, Niagara Falls, Ontario, Canada, to participants in Events No. 50, 79, and 90, dinner to those who select Events No. 75 and 91, and a picnic supper to persons making trips No. 87 and 88. From this point, there is a lovely view of the Falls.

All afternoon tours, Events No. 75, 87, 88, and 91, are timed so that participants may see a special illumination of the Falls from 7:30 to 10:00 P. M. planned especially for the guests of the Western New York Section of the A. C. S.

Time has been allowed so that those who wish to engage in some of the customary side trips at the Falls may do so. For these trips there are extra charges, *but* special rates have been set for registrants at this meeting. These rates are available *only* on tickets purchased at registration headquarters. Therefore, it is important that each person determine, in advance, his participation in these side trips. Prices are as follows:



Maid of the Mist boat trip to Horseshoe Falls	65 cents
Elevator to the river's edge at Whirlpool Rapids (not on Event No. 87)	25 cents
Trip to the Cave of the Winds	75 cents

All trips include an opportunity to see the new Rainbow Bridge, the Maid of the Mist, Queen Victoria Park, Oakes Garden, and Goat Island. Additional points included in Events No. 50, 75, 79, 88, 90, and 91 are the Peace Bridge, the Whirlpool Rapids, and General Brock's monument.

The Peace Bridge across the Niagara River, connecting the heart of Buffalo with Fort Erie, Ontario, Canada, was opened by the Prince of Wales in 1927. Three decades ago the Queen Victoria Niagara Falls Park Commission, then in control of the Canadian side overlooking the Falls, took over the whole river front from Lake Erie to Lake Ontario. The boulevard drive along this river is one of the most beautiful in America, rich in both natural splendor and historic interest. Of the many small bridges

THE *Secret Weapon the Axis Couldn't Understand!*

IT IS an intricate, subtle, highly complex weapon. It is built to tolerances of one ten-thousandth of an inch, yet it's the most rugged and powerful thing in the world. It represents thousands of tons of plans, specifications, blue prints, detail drawings . . . acres and miles of plants built from ground to roof overnight . . . lights burning late in hundreds of thousands of offices and laboratories . . .

It's the mightiest weapon the world has ever known —the secret weapon the Axis couldn't understand— the weapon that will win this war, and win the peace that follows this war.

It's the American way of life and work, the American way of DOING!

ONE OF AMERICA'S GREAT BASIC BUSINESSES

crossing the highway, no two are of the same material and design. Although it is impossible to reach the edge of the Horseshoe Falls because of wartime restrictions, the Maid of the Mist takes passengers up the river to the foot of these falls where one can see, hear, and feel the beautiful blue green water, the mighty roar and power of the great Niagara. The Canadians have long been known for their formal gardens. Overlooking the Falls are the beautiful Queen Victoria Park and the lovely new Oakes Garden. Replacing the Honeymoon Bridge, which fell into the Niagara River in 1938, is the new Rainbow Bridge which joins Niagara Falls, N. Y., with Niagara Falls, Ontario. Using the Whirlpool Rapids Elevator or walking down a trail, one can reach the lower rapids of the river where the water is as deep as the gorge walls are high and the water boils and foams over the giant boulders beneath.

Since all of these trips include Canadian travel, everyone who contemplates participation must comply with the regulations for Canadian visitors. (See regulations for Canadian visitors below.)

Owing to present conditions, these trips are subject to cancellation or change by government order affecting transportation.

Other Inspection Trips

The Ladies' Program includes visits to the Albright Art Gallery, Buffalo Museum of Science, Buffalo Historical Society, and Lockwood Memorial Library (University of Buffalo). These are described on page 1028. All persons interested, men or women, are invited to participate. Details concerning time, transportation charge, and deadline for sale of tickets will be found in the Ladies' Program, page 1026.

Canisius College

Canisius College extends a cordial invitation to members of the AMERICAN CHEMICAL SOCIETY and their guests to visit the new Horan-O'Donnell Science Hall on the campus at Main Street and Jefferson Avenue. This modern chemistry and physics building, opened three years ago, is considered one of the finest science buildings in western New York. The building will be open during the meeting for visits and inspection. Take a No. 8 or No. 9 streetcar north on Main Street to Jefferson Avenue.

Regulations for Canadian Visitors

All persons taking any of the Niagara Falls trips or planning to enter Canada at any other time must observe the following regulations:

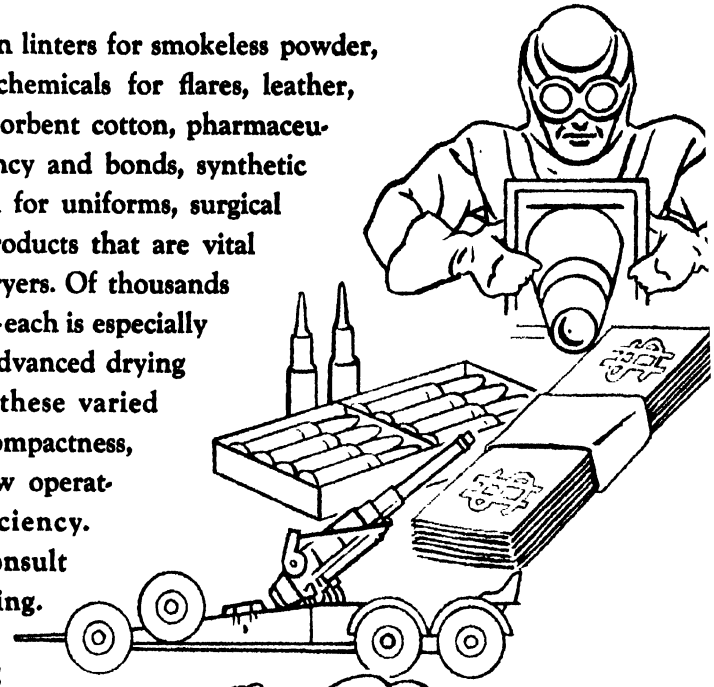
IMMIGRATION AND CUSTOMS. If born in the United States, no documentary evidence is necessary. If not born in the United States but a naturalized citizen of this country, the naturalization certificate must be presented at the border. If not born in the United States and not a naturalized citizen of this country but a legal resident alien, application must be made to the immigration office nearest your home and a resident border-crossing card obtained.

CAMERAS. Exposed film is collected from all persons crossing the Canadian border. It is advisable to start the trip with an empty camera and complete the roll of film before leaving Canada. The film will be developed, censored, and mailed to the owner, C. O. D. Movie film will be sent to the Eastman Kodak Co. Cameras of foreign make must be registered at the custom's office at the border.

Entertainment

The convention attendants and their guests will be welcomed on Sunday at the Hotel Statler by a Reception Committee. Movies and other entertainment features have been provided for Sunday afternoon and evening in the Terrace Room of the Hotel Statler.

The County Fair on Tuesday night will be held at the Memorial Auditorium, within easy walking distance of the Hotel Statler. With the advent of tire and gas rationing, transportation difficulties have beset the oldtime county fair. Accordingly, in the spirit of cooperation, the committee is bringing the fair to the convention, rather than taking the convention attendants to the fair. There will be shooting galleries, rides, dancers, magicians, jugglers, trained seals, freaks, and the music of a popular orchestra. The fair will start at 8:00 o'clock and will last until 12:00, after which there will be dancing with hostesses for those who do not want to go home. The committee invites the visitors to come to the Auditorium to relax or to be stimulated as the spirit moves them. There will be strenuous entertainment adjusted to suit all tastes from the highest to the lowest. Come to the fair as the guests of the local committee, knowing that amusement will not be rationed. Tickets (no charge) must be obtained at registration headquarters before 6:00 P. M. Tuesday.



On Wednesday, following the subscription dinner, there will be dancing from 10:00 until 2:00 in the Ballroom of the Hotel Statler. All persons wearing the convention badge will be admitted. Music will be furnished by Jack Valentine's well-known orchestra. This

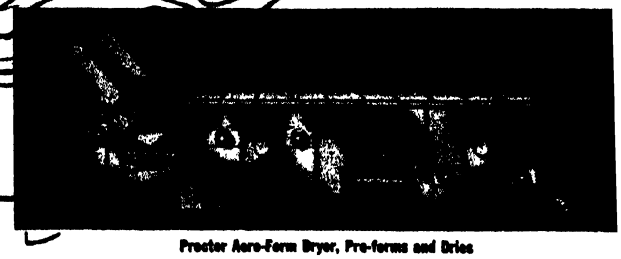
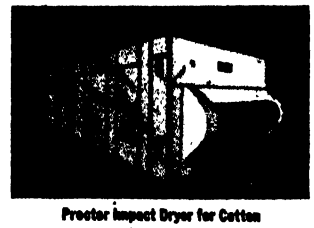
Drying



DRIES THOUSANDS OF DIFFERENT PRODUCTS THAT ENTER INTO THE PRODUCTION OF WAR MATERIALS

Motion picture films for sea plane tenders, cotton linters for smokeless powder, veneer for airplanes, tracer bullet mixtures, chemicals for flares, leather, textiles, chemicals, cartridge cases and shells, absorbent cotton, pharmaceuticals, tetryl for bombs, gun wads, paper currency and bonds, synthetic rubber, foodstuffs, primer parts, dyestuffs, wool for uniforms, surgical gauze, and many, many other widely varied products that are vital to the war effort are being dried on Proctor Dryers. Of thousands of Proctor Dryers now in use—each is different—each is especially designed to do a particular job the best that advanced drying knowledge says the job can be done. Yet all these varied machines have certain things in common . . . compactness, sturdy construction, freedom from trouble, low operating and upkeep costs, and all-around efficiency. Which are essentials in today's scheme. Consult Proctor & Schwartz if it's a matter of drying.



PROCTOR & SCHWARTZ · INC

Proctor Aero-Form Dryer, Pre-forms and Dries Wet-Solid Chemicals

Proctor Impact Dryer for Cotton

Proctor Dryer for

orchestra is famous for its performance of rhumba music and there will be demonstrations of the proper rhumba technique to warm the hearts of our South American friends. A plentiful supply of charming hostesses, skilled in dancing anything from the rhumba and Viennese waltz to the conventional two step, will be provided. A feature of the party will be the institution of the "Hag Line", the women will do the cutting, let the partners fall where they may.

Subscription Dinner

Those who do not attend the subscription dinner Wednesday, September 9, will miss an event of considerable importance. It is the climax to a day filled with timely addresses of great national significance. Everyone is familiar with the interesting history and accomplishments of the speaker of the evening, Lieutenant-General William S. Knudsen, Director of Production, Office of the Under-Secretary of War. General Knudsen will talk on "The War Production Effort". No one should miss this event and the opportunity to fraternize with other registrants at the meeting.

The capacity of the main floor of the beautiful ballroom of the Hotel Statler is approximately 800. Any reservations made in excess of this number must be accommodated in the balcony. Therefore, it is highly desirable to make reservations early. Tables for groups of 10 may be reserved at a special desk in registration headquarters. Tickets, $3.50 each, must be secured before 12:00 M., Wednesday. No refunds can be made on unused tickets, because of the nature of the contract with the Hotel Statler. Dress is optional.

Golf Tournament

The AMERICAN CHEMICAL SOCIETY Golf Tournament will be held Thursday, September 10, at the Niagara Falls Country Club, about 20 miles from downtown Buffalo. The *member* of the SOCIETY with the lowest gross score will receive the Wilson Cup. Other prizes, contributed by Buffalo and Niagara Falls business firms and hotels, will be awarded.

Transportation will be provided by Buffalo and Niagara Falls members, starting from the Delaware Avenue entrance of the Hotel Statler at 11:30 A. M. Luncheon will be served at the Club House. Play will begin about 1:30 P. M. Tickets, including luncheon, $1.00, and greens fee, $1.50, must be obtained from registration headquarters before 6:00 P. M. Wednesday. Save up your golf balls for this event.

Two other Buffalo golf courses, Wanakah and Orchard Park Golf Clubs, will be open to registrants for the entire week. The greens fee will be $1.50 per day at either course. The attendant at the Information Booth will tell golfers how to reach these clubs.

Students

The Buffalo meeting offers special features of interest and importance for students of chemistry and chemical engineering. All national conventions afford an opportunity to gain further insight into the professional aspects of the vocation and to become acquainted with the men and women who have built the profession to its present status, but the program of the Buffalo meeting promises to be unique in this respect.

In addition to the usual technical sessions of the many divisions, covering all branches of chemistry, the Division of Chemical Education has arranged a special program addressed to students but which no young chemist or chemical engineer, regardless of his student status, can afford to miss. Details of this program, which is scheduled for Wednesday morning, are given on page 1034.

The subject at present uppermost in the minds of students (and professors) is the relation of their work to the national emergency. Charles L. Parsons, Secretary of the AMERICAN CHEMICAL SOCIETY, will discuss the Selective Service regulations that affect students. No one is better qualified to present this material. Secretary Parsons has been working closely with Selective Service officials in order to enable chemists and chemical engineers to make their maximum contribution to the war.

The remaining papers on the special Wednesday student program deal with problems of the young chemist and chemical engineer and will be given by speakers who have special qualifications for the discussion of their particular subjects. Harold J. Barrett, E. I. du Pont de Nemours & Co., Inc., will outline what industry expects of its new technical employees; this should orient those approaching their first position and enable them to give better service. Byron A. Soule, University of Michigan, who gives one of the few academic courses on use of chemical literature, will sketch how best to tap this storehouse of information. Women majoring in chemistry frequently ask what opportunities exist for them to practice the profession. Lois Woodford, American Cyanamid Co., will discuss this subject on the basis of personal experience. This program alone should make worth-while attendance at the meeting.

Students who contemplate teaching will be interested also in the symposium on Tuesday morning dealing with the Teaching and Practice of Analytical Chemistry. The public meeting on Monday evening (see page 1013) and the general meeting Wednesday afternoon (see page 1013) are outstanding features of the convention that will be of interest to all students.

The breakfast for students, sponsored by the Division of Chemical Education, will be held at the Hotel Lafayette at 7:30 A. M. Wednesday; tickets, $0.50 each. Fraternal, academic, and professional groups will meet for various meals (see page 1016). A number of hotel rooms will be available for students at a reduced rate of $1.45 per day per person. Be sure to use the hotel reservation request form, page 1016, and transmit it immediately.

One of the features of the meetings of the AMERICAN CHEMICAL SOCIETY for students and chemists looking for positions is the Employment Clearing House. Members and paid student affiliates of the SOCIETY registered at the meeting may avail themselves of this opportunity to make contact with employers (see below for further particulars).

The registration fee for regularly matriculated students of chemistry and chemical engineering is $3.00.

Employment Clearing House

Seventeenth Floor, Hotel Statler

At Buffalo the SOCIETY will again provide facilities to bring together employers looking for chemists and chemical engineers and *members and paid student affiliates registered at the meeting* seeking employment and wishing to make such contacts.

Beginning Sunday afternoon, candidates for employment will file records in the Clearing House on forms which provide space for a photograph, personal data, and information regarding education and experience. The records are maintained in classified files and are indexed under all fields of training and experience. This enables an employer to find quickly the records of those with the qualifications desired.

Beginning Monday morning, appointments for interviews will be made at the request of employers and at the times they specify. Private booths will be available for such conferences. No chemist or chemical engineer looking for employment and no employer looking for trained men can afford to miss this opportunity. Many personnel representatives attend each meeting solely to take advantage of the service.

Candidates for Employment

By action of the Board of Directors (December 12, 1940), the Employment Clearing House is open only to members and paid student affiliates of the AMERICAN CHEMICAL SOCIETY registered at the meeting.

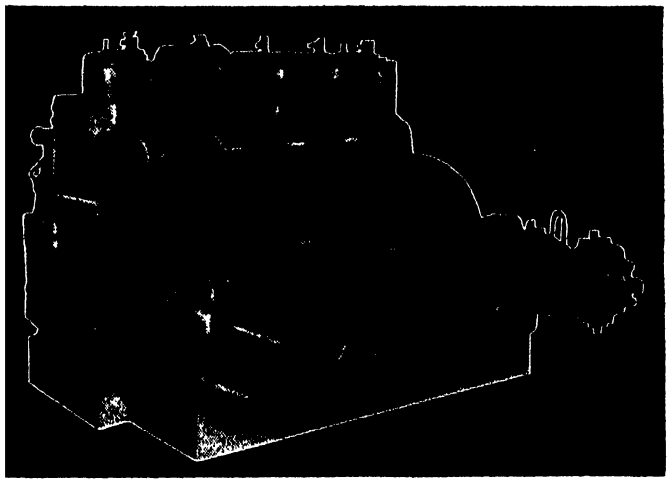
The Clearing House will be open to candidates for employment at 2:00 P. M. Sunday, September 6. Since employers begin inspecting the vitae on Monday, most effective use is made of the records of those who arrive early in the week. At the most recent Clearing House, a larger proportion of interviews and offers of employment were received by those who registered during the first two days. Records filed in advance cannot be inspected by employers until after the arrival of the registrants, since all users are assured that everyone whose vita is on file is available for interview. Those who have not filed vitae by mail may fill out the forms in the Clearing House after arrival.

Amplification of the data on the forms and lists of publications cannot be accepted for filing in the Clearing House. Many employers decline to interview an individual whose photograph is not on his record; therefore, each person should bring with him two copies of a *good* picture (look pleasant; avoid flashlight photographs), not larger than 2.5 × 3 inches, and attach them to duplicate copies of his vita.

A representative of the United States Civil Service Commission will be in the Employment Clearing House to interview any persons interested in government employment. He will furnish information and will authorize appointments to positions at the proper request of government officials, several of whom will be conducting interviews through the facilities of the Clearing House. Under present conditions a large number of women chemists are needed in the government service.

Employers

By action of the Board of Directors (December 6, 1941), the Employment Clearing House is not open to any employer or employer's representative "who, in offers made as a result of interviews in the Clearing House, is unwilling to meet the recommendations unanimously adopted at the Atlantic City meeting of the AMERICAN CHEMICAL SOCIETY in its resolution on employer-employee relationships". (See NEWS EDITION, December 25, 1941, page 1442.)



Although employment of chemists and chemical engineers is at

CLARK ENGINE-DRIVEN COMPRESSOR AND DIESEL ENGINES FOR CHEMICAL SERVICE

CLARK Steam-Driven "Angle" Compressor, 3,000 H.P. Size

CLARK Gas-Diesel Driven "Angle" Compressor, 500 H.P. Size

CLARK Model "F" 4-Cycle Diesel-Gas Engine, 535-600 H.P. Size

NEW CLARK STEAM-DRIVEN "ANGLE" COMPRESSOR

Available in 3, 4, 5, 6 and 8 cylinder models with a range of from 500 to 4000 H.P., the new CLARK Steam-Driven "Angle" Compressor is proving an ideal unit for chemical plants requiring an efficient compressor with built-in steam drive.

Outstanding features are compactness, low installation cost, economical steam rates, flexibility and minimum maintenance and replacement costs.

The unit is equipped with either Unaflow or Counterflow steam cylinders made of a high-grade semi-steel mixture. The cylinders are completely water jacketed, and have large, smooth gas passages to and from the valves. The valves are Clark ring type with low lift and large area.

Ample safety factors have been provided for all sections of the compressor cylinders, which are designed with clearance openings for the addition of extra clearance space when operating requirements make it advisable.

CLARK SUPER-2-CYCLE CONVERTIBLE GAS-DIESEL DRIVEN "ANGLE" COMPRESSOR

This complete, compact, engine-driven compressor unit was specifically designed to reduce initial installation costs and to keep relocation expense at a minimum.

Every part that requires inspection or adjustment is readily accessible.

Its range, used as a Diesel, is 175 to 700 H.P.; as a gas engine, 200 to 1000 H.P.

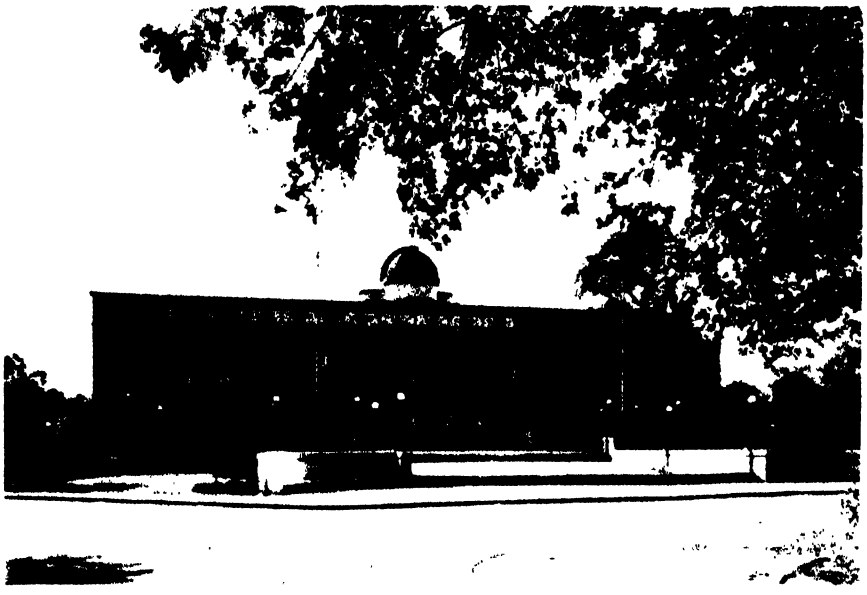
Power cylinders are arranged in a single vertical row and compressor cylinders in a single horizontal row with both connected to the same crankshaft.

Special features include the Clark Super-2-Cycle fuel injection which combines 2-cycle simplicity with fuel economy equal to, or better than, the best 4-cycle engines — Clark-designed oil-cooled pistons, and full force-feed lubrication.

CLARK MODEL F CONVERTIBLE 4-CYCLE DIESEL GAS ENGINE

Built in 3, 4, 6 and 8 cylinder sizes, this unit is an exceptionally clean design with all parts enclosed in oil-tight covers. Fuel pump and fuel lines are isolated to prevent contamination of the lube oil.

Special features are the "Cetane Selector" which permits adjustment of timing on the pumps while the engine is in operation, Clark-designed oil-cooled pistons, and full force-feed lubrication to all bearings and valve gearing, including overhead tappets and rocker-arm bearings. Complete mixing of air and fuel is assured by special Clark inlet valves and piston crown.



Used as a Diesel, the range is from 150 to 535 H.P. and as a gas engine from 150 to 600 H.P.

CLARK BROS. CO., INC., Olean, New York

Export Offices: 30 Rockefeller Plaza, New York. Domestic Sales Offices and Warehouses: Tulsa, Okla.; Houston, Texas; Chicago, Ill. (122 S. Michigan Ave.); Boston, Mass. (131 Clarendon St.); Huntington Park, Calif. (5715 Bicket St.). Foreign Offices: 72 Turnmill St., E. C. 1, London; Avda Roque Saenz Pena 832, Buenos Aires.

Affiliated Companies: Dresser Manufacturing Co., Bradford, Pa.; Pacific Pump Works, Huntington Park, Calif.; Bryant Heater Co., Cleveland, Ohio.

CLARK

Buffalo Museum of Science

a high level owing to the demands of rapidly expanding industry, it is expected that employers will find in the Buffalo Clearing House registrants whose availability might not otherwise be known. They will be chiefly of two types: Summer graduates under the "speed-up program" from small colleges not scouted by industry and those individuals seeking a change of employment, especially chemists and chemical engineers in nonessential industries wishing to make new connections in order to contribute directly to the war effort. Many employers expected a small Clearing House registration at the past two meetings. Actually 421 were available for interview in Memphis, 324 in Atlantic City, and 527 in St. Louis. At each of these meetings more than 1,000 interviews were arranged, 1,721 in Memphis.

Employers who have never visited an A. C. S. Employment Clearing House will find this unique employment aid of distinct value. Many personnel department representatives attend each meeting solely to take advantage of this service. The number of employers regularly using the A. C. S. Employment Clearing House at national meetings of the SOCIETY indicates that the activity is meeting a real need.

The forms filed by candidates for employment provide space for a photograph, personal data, and information regarding education and experience. A classified index will be maintained so that one can find quickly those with the special training or experience desired. A private room will be available in which employers' representatives may inspect the index and vitae at any time from Monday through Friday. At the request of the employer, interviews will be arranged promptly with any whose records are on file. The space available in Buffalo will permit erection of 47 private interview booths.

We know of no other place at which one can find not only the records of such a diversified group of chemists and chemical engineers, but the individuals themselves. Any employer, having a vacancy to fill or anticipating one, can ill afford to pass up this opportunity to make personal contacts.

The advantages to employers are many. They may inspect these records without any of the registrants knowing they are looking for chemists. Personal interviews are always more satisfactory than correspondence; this plan makes available to each employer individuals from widely scattered localities who otherwise could be interviewed only through time-consuming and costly travel.

Plan to use the A. C. S. Employment Clearing House on the Seventeenth floor, Hotel Statler, Buffalo, September 7 to 11, 1942.

Society Regulations Governing Registration

BYLAW 2. (*a*) Attendance at meetings of the SOCIETY is limited to registered persons.

(*b*) All persons in registering at meetings of the SOCIETY shall state whether or not they are members of the SOCIETY and, if not, whether they are chemists or chemical engineers.

(*c*) American chemists or chemical engineers, nonmembers of the SOCIETY, attending meetings of the SOCIETY, shall assist in the support of the facilities which they enjoy by paying a higher registration fee than members. This differential at general meetings shall be $5.00 higher than the fee charged members; while at regional and divisional meetings it shall be at least twice the regular fee adopted. They shall be furnished with a special nonmember badge to differentiate them from members of the SOCIETY and from foreign and nonchemist guests. The differential charged shall not apply to regularly matriculated students majoring in chemistry or chemical engineering at any college or university.

(*d*) Meetings are normally open to all registrants, but any session may be closed to nonmembers of the SOCIETY by order of the President.

NOTE. Corporation members have the right to designate *one representative only* with membership privileges at each meeting. If a *corporation member* sends a substitute for the delegate of record, the Secretary's office should be informed by mail. In registering, such a representative should sign the corporation name, per his own as representative.

Associate members of local sections and of divisions are not members of the Society and have no Society privileges. All nonchemist visitors, including children, regardless of age, who participate in any trips, lunches, or other activities provided on either the men's or ladies' program, regardless of whether they are free or paid events, must pay the visitors' registration fee, $3.00, and wear the appropriate badge.

Society Regulations Governing Papers

BYLAW 3. (*a*) Papers by American chemists or chemical engineers not members of the SOCIETY shall not appear on the programs of general, divisional, or regional meetings of the SOCIETY unless they be joint papers with SOCIETY members.

(*b*) All papers presented before general, divisional, regional, group, local section, or other meetings are the property of the SOCIETY, to be published in the journals of the SOCIETY or released by the appropriate editor if not retained for such publication.

> NOTE. The editors will give prompt decisions when papers are sent to them with request for release. The editors concerned are A. B. Lamb, H. E. Howe, S. C. Lind, N. W. Rakestraw, and W. Albert Noyes, Jr.

(*c*) The SOCIETY is not responsible for statements and opinions advanced by individuals in papers or discussions before its meetings.

(*d*) Any paper, although announced in the final program, may be excluded at any time prior to delivery by order of the President.

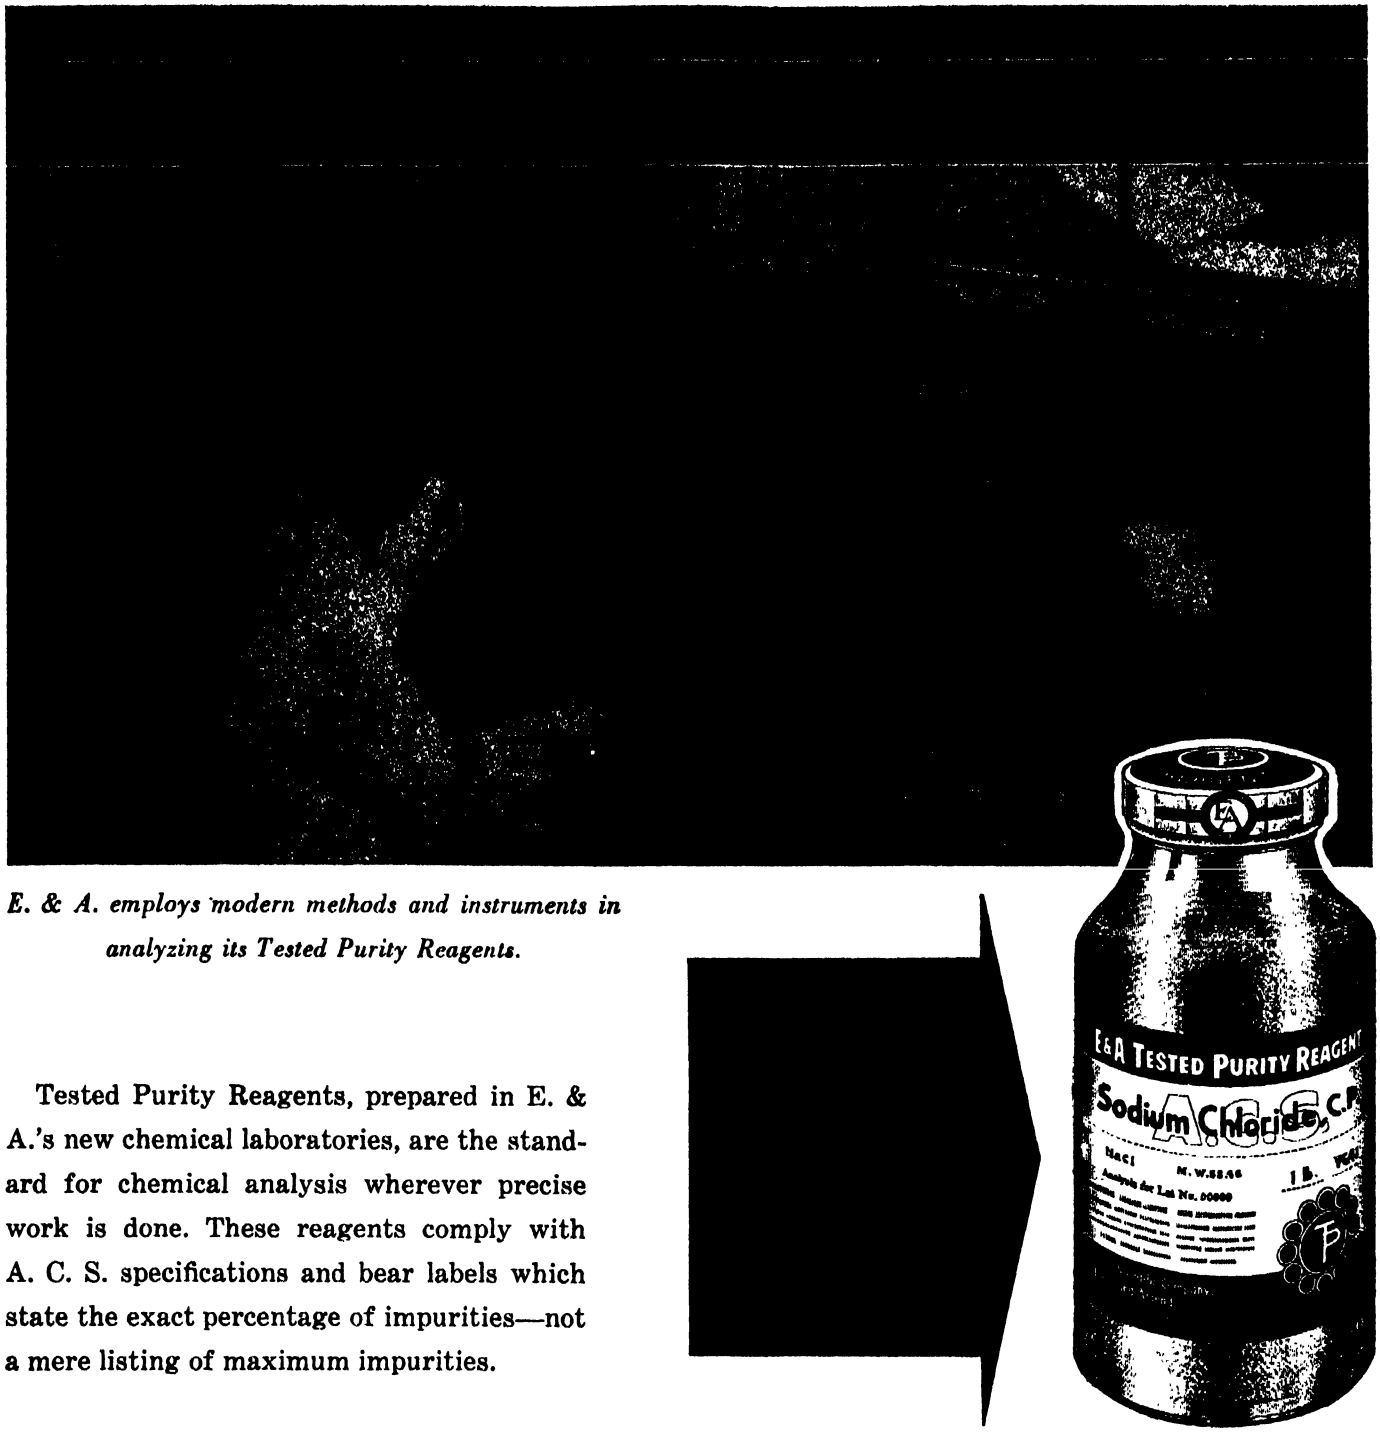
The Board of Directors has voted the following regulations (R-55) governing papers to be presented before general, divisional, regional, or group meetings, supplementing Bylaw 3:

(*a*) Authorship of papers shall be accredited only to individuals and not to companies or laboratories.

(*b*) No paper may be presented which has been offered for publication elsewhere.

(*c*) No paper, no matter how important, may be presented, the title of which does not appear on the final program.

(*d*) If a paper is declined by any division of the SOCIETY, the secretary of that division is instructed to notify the secretary of any other division to which it is likely to be offered.



Travel Information

Buffalo is very accessible. It is served by good motor roads, by several railroad and bus lines, by two major airlines, and by passenger boats on the Great Lakes. Service by public conveyances is frequent. A change in the usual method of travel, such as a trip by boat, may add to the visitor's pleasure. Those who find it possible to drive, may be interested to know that Canada has a moderate gas allowance for visitors. Gasoline will be rationed in Buffalo before the time of the meeting.

Public transportation services are burdened by a tremendous increase in traffic and a decrease in facilities available to civilians. It is essential that those planning to attend the meeting *make reservations early* and buy tickets well in advance of departure. Otherwise, it may be impossible to secure travel accommodations. If tickets are not used, refund will be made by the railroad.

Local trains and busses to all points of the Niagara Frontier are readily accessible from the official hotels.

CONTINUED ON PAGE 1026

E. & A. employs modern methods and instruments in analyzing its Tested Purity Reagents.

Tested Purity Reagents, prepared in E. & A.'s new chemical laboratories, are the standard for chemical analysis wherever precise work is done. These reagents comply with A. C. S. specifications and bear labels which state the exact percentage of impurities—not a mere listing of maximum impurities.

In addition to the everyday needs of the laboratory for analytical reagents, standard solutions and biological preparations, Eimer and Amend is prepared to meet the need for special reagents, rare chemicals, unusual solutions and other hard-to-obtain materials.

These facilities and large stocks are at the command of every laboratory.

Ladies' Program

The hostesses of the Western New York Section invite their guests to choose as much or as little of the entertainment as they wish. Since many of the trips involve some walking, visitors should come prepared for foot comfort. In addition to events on the Ladies' Program, all parts of the General Program are open to ladies who wish to participate.

Ladies' headquarters, Ballroom Foyer, Main Floor, Hotel Statler, will be open from 2:00 to 5:00 P. M. Sunday and from 9:00 A. M. to 6:00 P. M. Monday through Friday. The attendant and hostesses in the headquarters will be happy to assist with plans for special trips, make shopping suggestions, and dispense information.

Tickets for all events must be obtained at the registration headquarters on the mezzanine floor of the Hotel Statler before the deadlines indicated in the program. All trips, except the one leaving Thursday at 3:00 P. M., start from and return to the Delaware Avenue entrance of the Hotel Statler.

In order to afford ladies accompanied by children more opportunity to participate in meeting activities, a nursery school will be maintained in the Hotel Statler. It will be under the direction of Mrs. Mary B. Parke, director of the Nursery School at the University of Buffalo.

Sunday, September 6

2:00 to 9:00 P. M.—Registration, Palm Court, Hotel Statler.

2:00 to 5:00 P. M.—Ladies' headquarters will be open to welcome visitors.

4:00 to 10:00 P. M.—Social gathering, Terrace Room, Hotel Statler; movies at 4:00 and 8:00 P. M.

Monday, September 7

8:00 A. M. to 6:00 P. M.—Registration.

3:00 to 5:00 P. M.—Tea and reception in honor of the wives of the officers of the AMERICAN CHEMICAL SOCIETY, Ballroom, Hotel Statler. Admission by badge.

8:30 P. M.—Public meeting, Kleinhans Music Hall (see General Program, page 1013). Admission by ticket (no charge) which must be obtained before 6:00 P. M. Monday.

Tuesday, September 8

10:00 A. M. to 4:00 P. M.—Trip to the Albright Art Gallery; luncheon at the Buffalo Museum of Science followed by a tour of the museum. Tickets, including transportation and luncheon, $1.35 each, must be obtained before 4:00 P. M. Monday.

10:00 A. M. to 1:00 P. M.—Visit to the Albright Art Gallery. Transportation tickets, $0.50 each, available until 9:00 A. M. Tuesday.

10:30 A. M. to 4:00 P. M.—Trip to the Buffalo Historical Society; luncheon at the Buffalo Museum of Science followed by a tour of the museum. Tickets, including transportation and luncheon, $1.35 each, must be obtained before 4:00 P. M. Monday.

10:30 A. M. to 1:00 P. M.—Trip to the Buffalo Historical Society. Transportation tickets, $0.50 each, must be secured before 9:00 A. M. Tuesday.

8:00 P. M.—County Fair, Memorial Auditorium (see page 1020). Admission by ticket (no charge) which must be obtained before 6:00 P. M. Tuesday.

Wednesday, September 9

10:00 A. M. to 4:00 P. M.—Inspection trip to Niagara Falls. For description of trip, available side trips, costs, and regulations for Canadian travel, see pages 1018 and 1020. Tickets for transportation and luncheon, $3.00 each, and for special side trips, must be secured before 5:00 P. M. Tuesday.

10:00 A. M. to 12:15 P. M.—Visit to the Lockwood Memorial Library on the University of Buffalo Campus. Rare first editions, including the Folio edition of Shakespeare, will be on display. Charles Abbott, the librarian, will address the visitors at 11:00 A. M. A bus will leave the corner of Main and Genesee Streets at 10:15 A. M. Transportation tickets, 15 cents each, must be obtained before 9:00 A. M. Wednesday.

1:00 P. M.—Luncheon at the Twentieth Century Club, followed by a talk and display of rare antique jewelry by Mrs. Sabine Brumberg. The beautiful Delaware Avenue shops offer an opportunity to enjoy window-shopping en route from the Hotel Statler to the Club (0.9 mile). Those planning to walk should leave the Hotel Statler not later than 12:15 P. M. Transportation will be provided, leaving at 12:45 P. M. Tickets, $1.75 each, must be obtained before 12:00 M. Tuesday. Limit, 150.

4:00 to 10:00 P. M.—Inspection trip to Niagara Falls. For description of trip, available side trips, costs, and regulations for Canadian travel, see pages 1018 and 1020. Tickets for transportation and dinner, $3.25 each, and for special side trips, must be secured before 5:00 P. M. Tuesday.

7:30 P. M.—Subscription dinner (dress, optional), Ballroom, Hotel Statler. Tickets, $3.50 each, available until 12:00 M. Wednesday. Limit, 800. (See page 1022.)

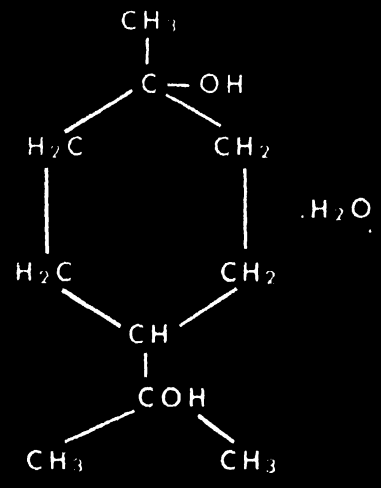
10:00 P. M.—Dance, Ballroom, Hotel Statler. Admission by badge.

Thursday, September 10

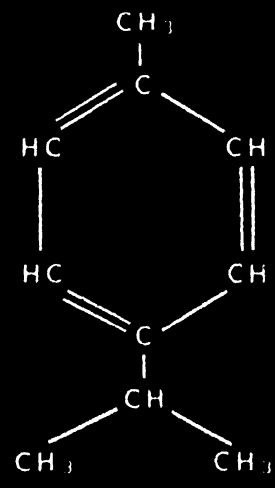
10:00 A. M. to 4:00 P. M.—Inspection trip to Niagara Falls. For description of trip, available side trips, costs, and regulations for Canadian travel, see pages 1018 and 1020. Tickets for transportation and luncheon, $3.00 each, and for special side trips, must be secured before 5:00 P. M. Wednesday.

3:00 to 10:00 P. M.—Inspection trip to Niagara Falls. For description of trip, available side trips, costs, and regulations for Canadian travel, see pages 1018 and 1020. Tickets for transportation and picnic supper, $2.00 each, and for special side trips, must be secured before 5:00 P. M. Wednesday.

4:00 to 10:00 P. M.—Inspection trip to Niagara Falls. For description of trip, available side trips, costs, and regulations for Canadian travel, see pages 1018 and 1020. Tickets for transportation and picnic supper, $3.00 each, and for special side trips, must be secured before 5:00 P. M. Wednesday.



Friday, September 11



10:00 A. M. to 4:00 P. M.—Inspection trip to Niagara Falls. For description of trip, available side trips, costs, and regulations for Canadian travel, see pages 1018 and 1020. Tickets

Two Interesting Terpene Derivatives

Terpene chemicals and derivatives are structurally midway between the aliphatic and aromatic hydrocarbon derivatives. They may, therefore, present many interesting combinations of properties compromised between these groups, and in addition provide specific powers of penetration and wetting. Two of these derivatives, now available in quantity may suggest further exploration to you.

We will be glad to exchange ideas should the fact that these products are now available in quantity be of interest to you.

Albright Art Gallery

Buffalo was the third city in the country to establish a permanent art gallery. Only Boston and Philadelphia had taken such action when 26 prominent citizens in 1862 incorporated the Buffalo Fine Arts Academy. First situated in rooms downtown, the academy after several changes in location obtained its present building in 1905 through the gift of John J. Albright. The building, of Maryland marble and designed in neoclassic style by the eminent American architect, Edward B. Green, is one of the most beautiful of its type in this country. Situated in Delaware Park overlooking the lake, the gallery's main beauty lies in its large and well-proportioned sculpture court, in which the warm, natural light given by the skylighted roof, together with the fresh air and view of the lake obtained through the large doors, suggests the atmosphere of the sculpture courts of classic times. Dominating the sculpture court is a Chinese Chimera used in the 6th Century to guard the ancestral burial grounds, while close at hand is a life-sized statue of a Roman poet carved in the 2nd century B. C., thought to be one of the few surviving sculptures of that period. Among the works of contemporary sculptors is the seated figure of "Night" by Aristide Maillol, which was purchased from the artist on the eve of the present war. The gallery is well known for its modern paintings, from the brushes of the great artists of the late 19th century in France to leading living artists. Well known is the portrait study of "Elinor, Jean and Anna" by George Bellows, which has toured the country in one exhibition after another. Whatever the special art interest of the visitor, it is believed that the Albright Art Gallery will be a worth-while experience.

The Buffalo Museum of Science

Have you ever wished for a bird's-eye view of the world you live in with each part of the vast design correlated with the others? To meet your needs and that of others whose busy lives leave little time to construct the pattern of the universe for themselves, the Buffalo Museum of Science has achieved a clear and understandable story, all in three-dimensional natural color. Here trained minds and skillful hands have set forth, largely in miniature habitat groups which create the illusion of reality, the connected story of the building stones of the universe, the stars and planets in the interstellar spaces, the earth itself, the creatures that people the earth, the waters under the earth, and the heavens above it. Here are illustrated the fundamental laws of living—evolution, heredity, environment—as applied to men as well as to lower forms of living things. Here, he who walks can read the wonders that comprise man's body, how he learned the lessons that enabled him to produce the glorious civilizations of the past, and how he learned to use his hands and mind to fill his everyday needs.

The Buffalo Historical Society

The Museum of the Buffalo Historical Society tells the story of the Niagara Frontier in a scientific arrangement of objects so as to present a cultural history of the region from its first occupation to the present time. The Hall of the Woodlands relates, in artifacts arranged in chronological order, the history of the Indian cultures of New York State from the coming of the nomad Algonqian tribes to the disintegration of the great Iroquoian culture. Here, also, is shown the habitat, dress, and customs of the Indians of the woodland regions. The coming of the French, old Fort Niagara, and the occupation of the Frontier by the followers of the Bourbons next attract the attention of the visitor. The Lilies of France and the Cross of St. George pass into history and the Stars and Stripes float over the Niagara region. The surveying instruments of Ellicott place the village of Buffalo on the map, and the infant Queen of the Lakes is born. The Lake Marine Room tells in models, figureheads, and marine mementos the romance of the lakes. Complete installations reproduce the kitchen of an early pioneer of Buffalo, fully equipped with all the necessary furnishings that the good wife could have desired. A spinning room contains the old loom for weaving, the wool wheel, flax wheel, quilling wheel, and clock reel—full equipment for manufacturing yarn for knitting or weaving homespun. Most colorful of all is the blacksmith shop, with its old forge and handmade tools, of David Reese, pioneer smith of Buffalo. Near by stands a reproduction of an old cobbler's shop of Buffalo, dating about 1845, and adjacent to this, an early apothecary shop. The Hall of Transportation and Industry recalls the industrial history of the city and traces the transportation from the stagecoach to the modern airplane. Services of the men who fought that democracy might endure are retold in the Hall of Wars. Here the uniforms and equipment are displayed and the military story of the frontier revealed. A more peaceful scene is found in the Ceramics Room where Anglo-American Staffordshire and American glass and pottery are displayed. Here will be found also a wonderful collection of pewter. From this room it is but a step to Costume Hall where the changing fashions of the frontier are displayed, and the interesting gowns of bygone days are preserved. It is impossible to enumerate all of the various features—coins, stamps, comparative exhibits—but a visit to the museum will convince the most skeptical that "other Council Fires were here before ours".

Lockwood Memorial Library

The Lockwood Memorial Library on the University of Buffalo Campus, was opened in 1935, a gift from Thomas B. Lockwood and his wife, Marian Birge Lockwood. The library has three special collections of which it is justly proud: the Lockwood Collection which consists of first editions of books in English literature from the earliest time to the present; the Collection of Fine Printing, which contains beautiful books representative of the finest type of printing and examples of the best work from several private presses; and the Modern Poetry Collection, which contains 11,000 volumes of first editions of modern poets and a growing collection of manuscripts and autographed letters contributed by a number of representative modern poets. A tour, guided by members of the staff, will include visits to the principal points of interest. The visitor will also have an opportunity to see the University of Buffalo Campus.

The Twentieth Century Club

Women guests of the AMERICAN CHEMICAL SOCIETY will have the unusual privilege of lunching in the exquisite oval dining room of the Twentieth Century Club. The committee feels especially pleased to offer this luncheon since the private rooms of the club are rarely opened to the public. The Twentieth Century Club, a women's club, has played a leading part in the cultural life of Buffalo since its founding in 1894. The clubhouse, of Italian Renaissance architecture, is so beautifully detailed that it is difficult to select points of especial interest. Worthy of particular note is the mural representing the seven ages of women. This mural, located in the room bearing her name, was done by Mrs. John C. Glenny, one of the early members of the club.

After the luncheon, Mrs. Sabine Brumberg will lecture on and show a part of her 1,600-piece collection of antique jewelry. This collection, started by her father, contains a 2,000-year-old set of Roman slave rings, a cameo picture of one of Marie Antoinette's children, framed in rose diamonds, black opals and emeralds the size of robin's eggs, East Indian turquoise and pearl necklaces, and many other pieces of beauty and historical interest.

Division of Agricultural and Food Chemistry

ELLERY H. HARVEY, *Chairman*; ROGER H. LUECK, *Secretary*
O. I. STRUVE, *Local Assistant*

Monday Afternoon

Fillmore Room, Hotel Statler

SYMPOSIUM ON METHODS FOR THE PRESERVATION OF FOODSTUFFS AND THEIR APPLICATION IN THE WAR EFFORT

E. H. HARVEY, *Presiding*

2:00— 1. H. R. KRAYBILL. The Dehydration of Meat.

2:25— 2. W. V. CRUESS. The Dehydration of Fruits and Vegetables.

2:55— 3. E. J. CAMERON. Latest Developments in Canning Technology.

3:20— 4. M. E. PENNINGTON. The Conservation of Perishables by Refrigeration—a World Problem.

3:45— 5. DOMENIC DEFELICE. Recent Developments in Freezing Foods.

4:10— 6. HERMANN C. LYTHGOE. The Cold Storage of Food in The United States—a Comparison between Today's Holdings and Those of Twenty Years Ago.

Symposium continued Wednesday morning.

Tuesday Morning and Afternoon

Chinese Room, Hotel Statler

VITAMINS AND NUTRITION

Joint program with the Division of Biological Chemistry (see page 1032).

CONTINUED ON PAGE 1030

ANHYDROUS HYDROFLUORIC ACID

BORON TRIFLUORIDE

ANHYDROUS HYDROGEN CHLORIDE

Three gases used extensively in modern organic synthesis.

METALLIC SALTS & OXIDES

Many types and grades to meet war-time industrial production requirements.

METAL ORGANIC CHEMICALS

Widely used in protective coating industries—as driers, water proofers, catalysts, lubricants, fungicides and for many other specific applications.

"STANREDUCE"

A material developed to meet war-time need for a short method of tin analysis in cast iron and plain steel.

SYNTHETIC OPTICAL CRYSTALS

Large single crystals of sodium chloride, lithium fluoride, potassium bromide and sodium nitrate for physical testing and research in ultraviolet and infrared—especially in organic synthesis.

LABORATORY CHEMICALS AND APPARATUS

A complete line of technical, special reagent and C.P. chemicals—a supply base for war-work in the laboratories of the country.

SYMPOSIUM ON METHODS FOR THE PRESERVATION OF FOODSTUFFS AND THEIR APPLICATION IN THE WAR EFFORT (*Continued*)

E. H. HARVEY, *Presiding*

9:00 7. H. S. MITCHELL AND H. C. BLACK. Stabilization of Fats and Fatty Foods.

9:25— 8. PAUL E. HOWE. Nutritional Aspects of Processing Foods.

10:00 9. VIRGIL O. WODICKA. Food Requirements for Overseas Use.

10:20 —10. ROBERT R. MELSON. Food Packaging for Overseas Use.

10:45 —11. SIDNEY H. KATZ. Protection of Foodstuffs against War Gases.

11:10 —12. A. H. WARTH. Packaging Trends during the Present Emergency.

11:35—13. W. H. CATHCART. Enrichment of Flour and Bakery Products with Reference to Their Use by the Armed Forces.

12:15 — Divisional luncheon in honor of **Lucius M. Tolman,** former chairman of the division, followed by business meeting, Kathryn Lawrence Dining Room, North Street and Delaware Avenue, $1.10.

Thursday Morning

Fillmore Room, Hotel Statler

SYMPOSIUM ON METHODS FOR THE PRESERVATION OF FOODS—THEIR WARTIME ASPECTS

R. H. LUECK, *Presiding*

9:00 —14. J. S. BLAIR AND T. B. AYRES. The Protection of Natural Green Pigment in the Canning of Peas.

9:25—15. E. L. MOORE, W. B. ESSELEN, JR., AND C. R. FELLERS. Factors Responsible for the Darkening of Packaged Orange Juice.

9:45—16. DONALD K. TRESSLER, CARL S. PEDERSON, AND HAROLD G. BEATTIE. Recent Advances in Fruit and Vegetable Juice Preparation and Preservation.

10:10—17. C. O. BALL. Principles Involved in Short-Time Pasteurization of Milk.

10:35—18. J. P. KASS AND L. S. PALMER. The Aldose-Protein Condensation in the Browning of Autoclaved Milk. Comparative Electrometric Formol Protein Titrations of Raw and Autoclaved Artificial, Skim, and Dialyzed Milks.

11:00—19. M. E. PARKER. The Role of Acid Detergents in Food Sanitation.

11:25 —20. HERMANN C. LYTHGOE AND ALICE S. ROSENTHAL. A Comparison between the Lipase Content of Goat's Milk and Cow's Milk.

Thursday Afternoon

Fillmore Room, Hotel Statler

GENERAL PAPERS

B. E. PROCTOR, *Presiding*

2:00—21. A. E. PERKINS. Dry Matter Determinations on Green Plant Material and on Silage.

2:20—22. CHARLES A. BRAUTLECHT AND A. STANLEY GETCHELL. The Chemical Composition of White Potatoes.

2:45—23. CHARLES A. BRAUTLECHT AND STANLEY P. FREEDMAN. Ash of White Potato Starch.

3:10—24. Z. I. KERTESZ. Report of Committee on Pectin Nomenclature.

3:40 —25. W. H. STARK, PAUL KOLACHOV, AND H. F. WILLKIE. Wheat as a Raw Material for Alcohol Production.

4:05—26. LYLE D. GOODHUE. Insecticidal Aerosols Produced by Spraying Solutions in Liquefied Gases.

4:30—27. H. L. CUPPLES. Colored Impurities in Commercial Phenothiazine.

Division of Analytical and Micro Chemistry

GEORGE L. ROYER, *Chairman;* FRANCIS W. POWER, S.J., *Secretary*
ALLAN A. WAHL, *Local Assistant*

Monday Afternoon

Parlors D and E, Hotel Statler

MICRO CHEMISTRY

GEORGE L. ROYER, *Presiding*

2:00— 1. CARL TIEDCKE. A Fractional Distillation Microapparatus.

2:15 — 2. E. F. WILLIAMS AND CHARLES MARESH. Microscopical Investigation of Sulfanilamide, Sulfaguanidine, and Several of the Acetyl Derivatives of These Drugs.

2:35— 3. A. R. PRAY AND E. A. ARNOLD. A Colorimetric Method for the Determination of Sodium.

2:55 — 4. LEO K. YANOWSKI AND WALTER A. HYNES. Comparison of Reaction Products Formed Microscopically by a Few Complex Cobaltammines with Various Anions.

3:10— 5. M. L. MOSS WITH M. G. MELLON. Colorimetric Determination of Cobalt with Terpyridyl.

3:30— 6. JACOB CHOLAK, DONALD M. HUBBARD, AND ROBERT V. STORY. The Determination of Aluminum in Biological Material.

3:50— 7. CHARLES E. WHITE AND M. H. NEUSTADT. A New Fluorescent Qualitative Test for Zinc.

4:05— 8. LEO K. YANOWSKI. Activities of the Metropolitan Microchemical Society.

4:20— 9. CLEMENT J. RODDEN. Report of the Divisional Committee on Microbalances. The Reproducibility of Weighings Made on Microbalances.

Tuesday Morning

Townsend Hall, University of Buffalo

SYMPOSIUM ON THE TEACHING AND PRACTICE OF ANALYTICAL CHEMISTRY

Joint symposium with the Division of Chemical Education.

GEORGE L. ROYER, *Presiding*

9:00—10. F. E. BROWN. Introductory Remarks.

9:10 —11. JULIUS A. KUCK. The Teaching of Micro Chemistry. Discussion by R. P. CHAPMAN.

10:05 —12. HARVEY DIEHL. The Teaching of Quantitative Analysis. Discussion by D. E. FOWLER.

11:00—13. SAMUEL E. Q. ASHLEY. Teaching of Analytical Chemistry from an Industrial Point of View. Discussion by PHILIP J. ELVING.

12:15— Divisional luncheon, Fillmore Room, Hotel Statler, $1.35.

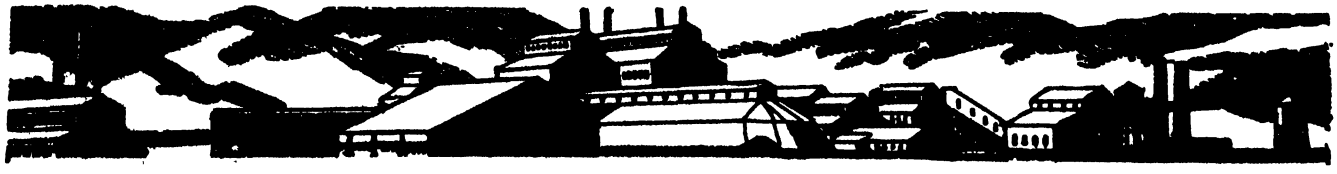
Tuesday Afternoon

Parlors D and E, Hotel Statler

ANALYTICAL CHEMISTRY

HARVEY DIEHL, *Presiding*

2:00 14. I. M. KOLTHOFF AND J. I. WATTERS. The Polarographic Determination of Manganese as Tri-Dihydrogenpyrophosphatomanganiate.



2:20 —15. GRANT WERNIMONT AND F. J. HOPKINSON. The Dead-Stop End Point Method as Applied to the Karl Fischer Method for Determining Moisture.

2:35 16. FRANK M. BIFFEN AND FOSTER DEE SNELL. Improved Methods of Analysis of Commercial Oil Emulsions and Wax Dispersions.

2:55 —17. WILLIAM SEAMAN, A. R. NORTON, AND J. J. HUGONET. The Determination of Water in Aniline by the Cloud Point with Mixed Cottonseed and Mineral Oils.

3:15—18. WILLIAM SEAMAN, A. R. NORTON, AND R. T. FOLEY.

CONTINUED ON PAGE 1032

INDUSTRIAL PRODUCTS BY FERMENTATION PROCESSES

NOAH has received credit for one of the earliest recorded chemical discoveries. He found that under some conditions grape juice underwent a change and the resulting product, when imbibed, produced a pleasant physiological effect entirely different from that which the original juice gave. Unfortunately, as a result of continuing his testing "not wisely but too well", he has received some undesirable notoriety.

It was also observed at an early date that sometimes fruit juices underwent another type of change which resulted in the development of sourness. Milk was also found to become sour on storage. Since the resulting products found practical use, empirical methods of regulating these alterations were developed.

Not until the investigation of Pasteur was it recognized that these changes were due to the growth of various microscopic organisms. It had been noticed earlier, however, that the development of visible organisms, termed molds, also resulted in changes of the medium on which they grew.

Since Pasteur a large number of experimenters have developed methods not only of preventing, but also of encouraging, the growth of these organisms, both visible and microscopic. Others have studied the chemical changes brought about by them. It is now recognized that these reactions are similar to, or in many cases the same as, those occurring during the development of a fruit or vegetable and are natural vegetative processes.

As a result of some of these researches a considerable variety of products of industrial importance is now being manufactured by the careful cultivation of a number of these organisms. Since this is a comparatively new field, it can safely be assumed that with time the number of compounds produced by such methods will be greatly enlarged. The probability of this is increased by the fact that the raw materials for such processes are generally of American agricultural origin, thus removing any dependence on foreign products.

Chas. Pfizer & Co., Inc. has been one of the leaders in this field and is at present producing Citric Acid, Gluconic Acid, Fumaric Acid, and Oxalic Acid by such methods. From these acids a wide variety of derivatives is being manufactured. A well-trained research staff is engaged in the improvement of present processes and in the development of new products. Results in many of these latter investigations indicate that products of possible importance in a variety of fields will in time be made available.

COLUMBIA CHEMICALS

IN AIRCRAFT ENGINES, FOR INSTANCE . . .

Back of the skill and precision on the assembly line is a factor contributing substantially to the excellence of America's aircraft engines. This is the function of Columbia Chemicals in assuring qualities that are vital to the performance and speedy production of aluminum, steel, rubber, fabrics and countless other war materials. But the usefulness of Columbia Chemicals does not depend upon their production alone. Our facilities for getting them on the job where—and when they are needed are of equal importance to all who use these essential materials.

ESSENTIAL INDUSTRIAL CHEMICALS

GLAMOUR BOY
OF THE WEST COAST

Maybe they used to cuss him and throw him back . . . but not any more. Because the soup-fin shark has earned Pacific coast fishermen more money than they've ever seen before. Somebody exposed the fact that his abnormally large liver has the highest Vitamin "A" content of any other in the fish liver oil industry . . . making him a bonanza to the nation . . . as well as a gold mine for the fishermen.

This discovery was aptly timed. The original source of Vitamin "A", namely halibut, is becoming scarce, and the military as well as civilian demand for it is increasing. Our fighting pilots will be outstanding consumers, for Vitamin "A" greatly improves night vision.

We are telling this story because the Sharples Super-Centrifugal Process has proved the fastest and most economical method of recovering fish oil from the liver.

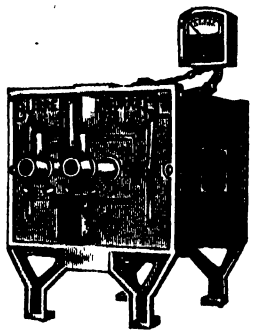
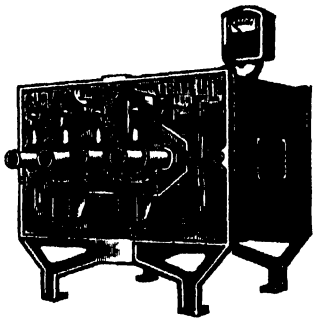
WAR SPECIFICATIONS *Can Be* MET WITH

Temperatures up to 2650°F.

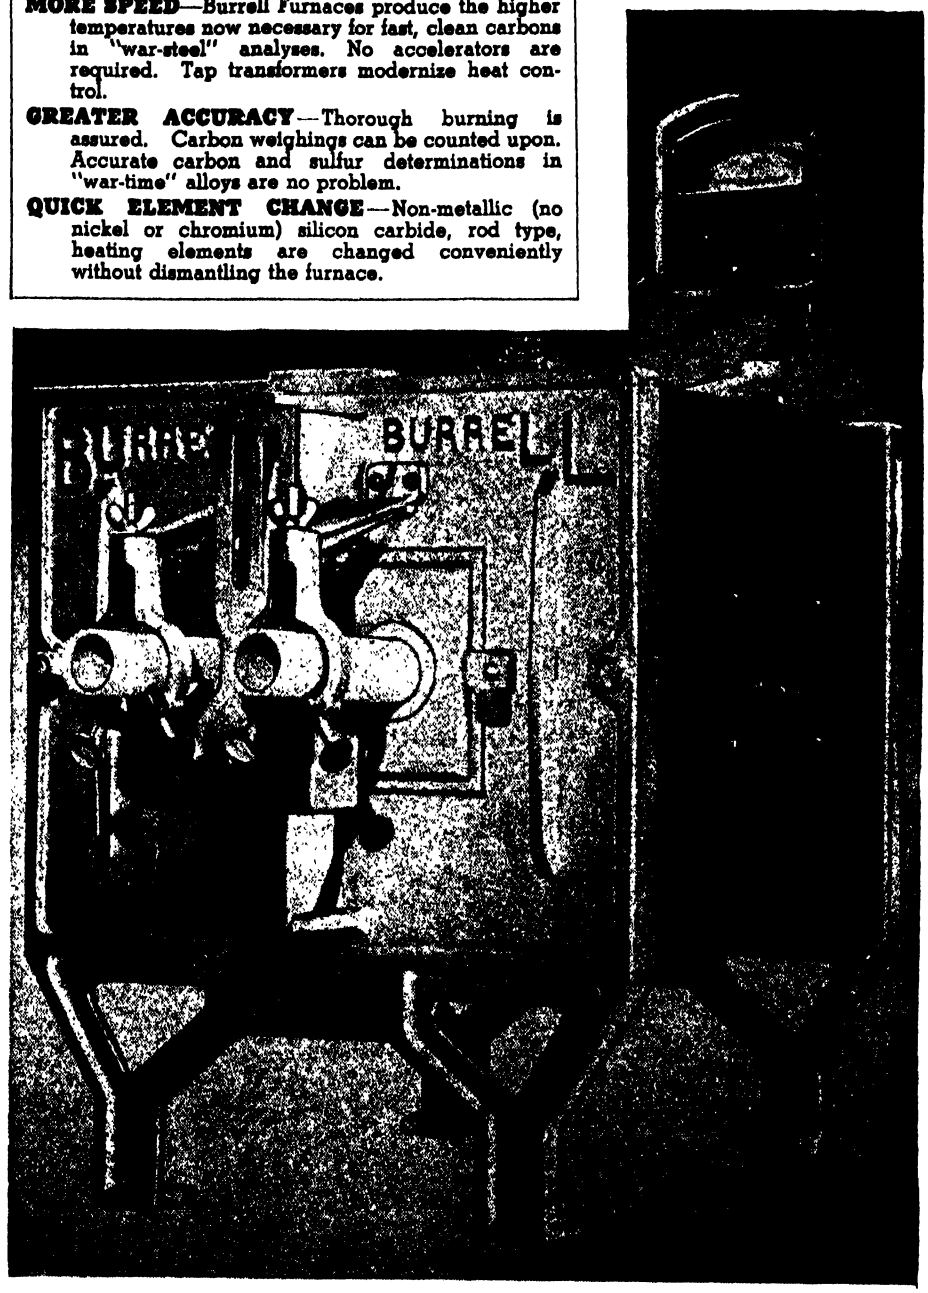


MORE SPEED—Burrell Furnaces produce the higher temperatures now necessary for fast, clean carbons in "war-steel" analyses. No accelerators are required. Tap transformers modernize heat control.

GREATER ACCURACY—Thorough burning is assured. Carbon weighings can be counted upon. Accurate carbon and sulfur determinations in "war-time" alloys are no problem.



QUICK ELEMENT CHANGE—Non-metallic (no nickel or chromium) silicon carbide, rod type, heating elements are changed conveniently without dismantling the furnace.



A24-930 modernizes the iron and steel "lab." for high temperature work.

A24-940 doubles capacity and is the most popular model.

A24-950 with four tubes enables one man to run 125 "carbons" in 8 hours.

The 2-tube "most popular" model doubles capacity, measures 14" x 17" x 22" long, has 9" heating chamber, consumes 1.5 kw at 2500°F., and costs $150 without pyrometer and tap transformer.

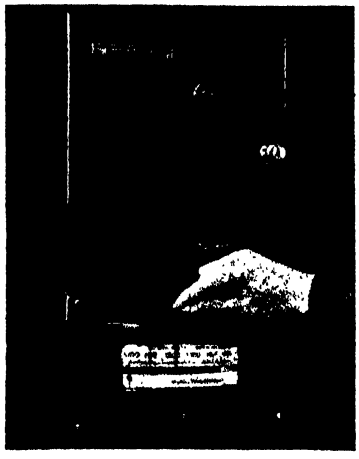
Here's what UNIVERSAL

TEMPERATURE CONTROLLERS

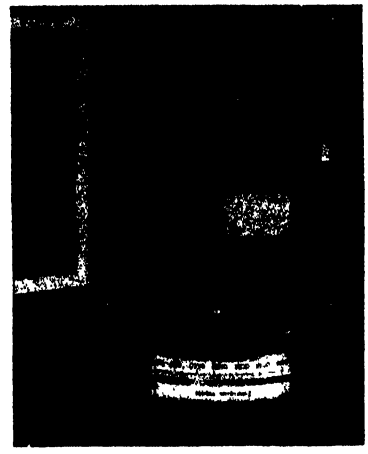


mean to you. Instantaneous control action with the famous "Electronic Principle" control system and extreme accuracy of temperature measurement, plus interchangeability of all component parts, interchangeability of scale ranges, ready accessibility of all parts for individual checking and many other features. Wheelco UNIVERSAL Controllers include Capacitrols, Potentio-trols, Limitrols and Resistance Thermo-trols.

1

UNIVERSAL Temperature Controllers may be either flush mounted, as illustrated, or surface mounted.

Wheelco Instruments Co.
851 W. HARRISON STREET CHICAGO, ILL.

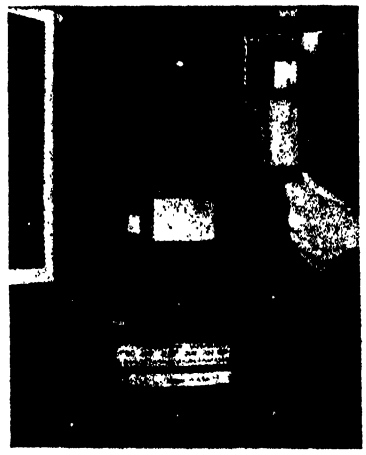


2

Temperature Control Adjustment easily made from front of Controller. Control Setting may be locked inside case if desired.

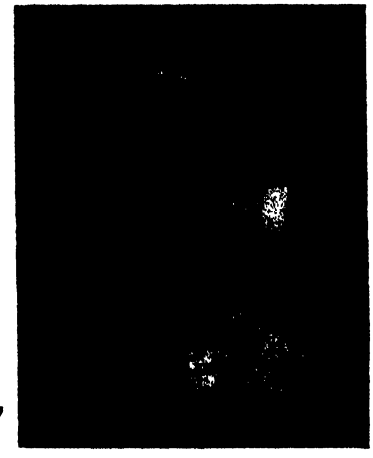
3

Controller Case has push type lock with spring catch as a precaution against sabotage.



4

Open view shows simplicity and compactness of instrument construction. Auxiliary equipment may be incorporated in space at left.

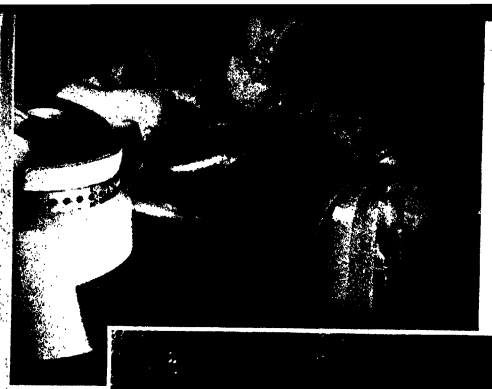


5

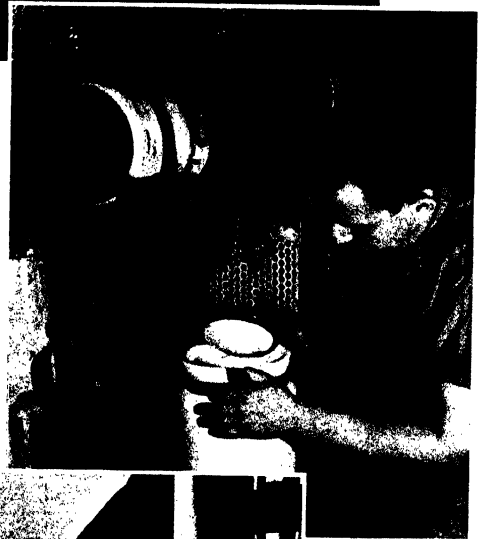
Removing plug-in relay. Relay interchangeability permits conversion of any type UNIVERSAL Controller to Limitrol or back.

6

Plug-in Control Chassis is easily removed for inspection or replacement. Plug sockets may be seen above relay.



7

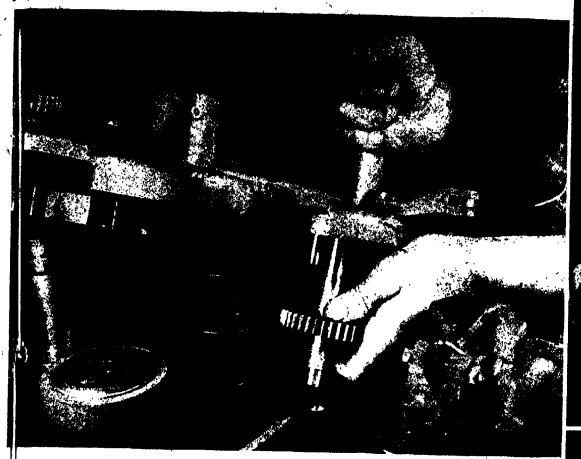


Interchangeable Measuring Sections place choice of scale range or type of millivolt measuring system at disposal of operator.

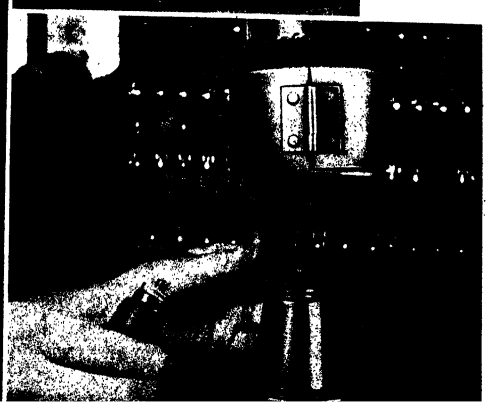
For full details, write for free Bulletin Z6000

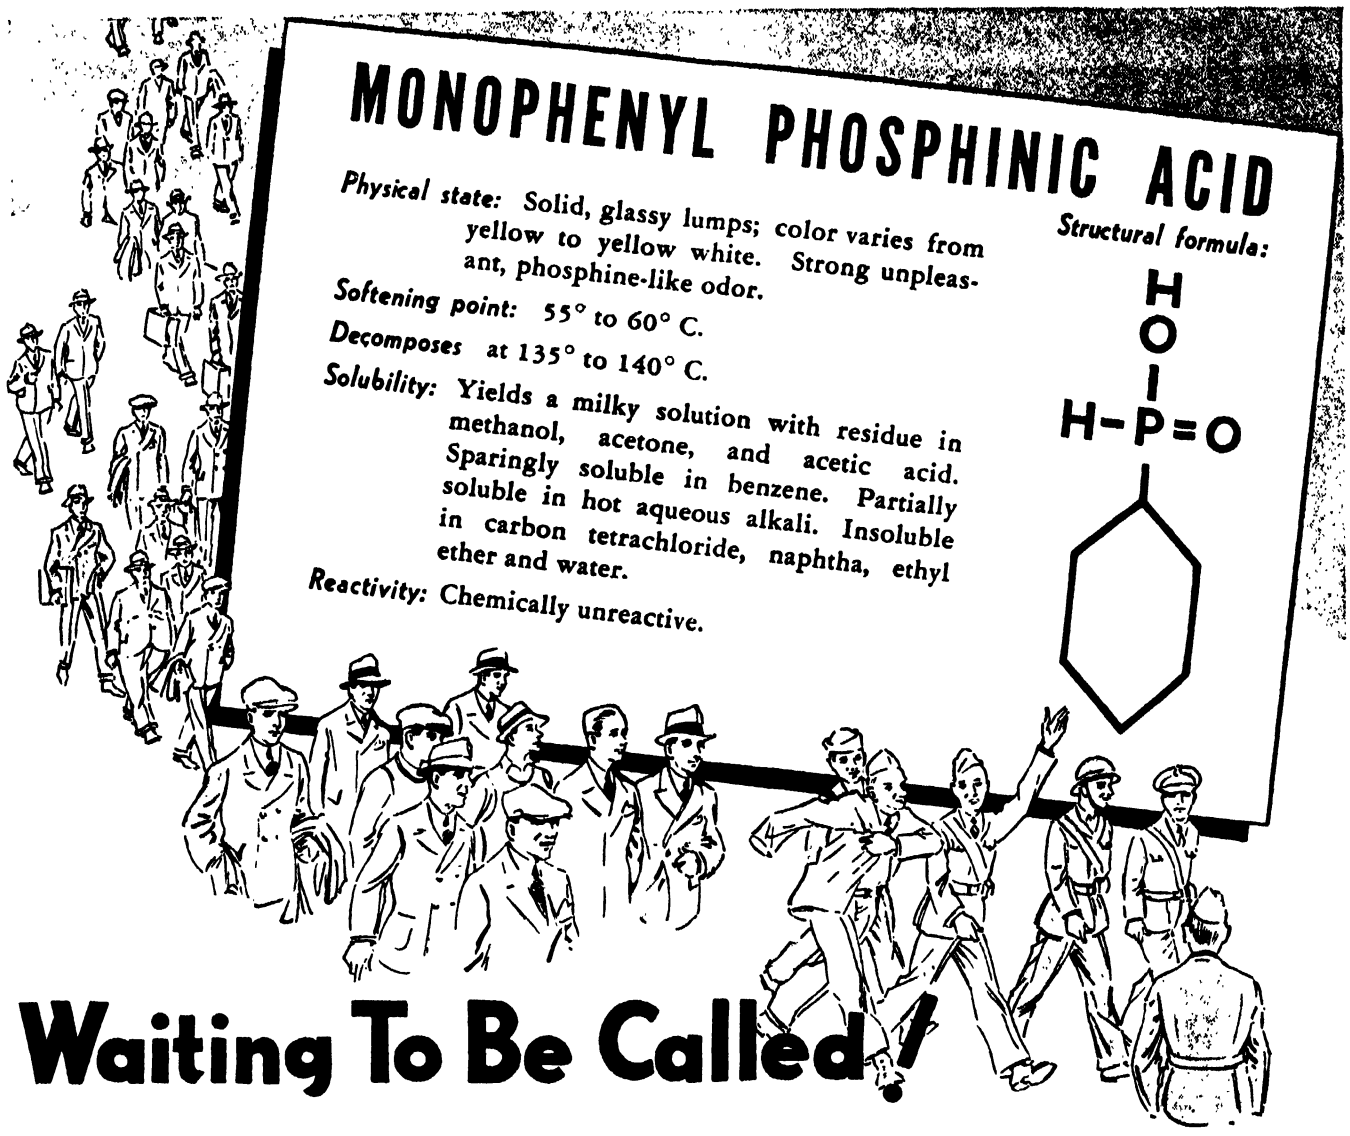
THE CHEMICAL NEWS PARADE

See "Synthetic Resin Replaces Industrial Rubber", page 1003



Upper left corner. Workman at RCA Manufacturing Co. cuts a ball mill gasket from a sheet of Resistoflex. The synthetic compound is far more resistant to chemicals used in the mill than the rubber and synthetic rubber gaskets previously used, besides releasing quantities of these scarcer products for other purposes. *Left.* RCA workman fixes cover on a ball mill jar prior to placing it in the rotating unit. A gasket made of Resistoflex, unaffected by chemicals ground in the mill, is used to seal the jar cover. *Lower left corner.* RCA operator shows how a Resistoflex tube made from roller sheet is used as a suction line on a sandblast machine. The Resistoflex hose has been in service for nearly three months. Previous rubber hoses had to be replaced at least weekly. *Below.* Jaws of forming press for small parts are lined with Resistoflex sheet cemented directly to the metal. Use of the synthetic compound in this one operation has resulted in tremendous savings for RCA. *Right below.* Workman installs a Resistoflex vibration block on wire cutter at RCA. The blocks can be seen at bottom of the picture. The light-colored block was made of a standard compound and had to be drilled to increase resiliency. A new compound (the dark block in the picture) was then formulated to give the exact hardness and elasticity required in this critical operation. *Right center.* A sheet Resistoflex shield protects the operator's wrists in a sandblast machine for cleaning small parts. Resistoflex resistance to abrasion and wear has made the shield far outlast its rubber predecessors. At the same time flexibility in compounding Resistoflex PVA materials has made it possible to formulate a substance which combines maximum protection and durability with the required flexibility.





Above. Another point at which Resistoflex compounds are replacing rubber at RCA in transmission rings which rotate against metal gears to supply power for various operations. *Upper right corner.* Resistoflex hose, which has demonstrated great resistance to flexing and to vibration, is shown in use as gas and air line connectors on an automatic machine. It has a Resistoflex PVA material core and braided cotton outer jacket. *Lower right corner.* A Resistoflex aligning ring replacing rubber in an operation for clinching metal parts on RCA tubes has shown a life of three weeks compared to a few hours for rubber rings formerly used.

Waiting To Be Called!

TODAY . . . millions of young men in all walks of life . . . await the call to the service of their country.

Today . . . in the Victor Research Laboratory . . . scores of phosphorus compounds similarly await the call to service of industry.

Phosphorus unites readily with other elements . . . producing countless unusual compounds such as that briefly described above. For many, no practical use has yet been discovered . . . yet the same was true of others which long since have been "drafted" for important tasks in industry.

Perhaps one of these laboratory compounds may solve an important problem for you. If not . . . tell us your requirements and perhaps we can produce one that will. Our research staff will gladly cooperate with you.

RE-DESIGN

with

REX *Flexible Metal Hose*

Units shown are typical Vari-formed Assemblies

The physical adaptability of REX Flexible Metal Hose simplifies design and assembly problems alike. Almost every consideration of vibration, movement, alignment, saving of space and saving of weight in fluid handling problems points to one or another of the many production types of REX Flexible Metal Hose.

REX Flexible Metal Hose can be bent to position by hand and coupled, in a fraction of the time required to fit a pipe connection. It is readily snaked into place and secured without intermediate joints or elbows, in complicated installations where multiple turns exist in several planes. There is a type of REX Flexible Metal Hose designed to give superior performance under almost any operating condition. In addition, experienced Chicago Metal Hose engineers are available to work with you on special problems when required.

Use our product diversity to speed your product design

HOW SULPHUR SERVES INDUSTRY

SULPHURIC ACID

{Contact Process}

Sulphur is burned to sulphur dioxide (SO_2). This is cooled, filtered, and passed to a converter. Here a catalyst causes the sulphur dioxide to take on an atom of oxygen to form sulphur trioxide (SO_3). Sulphur trioxide then compounds with water into sulphuric acid (H_2SO_4).

Sulphuric acid is used in the preparation of so many products—fertilizer, rayon, steel, textiles, etc.—that it has been called the "pig iron" of the chemical industry. Its consumption is the yardstick often used to gauge the volume of industrial activity. It is easily and economically made from Sulphur produced by Texas Gulf because it is 99½% pure and free from arsenic, selenium and tellurium.

Sulphuric acid is of vital importance to American industry. To the acid manufacturer, a dependable source of Sulphur is of equal importance. Texas Gulf Sulphur Company has above ground ready for shipment more than a year's supply for the entire nation. This, together with large underground reserves and efficient mining methods, is assurance of an unfailing supply.

Monday

6:30— Divisional dinner, Washington Room, Hotel Touraine, $1.65.

Tuesday Morning

SECTION A. SYMPOSIUM ON KINETICS USING TRACER ISOTOPES

Room M, Hotel Statler

W. F. Libby, *Presiding*

9:00— 1. W. F. Libby. Introduction.

9:10— 2. Glenn T. Seaborg. Review of Artificial Radioactive Isotopes Useful as Tracers.

9:55— 3. Edwin O. Wiig. Radio-Bromine and -Iodine as Aids in the Determination of Certain Reaction Mechanisms.

10:40— 4. H. C. Anderson and R. D. Fowler. The Kinetics of Exchange Reactions of Radio-Active Bromide Ion with α-Bromo Carbonyl Compounds.

11:25— 5. W. F. Libby. Kinetics of Certain Thermal and Activated Exchange Processes.

SECTION B. PHYSICAL AND INORGANIC CHEMISTRY

Room K, Hotel Statler

W. C. Fernelius, *Presiding*

9:00— 6. I. Amdur. Average H—H_2 Repulsive Potential from Collision Cross-Section Measurements.

9:20— 7. Hugh M. Spencer and Gordon N. Flannagan. Empirical Heat Capacity Equations of Gases.

9:40— 8. R. L. Livingston and L. O. Brockway. The Structures of Dimethyl Silicon Dichloride, Methyl Silicon Trichloride, and Trifluoro Silicon Chloride.

10:00— 9. L. O. Brockway, J. H. Secrist, and C. M. Lucht. The Structures of CHF_3, $CClF_3$, CF_3CF_3, CH_2CF_2, and CHF_2CHF_2. The Effect of the CF_3 Radical on Attached Groups.

10:20—10. Harold Simmons Booth and Reuben Alexander Osten. The Fluorination of Chlorosiloxane.

10:40—11. Edwin M. Larsen, W. Conard Fernelius, and Laurence L. Quill. Concentration of Hafnium; Preparation of Hafnium-Free Zirconia.

11:00—12. D. W. Pearce and R. G. Russell. Fractionation of the Rare Earths by Zeolite Action.

11:20—13. Melvin L. Schultz and Ernest F. Lilek. Absorption Spectra of Some Double Salts Containing Cobaltous Chloride.

11:40—14. Joseph J. Burbage and W. Conard Fernelius. A Zerovalent Compound of Palladium.

Tuesday Afternoon

SECTION A. SYMPOSIUM ON KINETICS USING TRACER ISOTOPES (*Continued*)

Room M, Hotel Statler

W. F. Libby, *Presiding*

2:00—15. Victor K. La Mer and Frank Brescia. Deuterium Kinetics in Solutions.

2:45—16. A. R. Olson. A Possible Form of the Rate Equation.

3:30—17. A. Farkas. The Mechanism of the Catalytic Exchange of Hydrogen Atoms in Hydrocarbons.

4:15— General discussion of techniques.

SECTION B. SYMPOSIUM ON FLOW UNDER ABNORMAL CONDITIONS

Room K, Hotel Statler

H. Mark, *Presiding*

2:00—18. H. Mark. Introduction.

2:10—19. Robert Simha. On Anomalies of Elasticity and Flow and Their Interpretation.

3:00—20. William D. Harkins. Flow in Two-Dimensional Systems.

3:50—21. Nelson W. Taylor. Anomalous Flow in Glasses.

4:40—22. Elmer O. Kraemer. Anomalous Viscosity of Organic High Polymers.

Wednesday Morning

SECTION A. PHYSICAL CHEMISTRY

Room M, Hotel Statler

O. K. Rice, *Presiding*

9:00—23. J. E. Ricci and G. J. Nesse. Solubility of Potassium Iodate and Zinc Iodate in Dioxane-Water Mixtures. Effect of Sorting of Solvent Molecules.

9:20—24. B. A. Smith, A. L. Courtney, and Brother Columba Curran. Dielectric Properties of Butylacetylene in Oxygen-Containing Solvents.

9:40—25. Elizabeth Monroe Boggs and John G. Kirkwood. Theory of the Transitions Due to Hindered Rotation in the Solid Hydrogen Halides.

10:00—26. Robert Ginell and Robert Simha. On the Kinetics of Polymerization Reactions. I. First Order Initiation of Chains.

10:20—27. Robert Ginell and Robert Simha. On the Kinetics of Polymerization Reactions. II. Second Order Initiation and Mutual Stabilization of Chains.

10:40—28. J. Abere, G. Goldfinger, H. Mark, and H. Naidus. Kinetics of Styrene Polymerization in Various Solvents.

11:00—29. T. Alfrey, G. Goldfinger, and H. Mark. The Nature of the Second Order Transition in Polystyrene.

11:20—30. Charles P. Roe and Roswell H. Ewart. An Electrophoretic Study of the Proteins in Rubber Latex Serum.

SECTION B. INORGANIC CHEMISTRY

Room K, Hotel Statler

W. C. Fernelius, *Presiding*

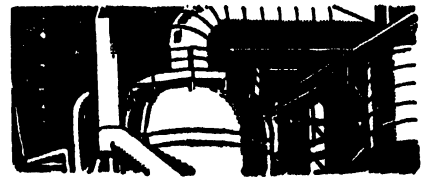
9:00—31. Noel F. Albertson and W. Conard Fernelius. Addition Compounds of Sulfur Dioxide.

9:20—32. G. R. Finlay and A. W. Laubengayer. Donor-Acceptor Bonding in the Etherates of Boron Trifluoride.

9:40—33. S. H. Bauer, G. R. Finlay, and J. M. Hastings. The Structures of Substitution and Addition Compounds of Boron Trifluoride.

10:00—34. Herbert C. Brown and Richard Adams. Studies in Stereochemistry. II. Steric Strains as a Factor in the Stability of Some Etherates of Boron Fluoride.

10:20—35. Louis E. Marchi, W. Conard Fernelius, and James P. McReynolds. The Stereochemistry of Coordination Number Eight.



10:40—36. J. P. McReynolds and L. E. Marchi. Chemical Studies on Configuration of Inorganic Octa-Covalent Compounds: Optical Activity.

11:00—37. R. S. Weisz and A. W. Laubengayer. A Hydrothermal Study of Equilibria in the System Alumina-Water.

11:20—38. W. F. Ehret and D. H. Gurinsky. The Thermal Diagram of the System Iron-Tin.

11:40— Annual business meeting.

ROLL CALL

OF OUR SYNTHETIC RESIN PRODUCTS IN THE WAR EFFORT

☆ ☆ ☆ ☆ ☆

EVERY day our synthetic resins are helping America grow stronger in the air and on land and sea. Some are "veterans" we introduced as far back as 1926; others have been performing special jobs in industry for several years; still others are new "soldiers" developed specifically to solve war problems. In one respect, these synthetic resins are identical—all are quality products that work and fight well.

PLYWOOD ADHESIVES

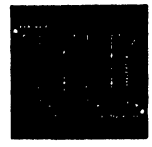
Today's rapid production of plywood airplanes, motor torpedo and assault boats is largely due to the advent of TEGO phenolic resin film in 1935. This resin adhesive made possible the first completely weather-, water-, and fungus-proof plywood. The newer cold-setting resin adhesive, UFORMITE CB-551, is setting new standards in structural fabrication where extremely strong, wood-to-wood bonds are required

WOOD AND METAL COATINGS

Modern quick drying oleoresinous finishes began with the introduction of AMBEROL phenol formaldehyde resins in 1926. The DURAPLEX alkyd type finishes, UFORMITE urea formaldehyde type finishes are two other major classes of finishes developed in our laboratories which are speeding the production of wood and metal war products. For speed-of-dry, and durability, such finishes are widely used on tanks and jeeps.

RESIN EMULSION PAINTS

Over 10 years ago, work was started in the Resinous Products & Chemical Laboratories to find out how synthetic resin emulsions could be used as paints. The resin emulsion, AQUAPLEX, resulted and has become the base of many paints now used to camouflage gun emplacements, munitions depots and large war plants. Many of the government's largest building projects are using AQUAPLEX base paints for lasting protection.



SYNTHETIC RUBBER PLASTICIZERS

Nearly all of the vitally needed synthetic rubbers work faster and better when they are plasticized or "softened" during processing. Our PARAPLEX synthetic resins perform this function of "softening" synthetic rubbers excellently, especially in the case of the buna types. The PARAPLEXES are valuable, too, in improving synthetic rubber used where high resistance to solvents and heat and low temperature flexibility are required.

GAS RESISTANT COATINGS

Cloth that resists the deadly mustard gas is one important product that is being made with the aid of our PARAPLEX and UFORMITE synthetic resins. These resins are used in combination to create a tough, permanently pliable coating. Other important and novel applications of the tough, rubbery PARAPLEX resins include permanently flexible coatings and adhesives, caulking compounds, and special coatings for rubber.

ION EXCHANGERS

The production of large amounts of very pure water is a constant problem to many war industries. In many cases a water equivalent to distilled in degree of purity is absolutely essential. To one war industry, AMBERLITE Ion Exchange Resins are now bringing a complete answer to this problem by providing very pure water at a new low cost. These new resins, first made available by us in the United States are uniquely fitted for many war jobs.

COMPLETE TECHNICAL ADVISORY SERVICE

If the development or application of synthetic resins are a part of your war production problem, our wide experience in synthetic resins may prove of value to you. For over fifteen years we have concentrated our work in the manufacture of synthetic resins and their applications. This work has taken us into almost every field of industry. Very often the wide experience developed in one field of application may prove of value in widely divergent uses. We invite your inquiry concerning wartime applications for synthetic resins.

Centrifuge, with explosion proof motor, for hazardous locations

To meet the demand of the Oil Industry for a large centrifuge with an explosion proof motor, the International Model AE Centrifuge was developed. The Model AE, equal in size and capacity to the Size 2 Centrifuge, has a maximum speed of 1,700 r.p.m. which is sufficient for the testing of oils. However, the Chemical and Paint Industries require the higher speeds of the new explosion proof motor which is now available.

INTERNATIONAL MODEL BE CENTRIFUGE

with explosion proof motor of 3,450 r.p.m.

accommodates the regular centrifuge equipment and has the safety features of the Model AE with the added advantage of higher speed for more general industrial uses. The special adjustable high speed motor is approved for Class 1—Group D locations.

A speed regulator and disconnect switch are mounted permanently in a vaporproof box on the side of the centrifuge and connected through conduit and explosion proof fittings to the motor. The sealed ball bearings of the motor require no attention. A conveniently located hand brake permits rapid stopping.

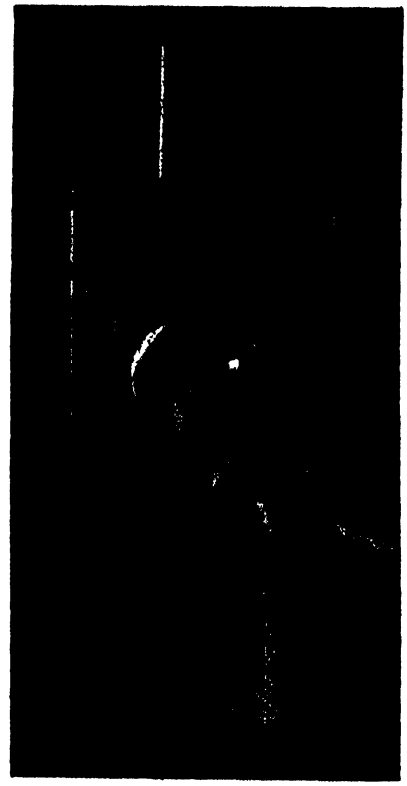
Further information upon request

INTERNATIONAL EQUIPMENT CO.
352 Western Avenue Boston, Mass.

Makers of Fine Centrifuges for more than forty years.

New Communities, especially, must determine

The Degree of Aggressivity



The Marble Test for determining the stability of water has been simplified.

With the Enslow Stability Indicator, it now becomes a dependable, non-time consuming procedure. At one operation, the Langelier Index is revealed by making two simple pH determinations.

Two outstanding features of the device are a constant head tank and a specially designed calcium carbonate contact chamber which holds the charge of precipitated chalk.

Other features of the Enslow include an air-bleeder on the primary trap tube to preclude pressure build-up and possible cracking of the glass tubes. Adjustable rubber stopper clamps add materially to the convenience of handling.

With the Enslow in continuous service, the chemist always finds a prepared sample of marble treated water and, without changing the apparatus, a later sample will show the effectiveness of altered chemical dosages. The test procedure will be sent upon request.

A 83-895 Enslow Improved Model costs only $62.50

4:25—12. George E. Symons. The Sewage Treatment Works at Buffalo, N. Y.

4:45— Meeting of the Executive Committee.

6:30— Divisional dinner, Delaware Room, Hotel Touraine, $1.65.

Wednesday Morning

9:00— Start from Hotel Statler for Inspection Trip of the Buffalo Sewage Works. Admission to plant by badge only.

Kaolin Production in Sweden

Annual production of kaolin by the Swedish Kaolin Syndicate founded in 1941 at Fyledalen, Sweden, is placed at 6,000 metric tons. At Sjobo plants have been erected and equipment installed for extraction of the substance from deposits of quartz sand. Another company operating in the southeastern part of Skane Province normally produces 5,000 tons of kaolin annually.

The Fyledalen product has been found in tests to compare with kaolin imported from England, Sweden's chief source prior to the war. Annual Swedish consumption for paper and porcelain production has been 40,000 metric tons, part of which came from the Danish island, Bornholm, or from Germany and Czecho-Slovakia.

Tenite-Housed Lantern

Tennessee Eastman Tenite housing features this lantern being adopted for use by railway car inspectors, industrial plants, and servicemen throughout the country. The Tenite presents a smooth lustrous surface that is nontarnishing and rustproof. The lantern is exceptionally light in weight, easy to handle, and so strong as to be virtually unbreakable. It is available in black, red, and olive-drab. The lantern is made by the Focal Co., Downey, Calif., and the housing is molded by Modern Plastic Co., 4641 Pacific Blvd., Los Angeles, Calif.

American Chemical Society[1]

104TH MEETING. Buffalo, N. Y., September 7 to 11, 1942.

105TH MEETING. Indianapolis, Ind., April 12 to 16, 1943.

106TH MEETING. Minneapolis, Minn., fall of 1943.

NATIONAL CHEMICAL EXPOSITION and NATIONAL INDUSTRIAL CHEMICAL CONFERENCE. Sherman Hotel, Chicago, Ill., November 24 to 29, 1942.

Other Scientific Societies

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS. Netherland Plaza Hotel, Cincinnati, Ohio, November 16 to 18. Annual meeting.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Vancouver, B. C., September 9 to 11.

AMERICAN OIL CHEMISTS' SOCIETY. Drake Hotel, Chicago, Ill., October 7 to 9.

AMERICAN PETROLEUM INSTITUTE. Palmer House, Chicago, Ill., November 9 to 13. Annual meeting.

NATIONAL LUBRICATING GREASE INSTITUTE. New Orleans, La., October 26 to 28.

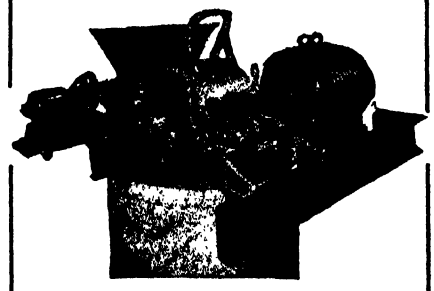
NATIONAL PETROLEUM ASSOCIATION. Hotel Traymore, Atlantic City, N. J., September 16 to 18. Annual meeting.

TECHNICAL ASSOCIATION OF THE PULP AND PAPER INDUSTRY. Hotel Statler, Boston, Mass., September 29 to October 1.

[1] The list of the SOCIETY'S National Officers and Directors, Editors, members of Council, Divisional and Local Section Officers, Committees, and Chapters of Student Affiliates appears in CHEMICAL AND ENGINEERING NEWS three times a year—usually February 10, May 10, and October 10. The latest list is printed on page 601 of the May 10 issue.

Industrial Fiber Meeting Canceled

THE projected meeting of the Industrial Fiber Society in New Orleans, La., in November has been canceled. The organization's Executive Committee has made this decision in the light of requests from government authorities that travel be restricted and also because of the difficulty many persons are having in leaving their work for even a few days. The society, which held its first meeting in Atlanta last December, will not convene again for the duration.



Agfa-Ansco Celebrates Centennial

In celebration of the 100th anniversary of the founding of Edward Anthony's photographic business at 308 Broadway, New York, the Agfa-Ansco Division of General Aniline & Film Corp., descendant of the Anthony enterprise, unveiled a tablet commemorating that fact at the original site. *Left to right.* J. A. Zellers, H. C. Parmelee, and H. C. Lufkin, American Institute of the City of New York, and E. R. Deats and L. W. Sipley, of the American Museum of Photography. At a banquet later in the day at the Waldorf-Astoria, R. E. McConnell, president of General Aniline & Film Corp., announced plans for organization of a research laboratory at Easton, Penna. Further announcements by the company told of new color film which can be developed under amateur darkroom conditions and of a domestic sound track on cellophane film in which the usual silver sensitive salts are replaced by light sensitive diazo dyestuffs.

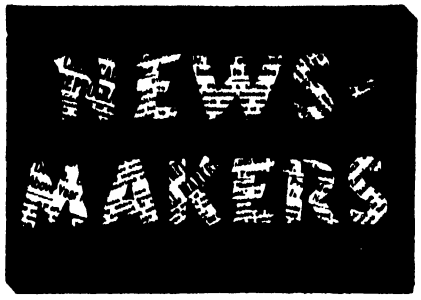
PLANT PRODUCTION

WITH
MIKRO-PULVERIZERS



Research — Development and actual Pilot Plant work can be carried out with the Bantam MIKRO-PULVERIZER, on new products still in the laboratory stage. When details are complete and tonnage production started in the plant, the Bantam results can be interpolated in terms of larger MIKRO-PULVERIZERS with the assurance that laboratory results will be exactly duplicated.

TEN SIZES
CAPACITIES 50 to 15,000 Lbs. per Hr.

All MIKRO-PULVERIZERS, including the Bantam unit, operate on the same fundamental principle assuring duplication of particle size distribution, fineness, density, etc. All units operate without the use of fans, large cyclones or separators; are compact, simple and dustless. Finished product is discharged directly from the pulverizer and can be collected in any one of many ways.

Compare MIKRO performance. Write for complete 32-page catalog.

PULVERIZING MACHINERY CO.
27 CHATHAM Rd.
SUMMIT, N. J.

Having received the Ph.D. degree at the State University of Iowa in May, **Eldon E. Bauer** is employed as a chemist and chemical engineer with the Department of Manufacturing Experiments, Eastman Kodak Co., Rochester, N. Y.

H. K. Clark, vice president and general manager of Norton Co., who recently returned to Worcester after nine months' service as a dollar-a-year man in OPM and WPB, is back in Washington, D. C. He has been "drafted" by the Navy and, with the rank of lieutenant commander, is a member of the Army and Navy Munitions Board.

Norman R. Davidson has been added to the chemistry staff at the Illinois Institute of Technology, Chicago, Ill., as instructor in chemistry. Dr. Davidson was a Rhodes scholar and received his Ph.D. in chemistry from the University of Chicago.

Howard M. Dawson is now in charge of the Export Department of the Jessop Steel Co., with headquarters in New York, N. Y.

John T. G. Dean has resigned his teaching position at Sarah Lawrence College, Bronxville, N. Y., to become industrial fellow at Mellon Institute, Pittsburgh, Penna., doing research for the International Nickel Co.

Elwood H. Ensor, who received his Ph.D. degree from Northwestern University in June 1942, has been added to the research staff of the Synthetics Department at the Hercules Powder Co. Experiment Station, Wilmington, Del.

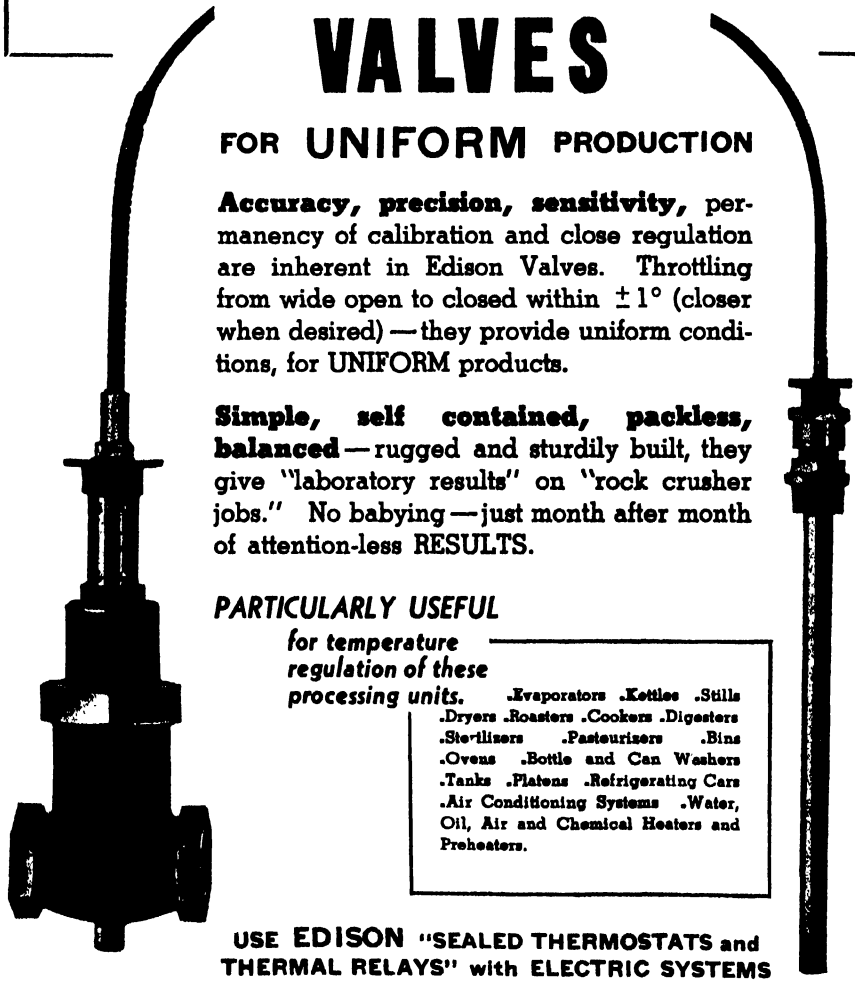
Ralph W. Frey has been awarded the W. K. Alsop Award by the American Leather Chemists Association for "outstanding research work advancing the art of science of leather manufacture". Dr. Frey, a research chemist with the U. S. Department of Agriculture, has done special work on barks and materials and storage and curing of hides and skins to retard deterioration.

Bernard J. Gaffney is now chemical engineer in charge of pilot plant production of the American Oak Leather Co., Cincinnati, Ohio.

V. F. Hribar has been granted a leave of absence from his duties as chief chemist of the American Lumber and Treating Co., Chicago, Ill., to accept a commission in the U. S. Naval Research and has reported to Dartmouth College for active duty.

Herbert J. Kerr, who received his master's degree in chemical engineering at the University of Tennessee June 1, 1942, is now junior chemical engineer for the Tennessee Valley Authority at Muscle Shoals.

Faculty members recently promoted at the Michigan College of Mining and Technology are **R. F. Makens**, associate professor, who is in charge of the work in organic chemistry, and **Russell J. Smith**, assistant professor in metallurgical engineering, who is also engaged in research upon heating rate control and metallurgical tests.



Robert W. Manuel, formerly with the Research Laboratories of the Crane Co., is now chemical engineer in the Metallurgical and Chemical Department of the Goodyear Aircraft Corp.

EDISON
THERMOSTATIC STEAM
VALVES
FOR UNIFORM PRODUCTION

Accuracy, precision, sensitivity, permanency of calibration and close regulation are inherent in Edison Valves. Throttling from wide open to closed within ±1° (closer when desired)—they provide uniform conditions, for UNIFORM products.

Simple, self contained, packless, balanced—rugged and sturdily built, they give "laboratory results" on "rock crusher jobs." No babying—just month after month of attention-less RESULTS.

PARTICULARLY USEFUL
for temperature regulation of these processing units.
.Evaporators .Kettles .Stills .Dryers .Roasters .Cookers .Digesters .Sterilizers .Pasteurizers .Bins .Ovens .Bottle and Can Washers .Tanks .Platens .Refrigerating Cars .Air Conditioning Systems .Water, Oil, Air and Chemical Heaters and Preheaters.

USE EDISON "SEALED THERMOSTATS and THERMAL RELAYS" with ELECTRIC SYSTEMS

INSTRUMENT DIVISION • WEST ORANGE, N. J.

F. L. Mark has been appointed head of the technical and research staff of the asphalt section of the Dicalite Co.'s laboratory, recently established at its California plant. Immediate emphasis of the work is being placed on camouflage paints.

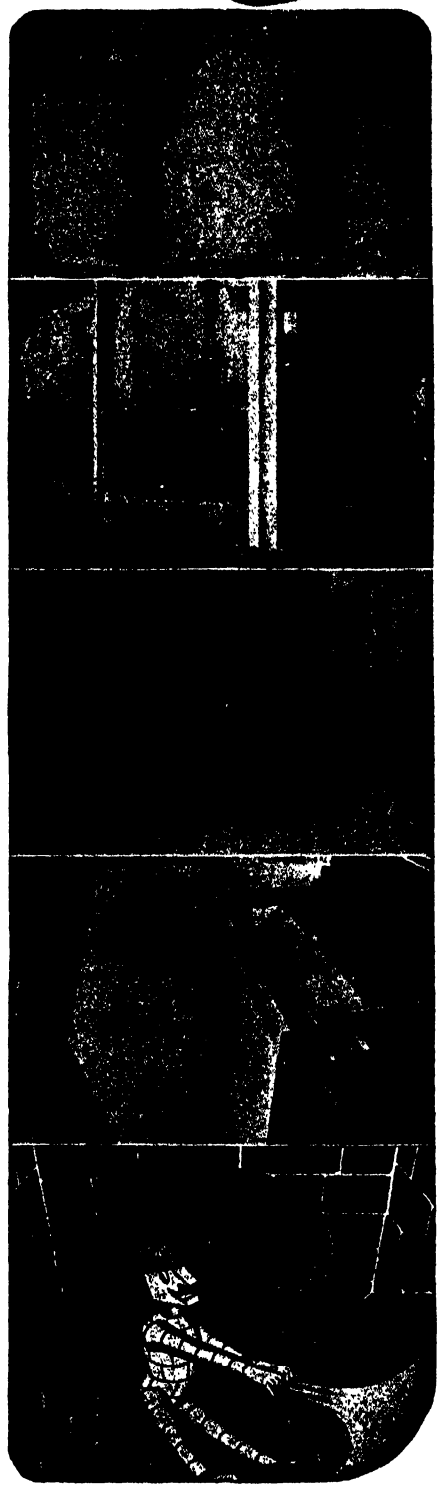
F. L. Mark

John W. Moore, formerly tutor in physical chemistry at the University of Texas, is now junior chemical engineer, Development Section, Research and Development Division, Department of Chemical Engineering, Tennessee Valley Authority, Wilson Dam, Ala.

S. H. Mortensen has been appointed chief electrical engineer of the Allis-Chalmers Mfg. Co. plants at West Allis, Cincinnati, Boston, and Pittsburgh.

George B. Murphy, formerly manager of the research and development laboratories of Universal Oil Products Co. and more recently editor of *The Refining Technology Edition* of *National Petroleum News*, has joined the staff of E. B. Badger & Sons Co., Boston, Mass., as engineer.

Roland W. Oberholtzer, Jr., has been transferred from the Giant, Calif., plant to the Atlas, Mo., plant of the Atlas Powder Co., in the capacity of powder supervisor.



Benjamin F. Parlett, Jr., has been appointed to the sales force of the Hanson-Van Winkle-Munning Co., Matawan, N. J.

Peter I. Pollak, after leaving the Graduate School of Arts and Science of New York University, has accepted a position as research chemist and development chemist at the Warwick Chemical Corp., 221 West 57th St., New York, N. Y.

Robert H. Pyle has been appointed district representative for the McKenna Metals Co., with headquarters in Indianapolis, Ind.

STEBBINS *Quality*

LININGS & TILE TANKS

. . . . provide process plants wherever acids, alkalies, corrosive or non-corrosive liquids, gases or vapors are encountered, with an efficient, economical, long-lived and trouble-free installation.

Where sludges, brines, bleaching solutions, process water, pulps, dust, salts, granular products, etc., are to be stored, the new STEBBINS tile tank can be installed without waiting.

Fifty-eight years' experience in meeting specific operating conditions in a great many process plants has provided STEBBINS with one ingredient that is vital today—KNOWLEDGE.

To know how to do a first-class job—saves TIME. Ask STEBBINS when you have a lining or tank problem.

NECROLOGY

Carl F. Dahlberg

CARL F. DAHLBERG, a founder of the Celotex Corp. and a prominent New Orleans business man, died July 26 in Atlanta, Ga. Mr. Dahlberg was 63 years old.

Born in Christianstad, Sweden, he came to this country when very young. After attending elementary school he entered the Operating Department of the Northern Pacific Railroad and later served in the Traffic Department of the Northwestern Railroad. In 1921 Mr. Dahlberg joined his brother, Bror, in founding the Celotex Corp. and served as its first vice president. In 1930 he was a member of a committee to reorganize the company. During the last 10 years Mr. Dahlberg was president of the South Coast Corp., one of the largest cane sugar producing companies in the country, and vice president and a director of the South Shore Oil and Development Co. in Louisiana.

Frank S. Dunham

FRANK S. DUNHAM, associated with The Permutit Co. in the sale of water-conditioning equipment for approximately 25 years, died in Chicago on July 23, 1942.

Born in Baltimore, Md., on March 8, 1876, he studied at the Armour Institute of Technology and the University of Chicago. His early career in engineering began with the Hydrox Corp. of Chicago, which he joined following graduation from the university. Subsequently, he was a chemical engineer with the Kennicott Co., manufacturer of water-softening equipment, until he became associated with The Permutit Co. He remained with The Permutit Co. until his retirement in 1940.

Clarence A. Hall

CLARENCE A. HALL, chairman of the board of the Bartol Research Foundation, died July 20 in Chestnut Hill, Penna., at the age of 68. Mr. Hall, who had been a member of Franklin Institute for 40 years and a member of the Committee on Science and the Arts since 1906, was a graduate of the University of Pennsylvania. He had been associated with the Electric Storage Battery Co. for 22 years, and previously had been connected with the Pennsylvania Salt Manufacturing Co., the Lake Superior Carbide Co., the Union Carbide Co., and the Lake Superior Corp.

Mr. Hall had been a member of the AMERICAN CHEMICAL SOCIETY since 1895. He was also a member of the American Ceramic Society, the American Institute of Mining and Metallurgical Engineers, the Electrochemical Society, the Faraday Society, and the Chemical Society (London).

Ondress L. Inman

ONDRESS L. INMAN, director of the Kettering Foundation for research in chlorophyll and photosynthesis at Antioch College, Yellow Springs, Ohio, died July 21 in New York at the age of 51.

Richard Willstätter

RICHARD WILLSTÄTTER, winner of the 1915 Nobel Prize in Chemistry, died in Switzerland on August 3, at the age of 70.

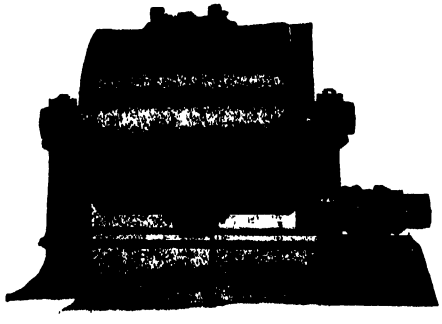
Dr. Willstätter was born at Karlsruhe, Germany, and was educated at the University of Munich. In 1902 he succeeded Johann Thiele as extraordinary professor of organic chemistry at the University of Munich, then taught at the Technische Hochschule at Zurich and the Kaiser Wilhelm Institute in Berlin. He returned to Munich in 1916 as professor of organic chemistry and director of the chemical laboratories. He resigned in 1924, because of the anti-Semitic policy of the university, and since 1939 had been living in retirement at Berne.

Dr. Willstätter received the Nobel Prize in Chemistry for outstanding chemical research, notably his study of plant pigments. He established the identity of chlorophyll, and then turning to enzymes revolutionized research in this province of science.

In 1927 he was made an honorary member of the AMERICAN CHEMICAL SOCIETY. He was awarded the Davy Medal of the Royal Society, London, in 1932, and in 1933 the Willard Gibbs Medal of the Chicago Section, AMERICAN CHEMICAL SOCIETY.

On August 13 Dr. Willstätter would have celebrated his 70th birthday. As a tribute to this eminent scientist on this anniversary, a synopsis of his life and achievements was printed in the August 10 issue of CHEMICAL AND ENGINEERING NEWS, page 954.

WE ANNOUNCE with regret the death of the following A. C. S. members:



Edward C. Billheimer, Brooklyn, N. Y. Member since 1938.

Henry P. Busch, director, Shoemaker & Busch, Philadelphia, Penna. Member since 1920.

Richard M. Cone, captain, Chemical Warfare Service, U. S. Army, Syracuse, N. Y. Member since 1932.

RUNS 24 HOURS A DAY
7 DAYS A WEEK . . .
UNSKILLED LABOR REQUIRED 1 HOUR A DAY
PAUL O. ABBÉ
BALL & PEBBLE MILLS

were made for times like these. In the average grinding and mixing job, they will operate 24 hours a day, 7 days a week, with only 1 hour unskilled labor a day.

Maintenance, too, is low. One user reports *100,000 hours use without replacement of a part, nor of lining.*

For any grinding or mixing job where little labor, or unskilled labor is available, use Paul O. Abbé mills, *the mills with 65 years experience behind them.*

Agricultural Plastics

PLASTICS of high impact strength and low water absorption can be produced from low-cost agricultural products and by-products, it is revealed by the Iowa Engineering Experiment Station in Bulletin 154, "Plastics from Agricultural Materials".

Experiments by Drs. Sweeney and Arnold show the commercial possibilities of plastics made from such raw materials as soybean meal, furfural, corncobs, oat hulls, and cornstalks. The bulletin reports in detail the effect of varying the raw material combinations, molding conditions, time and temperature of cooking, and other procedures, together with specific recipes for the plastics judged best after many years of study and experimentation. Reactions of phenol and sulfuric acid with the individual corncob constituents are discussed in detail.

Copies of the 52-page bulletin may be obtained without charge from the Iowa Engineering Experiment Station, Iowa State College, Ames, Iowa.

AN IMPROVED echo-sounding apparatus, similar to that used in detecting submarines, is being used to detect seaweed needed for manufacture of iodine. The apparatus permits accurate soundings at ordinary ship speed. Soundings can be taken at depths as low as two fathoms below the keel, it is said.

FOR ALL TYPES OF SCALES

The Chemist's Chance

I HAVE read the original article, "The Chemist's Chance" by Otto Eisenschiml, printed on page 368 of the March 25, 1942, issue of CHEMICAL AND ENGINEERING NEWS and the comments thereon appearing on page 742 of the June 10, 1942, issue, with great interest. You should be encouraged in printing these and similar articles. CHEMICAL AND ENGINEERING NEWS could be and should be a sounding board for the views of chemists on issues which are not necessarily scientific, but which are of extreme importance nonetheless.

Mr. Eisenschiml is correct. "We may not be given another chance like this in our generation." Today we are in a seller's market. Today we have the golden opportunity to drive home the point that we are valuable members of society. Today we can sell the proposition that we, as chemists, are important units in the march of human progress.

Yet, what are we doing about it? It is true that the AMERICAN CHEMICAL SOCIETY has made and is making efforts to establish the professional status of chemists. That is all well and good, but the force of the SOCIETY is no more than the combined forces of the individual members. Without a spirit and a drive and an action for the cause by each member, the SOCIETY as a whole is impotent.

While it is dangerous to condemn the group for the shortcomings of its individual members, it is unfortunately true that too many chemists lack zeal and resourcefulness in activities other than those of their own profession. Too many chemists, often in an admirable enthusiasm for their own work, neglect the development of other qualities which make up the well-rounded individual. Too many chemists have not cultivated the art of associating easily with people. Too many chemists do not do themselves justice in the eyes of laymen. These failures as individuals are the limiting factors in the success of the efforts which the SOCIETY is attempting. How can the organization attain for us a higher place in the sun if we as individuals lack the requisite qualifications?

Well, what's to be done? Consider the members of one of the "noncreative occupations", the lawyers, who, nevertheless, draw fat salaries, fees, or other emolument, and who, for the most part, are respected members of society. Do you know a truly successful lawyer who does not know how to handle people, who is not a good mixer, who cannot sell himself? Or, consider a successful business executive, perhaps the same executive who scooped the gravy from an inventive chemist. Can you think of him as one who stands quietly, and lets the world go by him? No, he is a man who senses well his opportunities, and who exploits them to the utmost.

How, then, do these "noncreative" come to assume position and authority over the creative? How do they dominate the destinies of those who are responsible for scientific and technological progress? It certainly is not because of their superior intellectual power. No, it is because they have developed the acuity to manage relations between men, the power to put themselves across to their fellows.

Since we chemists aspire to a greater appreciation by the rest of society and to a higher level therein, it is fundamental that we master the techniques of initiating and maintaining more friendly relations with people. We must give ourselves the opportunity of letting them know us.

Not only that, but as they come to know us better, they will have a livelier interest in and appreciation of the contributions which chemists have made to the betterment of living. Then they will want to know who gave the world aspirin, ethyl gas, concrete, sulfa compounds, vitamins, plastics, and the like. Then, people will actually help us remove the chemist's light from under the bushel.

Responsibility for the achievement of this goal lies first with us as individuals. We must search ourselves for our own social shortcomings and we must correct them. Then, and only then, can we, as individuals and as an organization, spread the word until we are no longer "unknown soldiers".

SAMUEL D. KOONCE

2375 NEIL AVE.
COLUMBUS, OHIO
June 22, 1942

Editor, Chemical and Engineering News:

THE Chemist's Chance" is frequently diverted to one who is not a chemist because, in the minds of many, a chemist is an analyst, not a synthesist. If they wish to develop a product they employ one of the many kinds of engineers to put things together and keep the chemist in the background, although relying on him to point out mistakes with his analyses. This would not happen so often if the employer had a better idea of what a chemist should be expected to do, and if the chemist were given a more accurate picture of his function in the organization.

When a man applies for a position he gives details of his previous experience and training. His prospective employer usually makes vague promises of future advancement, but his past record regard-

Announcing Hercules' Newest Varnish Resin

PENTALYN M

FOR TOUGH THROUGH-DRY IN LINSEED OIL VARNISHES

Pentalyn M, the latest addition to Hercules' series of outstanding varnish resins,* is specifically designed to produce acceptable varnishes from linseed oil.

Tough through-dry, more complete than has heretofore been possible with other varnish resins, is developed after an overnight drying period.

Rapid top-dry is not sacrificed. Pentalyn M develops the same outstanding speed of top-dry in linseed varnishes as does Pentalyn G, with which you are no doubt familiar.

Faster cooking is also achieved with this new resin. You will find this characteristic useful in either of two ways: (1) by starting with less viscous pre-bodied oils and cooking the usual times, or (2) materially shortening the cooking period when using heavier bodied linseed oil.

Pale varnishes, suited for clears or pale tints, are readily produced.

Further information about this unusual new varnish resin is available. Write today for helpful data on Pentalyn M, or any other Hercules resin.

ing treatment of his employees is not open to the applicant. If the AMERICAN CHEMICAL SOCIETY would collect these data both from employers and employees who have left jobs, it would be a service to the members, the companies, and to the country. There is talk of freezing employment because men are leaving positions in one essential industry for better paid positions in other essential industries. If the change enables a man to use more of his knowledge, it means a saving and should be encouraged instead of stopped. If the change is made because of false or overoptimistic representations of the advantages of the job, it constitutes a waste and a repetition could be avoided by a word from the SOCIETY. It is questionable if these data could be collected in time to be of service in the present emergency, but whenever they are collected they will help the chemist to find his proper place in industry and thence in society.

Fuel Research at Illinois Institute

SCIENTISTS at Illinois Institute of Technology, Chicago, Ill., will aid in research to develop new and more powerful fuels for America's war effort.

The spectroscopy laboratory staff has been asked to cooperate in the American Petroleum Institute's research project in the Raman spectra of new hydrocarbons. The investigation is expected to result in the development of more powerful and more efficient fuels for internal combustion engines, especially aviation engines.

Illinois Tech Starts Cooperative Chemistry Program

INDUSTRY and education in Chicago will combine their resources to train chemists for a Nation at war under a new cooperative program at Illinois Institute of Technology. Fifty students, including six girls, have entered Illinois Tech classrooms in the first academic session of a new cooperative course in chemistry, after completing 16 weeks of work in industry, while a similar group will begin study in September.

The program, the first of its kind in the Chicago area, was organized this spring and recently put into complete operation. Students alternate throughout the 12-month year between 16-week periods each working in industry and studying in the classroom. Cooperating plants hire the students in pairs, so that one works while the other studies.

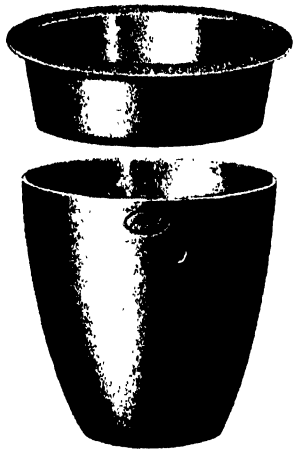
The cooperative plan not only allows students to earn a large part of their expenses while completing work for an engineering degree in five years, but also gives them the advantage of actual experience in industry. Academic work in the chemistry program is being done at the institute's Lewis campus, 1951 West Madison, Chicago.

Fellowship in Nutrition

THE medical school of Harvard University has received from Swift & Co., Chicago, a grant to be used in nutrition research for the current year. The award concludes the grants of fellowships in nutrition by Swift for this year.

The fellowship will be used in a study of parenteral nutrition under direction of Allan M. Butler.

Subject of the investigation is the optimal nutrition that may be provided by parenteral fluid therapy and involves the relationships of the therapy to nutritional deficiencies in children and certain surgical cases.



Fellowships in nutrition which Swift & Co. has established this year in American colleges and universities include those placed with Harvard, Columbia, and Cornell Universities, Kansas and Pennsylvania State Colleges, and the Universities of Pittsburgh, Texas, Nebraska, Minnesota, Chicago, California, Wisconsin, Georgia, and Rochester.

New Welding Standards

THE American Welding Society has recently published two welding standards, entitled "Standard Methods for Mechanical Testing of Welds" and "Definitions of Welding Terms and Master Chart of Welding Processes." Both were prepared by technical committees of the society and are revisions of earlier bulletins of the same title.

These standards are published in bulletin form, with a heavy paper cover, and are available at 40 cents a single copy from the American Welding Society, 33 West 39th St., New York, N. Y.

Recent additions to the staff of the Central Technical Laboratory, Armstrong Cork Co., Lancaster, Penna., included: **Irving E. Adams**, formerly with the Hazel-Atlas Glass Co.; **M. S. Lewis**, formerly with the Standard Pigment & Wallpaper Co.; **R. A. Stafford**, formerly with Spaulding & Co.; **W. S. Subblebine**, formerly a member of the faculty of the Pennsylvania State College, and **Roger S. Brown**, formerly with the Barrett Co.

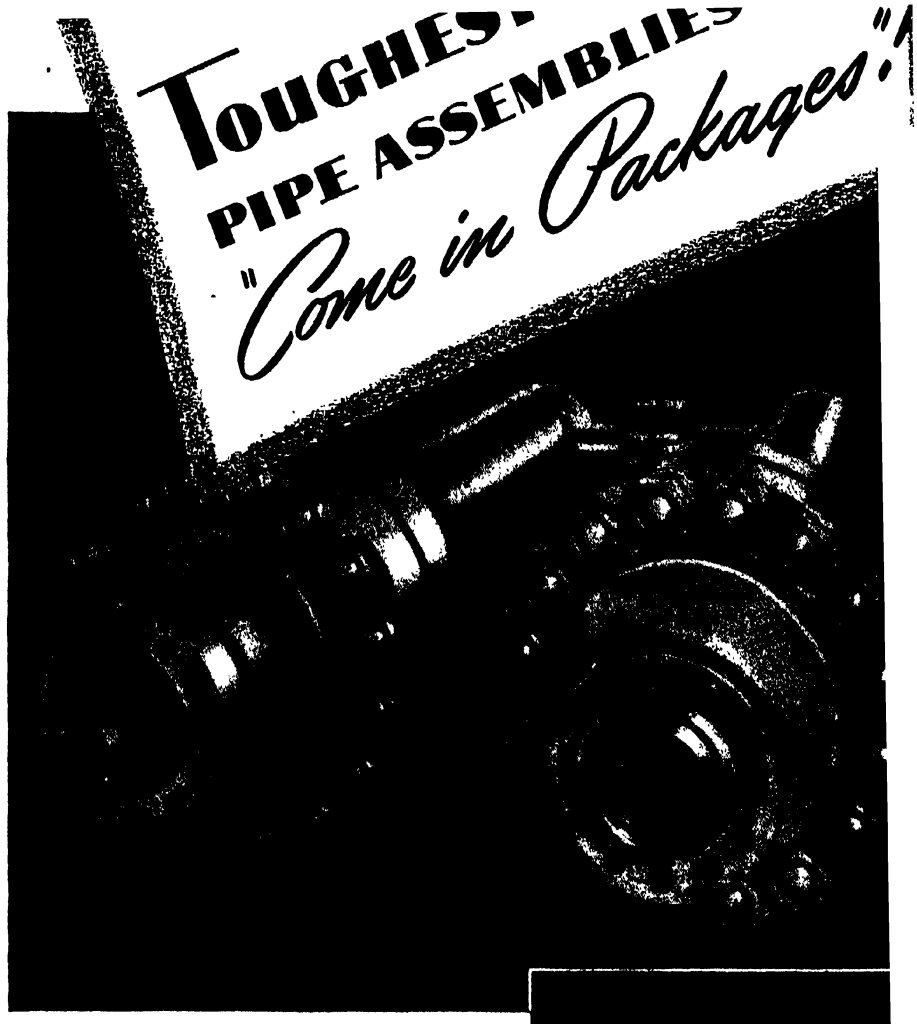
Lubricants Developed

DEVELOPMENT of a plywood "victory drum" for use in marketing greases will enable Standard Oil Co. (Ind.) to save for war uses 2,000 tons of steel a year formerly required for packaging heavy lubricants. Although similar to steel drums in appearance, the new containers are made of wooden sheets laminated together. The only metal in them is in fasteners holding ends of sheets together and in a ring for use in lifting the removable lid. The inner surface is lined with a chemical which prevents greases from creeping through pores in the wood.

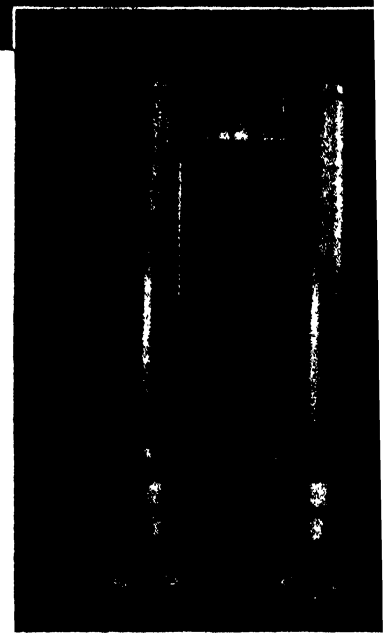
Standard's shipments of heavy lubricants, greases, and petrolatums will be made in the new containers as fast as they can be obtained. The drum was developed by the company in accordance with the Petroleum Coordinator's program for conservation in use of containers. It is being made in 100-pound, 50-pound, and 25-pound sizes.

Standard Oil Sets Safety Record



A NEW world safety record for the petroleum industry has been set by the more than 1,000 employees of the Wood River, Ill., refinery of Standard Oil Co. (Ind.), who are producing fuels and lubricants for the armed forces, war industries, and the farm front.

The record is 6,850,000 man-hours of work without loss of time or disabling injury because of accident. The record ended when a pumper helper stumbled and fell while descending the stairway on a tank where he had been taking inventory.



The former safety record for the petroleum industry was 5,791,899 man-hours set by the Standard of Indiana manufacturing department in 1941. The former safety record for individual refineries was 4,216,623 man-hours set by the Baton Rouge, La., refinery of Standard Oil Co. of Louisiana in 1940.

INDUSTRIAL uses of soap are being publicized in a new mimeographed bulletin issued by the Association of American Soap & Glycerine Producers, Suite 2050, 11 West 42nd St., New York, N. Y. With war restrictions on the production of many synthetic chemicals and other raw materials, the association believes technicians in a number of industries are interested in widening applications for the soap in various steps of processing. Aim of the bulletin is to report new developments noted in patent and research literature or established by experimental work.

High-pressure sub-assemblies like this are delivered to installation sites, underwriter-approved.

new power-piping installa- can be obtained with no more difficulty or personal attention than any *factory-made* item of major equipment!

Prefabrication by Grinnell takes over all the tough fabrication work . . . performs it better and faster . . . delivers the complete job in convenient "packages" consisting of sub-assemblies ready for immediate field hook-up!

"Give the Plans to Grinnell" when your piping requirements are roughed out. Grinnell engineers are equipped by long experience to interpret power and processing layouts into super-piping systems. Grinnell plants, strategically located to serve war industries, have every last facility to prefabricate simple and complex sub-assemblies . . . accurately, efficiently, in least time.

Du Pont Issues Statement on 1942 Activities

PRODUCTION of du Pont materials required for the war emergency, whether of chemicals or explosives, is at an all-time high, Walter S. Carpenter, Jr., president of E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., announced in a statement to stockholders. Plant expansion on an unprecedented scale, largely constructed and operated for the account of the Government, has involved expenditures totaling several hundred million dollars, he said.

The six months' period just ended has marked the practical completion of a significant transition, Mr. Carpenter stated, to satisfy the imperative requirements of the military and the essential civilian needs of a nation at war. In contrast with manufactures today, sales of military products for the 20-year period prior to the present war constituted less than 2 per cent of the total, with approximately 98 per cent chemical products to meet the normal peacetime needs of the people.

Pointing out that du Pont's neoprene was the first so-called synthetic rubber to be produced on a commercial scale, he noted that in the fall of 1941 the company decided to construct a second plant in a new location. Following Pearl Harbor, the United States Government acquired this plant from the company and contracted with du Pont to complete that plant for its account, to construct three more units at the new location, and to operate the plant to produce neoprene for the Government. The first unit will be operating in a few months, and it is expected that the other three units will come successively into operation in 1943, he added.

Mr. Carpenter said that the capacity of the original nylon plant has been doubled and a further new plant has gone into production. The major portion of all vat colors used for military and naval purposes are being made by du Pont, he pointed out, with this country now "self-sufficient in all of its essential dye requirements".

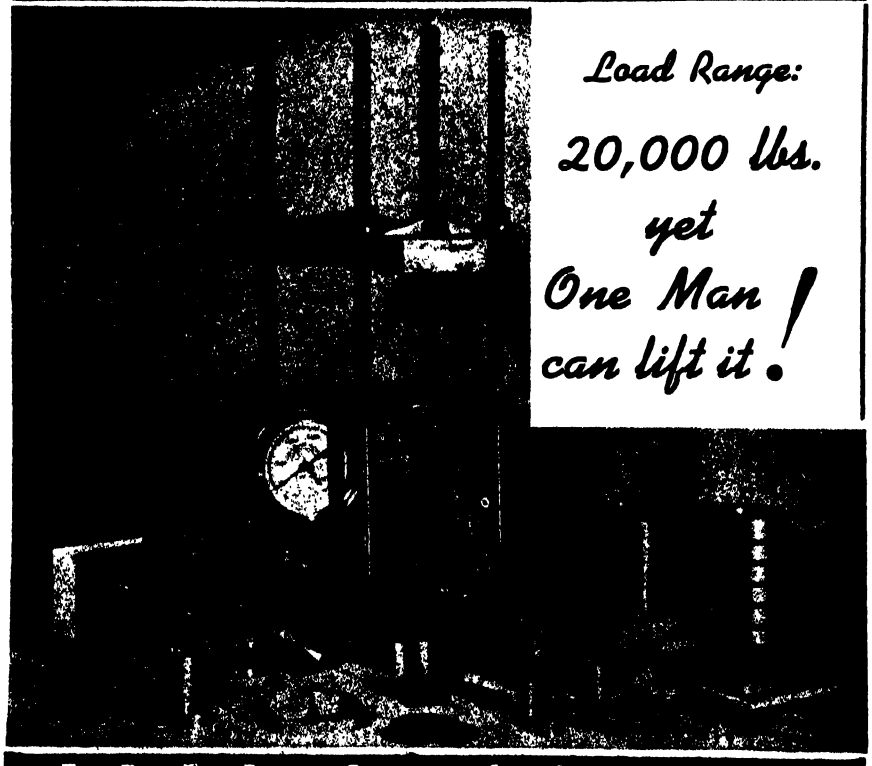
Cordura rayon yarn has been adapted to use in tires for heavy duty on airplanes and mechanized military equipment. Production of cast transparent sheets of Lucite, vital to military airplane construction, during the past six months has been nearly quadruple that for the comparable period of 1941, Mr. Carpenter announced. Output of nitrogen extracted from the air likewise has been substantially expanded. Speed of construction of powder plants and production in plants already in operation have exceeded expectations. Each TNT unit of production, he declared, is now turning out three times the quantity that similar units were able to produce during the first World War.

Many du Pont patents and secret processes have been made available, royalty free, for the production of critical products for the Government during this emergency, Mr. Carpenter explained.

In the statement he noted the fact that during the past six months the company and a number of its officials have been named in six separate indictments obtained by the U. S. Department of Justice against certain units in the chemical industry charging violation of antitrust laws. "The serious import of these matters cannot be minimized", said Mr. Carpenter, "especially in as much as the Government has chosen to institute procedure under the criminal statutes, and extensive litigation may be expected before the issues raised are finally adjudicated."

"This company", he said, "through the enthusiastic and cooperative effort of its employees in all capacities is applying itself to the task of doing its part thoroughly and expeditiously."

Fused Glass Drops Replace Sapphire Jewel Bearings



DROPS of fused hard glass are successfully replacing precious sapphires in production of war-needed electrical indicating instruments, F. K. McCune and J. H. Goss of the General Electric Co. reported before the American Institute of Electrical Engineers in Chicago June 23. The glass substitutes have been developed to the point where they can be produced in quantity and there is little to choose between the two for actual miniature instrument application, Mr. McCune said. One type of glass, called "material II", was chosen as the most satisfactory of any developed during the research since it contains a large percentage of alumina, a substance found native in sapphires which are next to diamonds in hardness.

Sapphire jewel bearings were formerly imported, principally from Switzerland. The war cut off the supply of the jewels and the personnel trained to cut them.

Alcohol Produced from Oranges

A PROCESS for production of 190-proof alcohol from waste citrus fruit for the manufacture of explosives has been announced by the Citrus Products Laboratory, U. S. Department of Agriculture, Winter Haven, Fla. Production costs are said to be approximately two thirds those of producing alcohol from blackstrap molasses. One gallon of 190-proof alcohol and about 12.5 ounces of dry yeast can be made from 25 gallons of waste juice, about 61,000,000 gallons of which are available in Florida canneries.

Hercules Research Expanded

To HANDLE an expanded research program 90 per cent devoted to the war effort, Hercules Powder Co., has employed a group of women chemists and also instituted a night research shift at its central experiment station laboratories. There are more than 204 trained chemists and a total research staff of more than 600 men and women working in the 15 buildings located on a 300-acre plot of land in Delaware. Research expenditures at this Experiment Station in 1942 will approximate $1,500,000.

Mindful of the need to conserve building materials, no new structures are contemplated, although the station has a high priority rating because of the nature of its war work.

To handle the staff expansion, additional laboratory and office space was leased. Then the company decided to "double up" on operations by establishing a night research shift rather than increase the physical facilities of the station, believing that it can save laboratory space and equipment by assigning about 25 per cent of the staff regularly to night research, from 4:30 P. M. to midnight, without reducing the volume or quality of results. At the same time, the transfer of some men chemists to ordnance work necessitated the employment of women who have received adequate schooling.

Believed to be one of the largest groups of women chemists in any of the chemical industry's laboratories, the Hercules group of 37, many of whom are 1942 college graduates, represents a ratio of one woman to every six men chemists. With only about 300 girls graduated each June from colleges with degrees in chemistry, they also represent a ratio of one out of every 10 in this year's graduates.

High school girl graduates are working at the Experiment Station as laboratory helpers or in filing and secretarial posts. Hercules also is employing women as chemists, technicians, and helpers in two of its plants, and in at least two of the ordnance works it operates for the War Department.

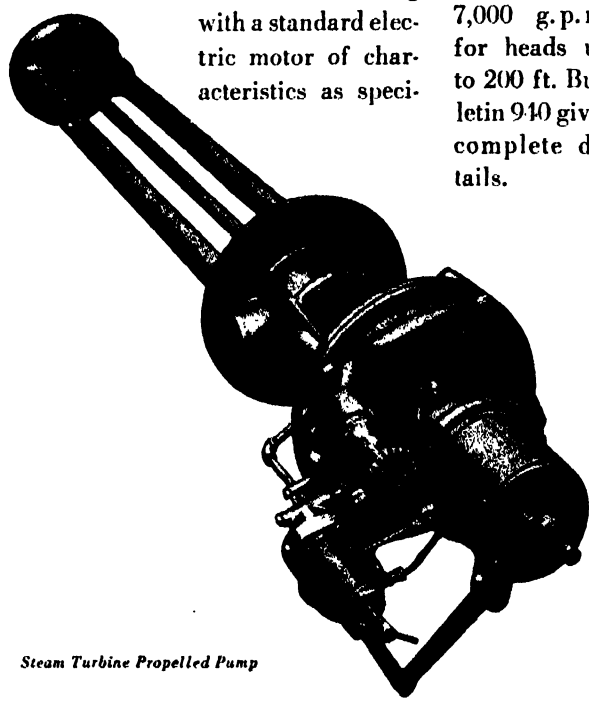
Included among the women chemists at the Hercules Experiment Station is Lura Shorb, who in the last war was one of the few of her sex in the chemical industry. In 1917, she was an analytical chemist at the explosives plant run by Hercules at Kenvil, N. J.; today, she is in charge of the extensive services of the technical library at the research center.

Donna Price, a Cornell graduate; Elizabeth Osman from Bryn Mawr; and Lois Hans, one of the better known women chemical engineers in the specialized field of papermaking, are also on the staff of the Experiment Station.

Structural Members Do Double Duty on this Efficient Pump

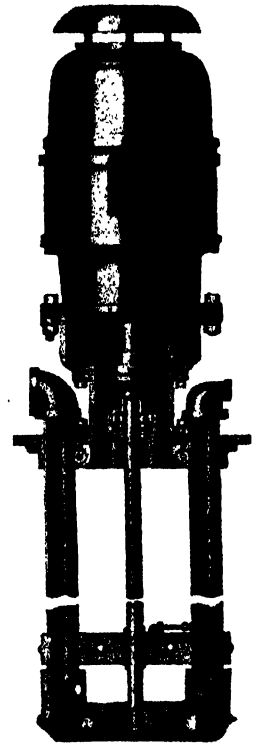
The design of this Amsco-Nagle Pump conserves vital metal, saves unnecessary weight and makes possible its high efficiency. The two structural supports that secure the water end to floor plate also serve another purpose. The strut on the left acts as a lubrication duct conveying lubricant from above the floor plate to the submerged bearing. The strut on the right serves as the discharge pipe.

This pump, a 2". Type "SW", frame 7 unit, has another distinctive design feature—an inverted inlet. This arrangement eliminates gas-binding and causes hydraulic thrust to counterbalance the weight of the revolving parts. The steady bearing at the water end is a sleeve bearing supported in a split yoke and is replaceable without dismantling.



Steam Turbine Propelled Pump

Ordinarily Amsco-Nagle Vertical and Horizontal Shaft Pumps are supplied as shown in the sectional drawing with a standard electric motor of characteristics as specified by purchasers of the pump; but, on the pump pictured (below, left), a Wing Mfg. Co. steam turbine power unit is used.



This pump was built to handle residue from a coke oven by-products chemical still, similar to the residue from petroleum stills.

While water ends can be made of impact and abrasion resistant manganese steel, Amsco Alloy, monel, bronze, and a variety of other metals, depending upon the corrosive or abrasive nature of the material handled, the water end of this particular pump is of ordinary cast iron which was most economical in this case.

War times call for maximum economy and efficiency in all operations and processes and as far as concerns pumping heavily loaded liquids or liquids carrying abrasive material in suspension, Amsco-Nagle Pumps meet the requirements. Available from ¾" to 12"; capacities to 7,000 g.p.m. for heads up to 200 ft. Bulletin 940 gives complete details.

WPB Activities

Agar. Restrictions on transactions in agar, contained in Order M-96, have been removed in the case of sales and deliveries to the Defense Supplies Corporation. Order M-96 froze agar supplies of 50 pounds or more, except for use in preparation of bacteriological media. Amendment 2 will enable the Defense Supplies Corporation to build a stock pile of agar from inventories so frozen.

Carbon Tetrachloride. A temporary surplus of carbon tetrachloride for which storage facilities are inadequate has resulted in easing of restrictions on its use. Amendment 1 to Order M-41 doubles the quantity certain users may consume before September 30. The order previously restricted deliveries to B2 users to 50 per cent of their average monthly consumption for the year ended September 30, 1941.

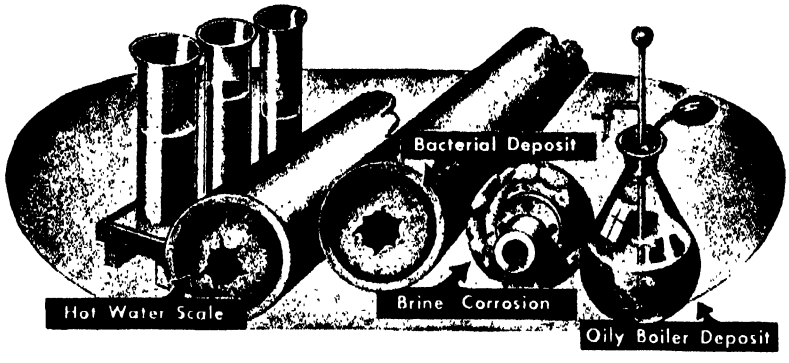
Caustic Soda and Soda Ash. The Director General for Operations has acted to permit unlimited storage by industrial users of caustic soda and soda ash. Increasing supplies of these materials, used in the manufacture of aluminum and other nonferrous metals, glass, soap, textiles, leather, dyes, petroleum, paper, and other products, make it advisable that wide distribution be made now against future demand.

The action adds the two commodities to Schedule A of Order M-161, which removes them from the inventory restrictions of Priorities Regulation 1.

Chlorate Chemicals. A provision that will permit stock piling of chlorate chemicals by large industrial users has been added to the chlorate chemicals order, M-171. Under the new provision, present inventories may be frozen and month-by-month consumption met by allocation. Unrestricted deliveries to any one person in any one month are increased from 10 to 25 pounds.

Chlorinated Rubber. Three changes in the chlorinated rubber order, M-46, have been made in Amendment 2 to the order. The first removes permission to use chlorinated rubber in the manufacture of electrical insulation. Substitutes are available. The second permits the use of chlorinated rubber in the manufacture of core binder cement for use in casting equipment made for the armed services. The third continues the order in effect until revoked. It had been due to expire on July 31.

Ethyl Alcohol used in the manufacture of synthetic rubber is exempted from provisions of the General Maximum Price Regulation in Amendment 18 to Supplementary Regulation 1 of the General Maximum Price Regulation. For the purpose of price flexibility during the formative period of the synthetic rubber industry, numerous chemicals needed in the manufacture of artificial rubber were exempted previously from the general regulation. This amendment applies only to ethyl alcohol covered by the General Maximum Price Regulation when used in the production of synthetic rubber. All sales and deliveries of ethyl alcohol formulas included within the provisions of Revised Price Schedule 28 still remain governed by that measure since no alcohol of these formulas is used in production of synthetic rubber.



Exports to American Republics. A new list of materials for which export orders to the other American republics will be given preference over other orders has been issued as Amendment 2 to General Exports Order M-148. Within the limits of specific allocations made by the Requirements Committee of WPB and to the extent necessary to meet delivery schedules set by the Board of Economic Warfare and WPB, Latin American orders for the critical materials specified will be given preference, regardless of preference ratings on orders which they may displace.

The following products have been added to the list which was announced May 12 and will receive preference during the third quarter of 1942: mercury, platinum, zinc, cotton pulp, cryolite, diamond dies (nonstrategic), mica, belladonna, digitalis, ergot, insulin, ipecac, procaine, bauxite, beryl and beryllium, cadmium (metallic), citric acid, dynamite, naphthalene, and potassium chlorate.

These products which were on the previous list have been removed: tungsten, soda ash, tanning materials (chrome), rubber and rubber products, manila fiber and cordage, light trucks, cranes, hoists, derricks, mechanical and electric household refrigerators, cobalt (oxide), molybdenum wire, caustic soda, tricresyl phosphate, and small electrical heating appliances.

Extension Orders. Three chemicals orders which were due to expire on July 31 have been extended until revoked. The orders are M-27, on the distribution of phenols; M-71, concerning processing and distribution of fats and oils; and M-31, governing deliveries of methyl alcohol.

Machinery. Persons engaged in the freezing, dehydration or fresh packing of

TEST TUBES SAVE WATER TUBES

Haering products and Haering service are directly stepping up war production. They control corrosion in boilers, condensers and engine cooling systems and all water equipment used in gasoline production, munitions, tanks and many other war products.

Our ability to read water and our many glucosate correctives are doing active service in war industries.

Send for booklets on scale and corrosion control, cooling waters, proportioning problems.

Write for sample containers and data forms to give us a complete picture of your problems.

"WE READ WATER"
GENERAL OFFICES: 205 West Wacker Drive
CHICAGO, ILLINOIS

fruits and vegetables are assigned the same preference ratings as canners for material and machinery needed for repair, maintenance, and expansions of their plants in an amendment to Preference Rating Order P-115. The ratings assigned are A-1-a for emergency maintenance or repair; a-1-c for replacement, addition, or expansion; A-1-j for normal maintenance, repair, and operation, all subject to specific limitations.

Mercury. Amendments to Conservation Order M-78 make several additions to both the permitted and prohibited uses of mercury. The new restrictions include the act of redistilling within the meaning of the term "processing," add the manufacture of fireworks and film developing preparations to the list of prohibited uses, and reduce the amount which may be used in the production of cosmetics from 80 to 30 per cent of the amount used during the base period.

Added to the list of general exceptions from the restrictions imposed by the order are deliveries to laboratories for specified purposes, the manufacture of antifouling paint for use on merchant vessels of the United Nations, and the maintenance and repair of industrial control equipment.

Phthalate Plasticizers, used in the manufacture of plastics, synthetic rubber, lacquers, and smokeless powder, have been placed under complete allocation control. Form PD-606 is provided for persons seeking delivery of phthalate plasticizers, and Form PD-607 for monthly reports by producers and distributors. Deliveries to one user of 5 gallons or less of each type of phthalate plasticizers in a month are not restricted, nor are deliveries of 55 gallons of any one type or 110 gallons of different kinds to a single user. The allocation system becomes effective September 1.

Pyridine. Production and distribution of pyridine are put under complete allocation control in Conservation Order M-185. Pyridine is used in the manufacture of the sulfa drugs, of Zelan, a water repellent for tents, coats, gas masks, sleeping bags, etc., and of nicotinic acid. All producers and distributors of pyridine are required to file Form PD-604 on or before the 10th day of each month preceding the month for which authorization for use is desired. In addition, Form PD-605 will have to be filed on or before the 18th day of each month. Users of less than 10 gallons a month are exempt.

Shellac. Civilian use of shellac is practically halted in an amendment to Order M-106 which places all shellac, except for certain specified uses, under complete allocation. The previous order included seedlac in its provisions. By a change in definition, seedlac is removed from the order.

Synthetic Rubber. The War Produc-

DO YOU KNOW

"EVERY INGREDIENT OF NATIONAL IS AMERICAN"

tion Board has approved an increase in its synthetic rubber program from 800,000 to 870,000 tons. The increase, to be obtained with no expenditure of critical materials for construction purposes, is due to advanced engineering in the production of butyl rubber which permits an increase of 70,000 tons in the formerly planned 60,000-ton capacity of plants already under construction. The expanded program is not expected to alter the projected figure of 300 tons of butyl rubber to be produced in 1942. The increase does not change the current picture, and the facts on the rubber situation still indicate that no rubber can be spared for nonessential purposes.

Price of Imported Cresylic Acid Cut

A SUBSTANTIAL reduction in the price of imported cresylic acid has been announced. A specific price measure for this type of cresylic acid—Maximum Price Regulation 192—provides an elastic pricing formula which establishes the ceiling price for sales by importers at approximately $1.10 per gallon. This price, based upon current cost conditions, is from 40 cents to 75 cents under the maximum previously established for most importers by the General Maximum Price Regulation. The new price schedule became effective August 5.

Pilot Plant to Test New Zinc Process

PAVING the way for development of large, untouched reserves of domestic zinc ores, the U. S. Bureau of Mines will establish a $350,000 pilot plant and laboratory to conduct commercial-scale tests of a gas reduction process developed by the bureau for production of the critical metal zinc. The pilot plant, which probably will be built somewhere in the south-central section of the United States, will have an output of 500 pounds of metallic zinc daily. Funds for construction have been provided in the First Supplemental National Defense Appropriation Act, 1943.

Representing a departure in metallurgical processes for treatment of zinc-bearing ores, the bureau's method uses reducing gas in several stages of a reducing cycle from which ore concentrate emerges as high-purity zinc. Experiments indicate that only 5 cubic feet of reducing gas are necessary to produce 1 pound of zinc and that as much as 95 per cent of the zinc can be extracted from the ore by the new process. The scientists have estimated that the amount of fuel required to produce a pound of zinc by using this method is approximately one half of that needed in commercial furnaces which use coal and coke.

FTC Order Names Insecticide Group

TWENTY-SIX manufacturers of insecticides, fungicides, and related products, the Agricultural Insecticide and Fungicide Association, and 11 of its officers and directors have been ordered by the Federal Trade Commission to halt certain practices "having the tendency and effect of restraining and suppressing competition in the sale and distribution of their products". The commission said the association, organized in 1934, had "acted as a clearinghouse for the exchange of statistical, price, and trade information which was submitted to it by the respondent members".

Corporations named in the order, all members of the association, were:

Acme White Lead and Color Works, American Agricultural Chemical Co., American Cyanamid and Chemical Corp., Derris, Inc., George W. Cole & Co., Inc., John Powell & Co., Inc., General Chemical Co., Inc., Stauffer Chemical Co., Inc., Phelps Dodge Refining Corp., Tennessee Corp., American Nicotine Co., Inc., California Spray-Chemical Corp., Chipman Chemical Co., Inc., Hercules Glue Co., Ltd., trading as Colloidal Products Corp., Commercial Chemical Co., Dow Chemical Co., E. I. du Pont de Nemours & Co., Inc., Latimer-Goodwin Chemical Co., Niagara Sprayer and Chemical Co., Inc., Nicotine Production Corp., Sherwin-Williams Co., Inc., Southern Acid & Sulphur Co., Inc., Tobacco By-Products and Chemical Corp., J. W. Woolfolk Co., Ansbacher-Siegel Corp., and J. M. Taylor, E. P. Brown, and E. W. Parker, trading as Taylor Chemical Works, Ltd.

Charges named in the original complaint were dismissed against the Allegheny Chemical Corp., Antiseptic Products Co., Fred L. Lavanburg, and Lucas Kil-Tone Co., all of which have ceased doing business, and the Pittsburgh Plate Glass Co., Corona Chemical Division, which, the commission said, had not cooperated with the other respondents since 1936.

Explosives Instructions Issued

RIGID instructions regarding the storage, handling, and transportation of explosives by the more than 145,000 persons licensed under the Federal Explosives Act have been issued by the Secretary of the Interior Harold L. Ickes. Anyone violating instructions may have his federal license revoked, be refused a renewal of his license, or be prosecuted under the act and thus be subject to a fine of not more than $5,000 or imprisonment for not more than one year or both.

The new instructions provide among other things that explosives must be stored in "substantially constructed and securely locked buildings or in suitable containers" and that they must be protected at all times against theft, loss, or unauthorized use. Specific instructions also are given for construction of various

Few indeed are the chemicals that have uses more widely varied than caustic soda, one of the four-score products on which HOOKER reputation is based.

HOOKER Caustic Soda, to mention but a few of its many uses, helps make the Nation's soaps; degreases bolts, nuts and other machine parts throughout the metal working industry; aids in the manufacture of rayon, petroleum products, paper, reclaimed rubber, textiles, medicinals—and is essential in the production of a large group of other chemicals which, in their turn, further help lick important war jobs.

HOOKER Caustic Soda, one of the original HOOKER products, is widely known for its purity and uniform compliance with specifications. In spite of today's demand for unprecedented quantities, the highest quality standards are being maintained.

And now as always, HOOKER technical specialists are available for consultation on production problems throughout the chemical industries essential to winning the War and the Peace.

2073

types of explosives-storage magazines. Every person licensed to manufacture or store explosives will be required to identify clearly the place where the plant or magazine is located by posting signs reading "Explosives—Keep Off".

New Process Proposed for Alumina Production

PRODUCTION of alumina from low-grade domestic bauxite and from clay, heretofore little used for aluminum metal, has been recommended to the War Production Board by the Advisory Committee on Metals and Minerals of the National Academy of Sciences. Use of a proposed new process by the alumina plants in the country will make it possible to include a substantial quantity of clay with the bauxite feed, so that less bauxite will be needed and the limited domestic reserves conserved. The committee reported on the results of a year's study of possible new sources of alumina from clay, tailings, high-silica bauxite, alunite, kaolin clay, and the like, made at request of WPB.

The committee has found that treatment of the tailings from the Bayer process, containing iron, titanium, and silicon compounds, by a recently developed sintering process will result in the recovery of substantial amounts of alumina. This process will permit the production of alumina from high-silica bauxite as well as from current accumulations of this red mud. Of several proposals to produce alumina directly from clay without the Bayer process, the committee looked with favor on a sintering process known as the modified Pedersen process, and recommends construction of a test plant for the purpose. Continuation and expansion of the current pilot-plant operations around the country, such as those being operated by the U. S. Bureau of Mines and by Kalunite, Inc., in Utah, are urged.

Ordnance Sets Up New Field Offices

GOVERNMENT-OWNED, contractor-operated ammunition factories, producing explosives under direction of the Chief of Ordnance, Services of Supply, had their activities further coordinated August 1 when field directors were appointed in important production centers.

A field director of ammunition plants has been located in St. Louis, Mo., to coordinate and direct activities of the ammunition plants. The Production Section, Small Arms Branch, and the Gage and Gage Facilities Section of the Office of the Chief of Ordnance, now in Washington, has been transferred to Philadelphia, Penna.

"In this manner the administration of ammunition production will be carried directly to the manufacturing plants,"

What Beckman pH Control is Doing to Speed Up America's Production!

MORE production! . . . *Faster!* . . . *Better!* That's the big cry today. And here's what Beckman pH Control is doing—*right now*—to speed up production from plants in industry after industry . . . electroplating airplane parts to producing chemicals, from turning out food products to making paper . . . wherever water or water solutions are used in production processes . . .

SPEEDING PRODUCTION . . .

By Beckman-controlling the pH of their processing operations, many plant operators have been able to step up production rates without costly plant expansion. Example: Metal Plating . . . Beckman pH Control on the plating solutions has permitted faster plating at higher current densities with no sacrifice of smoothness—no peeling—no blistering. *Speeds production of critical airplane, tank, and gun parts!*

CUTTING WASTE . . .

By taking the guesswork out of process solutions, Beckman pH Control is cutting rejects and "mis-runs" to a minimum. Also is preventing "overdosing" and waste of hard-to-get chemicals. Conserves raw materials, cuts production costs, eliminates waste!

IMPROVING QUALITY . . .

Faster production often means sub-standard production . . . *but not with Beckman pH Control.* For in industry after industry Beckman pH Control, by eliminating many "unpredictables" in processing operations, has made possible a consistently better, *more uniform* product!

REDUCING MAINTENANCE . . .

Another major field where Beckman pH Control makes big savings is in reducing costly corrosion of valuable plant equipment. Example: Power . . . Beckman pH controlled feedwaters reduce scale and corrosion on boilers, heat-exchangers, piping, valves, etc. Cuts maintenance and "down time" . . . lengthens life of hard-to-replace equipment!

IF YOU USE WATER or water solutions anywhere in your plant operations . . . in processing, in boiler feedwater, waste disposal—*anywhere* . . . investigate the savings in time, materials, and production costs possible through Beckman pH Control. Our engineers will make recommendations to fit your particular operations.

There's a size and type of BECKMAN pH Equipment for every purpose—for every size plant. All embody advanced features available in no other make or type of pH equipment!

SEND FOR BOOKLET: "What Every Executive Should Know About pH" —a timely, helpful booklet on pH—what it is, how it's used—will gladly be sent on request. Send for yours!

A burst of 40 pounds of white phosphorus, Civilian Defense School activities in Edgewood Arsenal

Major General L. H. Campbell, Jr., Chief of Ordnance, said. By moving these offices out of Washington, General Campbell expects to speed up inspection and acceptance of weapons to be supplied to fighting fronts all over the world. Nearly 70 officers and 150 civilians are to be transferred from the Washington headquarters.

Army Ordnance Establishes Explosive Safety Branch

AN EXPLOSIVE SAFETY BRANCH has been created in the Army Ordnance Department, Services of Supply, with headquarters at 333 North Michigan Ave., Chicago, Ill., to formulate, supervise, and enforce safety measures in munitions plants and establishments where explosive hazards exist. Colonel Francis H. Miles, Jr., Ordnance, is chief of the new branch.

PRODUCTION of Linseed oil during the second quarter of 1942 was 241,015,000 pounds, according to a preliminary report of the U. S. Bureau of the Census.

Most Effective War Use of Physicists Urged

RECOGNIZING that many methods and devices of modern warfare are applications of the science of physics, the American Institute of Physics has issued a statement calling for a wise and effective use of the Nation's trained manpower in this field. The statement, prepared by a War Policy Committee of leading physicists, points out that so many physicists are devoted to vital war work that not enough are left to give training in physics, both in colleges and schools and in special courses set up by the armed services themselves. It is estimated that the military operation of technical devices will require some training in physics for as many as 200,000 men and women within a year. Steps suggested as a partial solution include establishment of government-sponsored teacher training courses, adoption of wise occupational policies by the Selective Service System, provision of financial aid to well-qualified students, and use of physicists in the Army and the Navy only for work requiring their training.

Who Makes It?

SOURCES of supply for following are wanted by the National Registry of Rare Chemicals, Armour Research Foundation, 35 West 33rd St., Chicago, Ill.: Sodium 1-malate, sodium 1-glutamate, blood charcoal, mercuric fluoride, glucose 1-phosphate, hexose 6-phosphate, fructose 1,6-diphosphate, acetyl phosphate, phosphoglyceraldehyde, and guanine.

Earl L. Richardson has recently been added to the Research and Development staff of Colgate-Palmolive-Peet Co. in Jersey City, N. J. Previously he was employed as a research chemist at the Calco Chemical Division of the American Cyanamid Co., Bound Brook, N. J.

Elmer W. Silver, secretary, has been elected treasurer of the Whitehead Metal Products Co., succeeding the late **William L. Rianhard.**

KEEP 'EM FLOWING!

We refer to the vapors being removed from thousands of Condensers and Processing Vessels by Croll-Reynolds Steam Jet Evactors. Production Equipment for this apparatus is being pushed to keep up with what seems to be an ever-increasing demand. Now, even more than ever, we are eager to help the operators of the many thousands of Croll-Reynolds Evactors get the maximum performance from existing equipment.

In some cases vacuum can be increased by merely changing the nozzles. Capacity can often be increased by changing the nozzles and throats or by re-machining them. It is our policy to keep in stock rough castings for throats and suitable materials for nozzles which can be promptly machined for individual conditions on prevailing priorities. Complete new Evactors for vacuum to a small fraction of 1 mm. are still being made subject to crowded conditions on ordnance equipment.

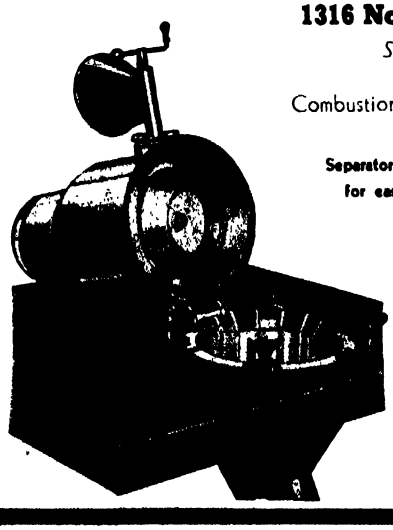
RAYMOND *Laboratory Separator*

Test Separations



ON FINE PARTICLE SIZE PRODUCTS

such as chemicals, pigments, clays, talc, insecticides, cement, ceramic materials and powdered foods, can be accomplished easily and accurately with the Raymond Laboratory Separator.

1. It operates on the same principle as the large Raymond Mechanical Air Separators, and gives the same resultant material.
2. Fineness is regulated by means of a set of interchangeable whizzers and fans furnished with the machine.
3. Separator is easy to take apart for cleaning or adjustment. See illustration.
4. Complete motor-driven unit comes mounted on a metal base with sockets for pipe legs.
5. Separator will handle any fine, dry material in small amounts as required for testing purposes.

Illinois Tech Graduates Women in Chemistry War Course

ILLINOIS INSTITUTE OF TECHNOLOGY graduated 24 women in an industrial chemistry war-training course on August 22. The course is part of the institute's Engineering, Science and Management War Training program, and the women are going into war work immediately. Illinois Tech was the first school in the Nation to offer such courses training women for technical war jobs. Other sections in industrial chemistry will be opened later, as well as courses in ordnance inspection and industrial drafting—the other courses which are offered in the program.

CHEMISTRY AND TECHNOLOGY OF
RUBBER

Edited by: C. C. Davis and John T. Blake

Published under the Auspices of the Rubber Division of the American Chemical Society

NOTE: The prospect of a severe and long-continued shortage of rubber makes it more necessary than ever for the industrial consumers of rubber to understand its properties. Such knowledge will greatly aid them in determining what substitute materials can be used to greatest advantage.

This book is designed for all those connected with the rubber industry, whether research workers, analysts, compounders or development engineers. It is an authoritative reference work for both the theorist and the practical man.

Outside the rubber industry, this Monograph will prove invaluable to students, and to research and development men in numerous industries which supply raw materials for the manufacture of rubber goods. Engineers in the petroleum and chemical industries, on whom the responsibility of stepping up synthetic rubber production will now fall, will be greatly helped by the chapters on the physics of rubber and on substitute rubbers. Finally, this book will be useful to large-scale consumers of rubber: to textile plants, which now employ latex extensively; to the footwear and clothing industries; to automotive and other mechanical engineers; and to industrial maintenance engineers everywhere, who have become dependent on mechanical rubber goods for factory and field installations.

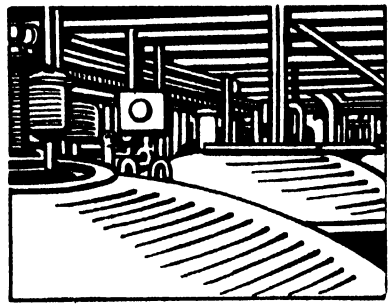
A. C. S. Monograph No. 74 941 Pages Profusely Illustrated Price $15.00

Reinhold Publishing Corporation, 330 W. 42nd St., New York

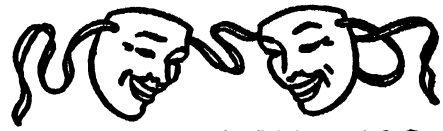
Danish Glass Works Resumes Operations

RESUMPTION of operations by the glass works at Kersor, Denmark, after two years' idleness because of lack of coal, is reported officially from Denmark.

The plant has a capacity to produce a considerable part of that country's requirement, approximately 6,000 tons annually, and has been put back into activity because stocks have become exhausted and the demand has risen. Some 7,000 tons of coal have been assigned to the factory. Stocks of other raw materials are said to be adequate.



It will be several months before the new Danish glass is on the market, it is stated, as the ovens must be fired, and the initial product is likely to be defective.



Recovery of Steel Plant By-Products Planned in Brazil

THE Brazilian Government expects to recover large quantities of chemical by-products from operation of a steel plant being constructed in that country. The plant should be in full operation by the end of 1943. Estimated by-products will be tar, 15,200,000 liters annually; benzene 3,880,000 liters; toluene, 896,000 liters; solvent naphtha, 93,000 liters; ammonium sulfate 5,200 tons.

Resistance to Heat, Fatigue Increased in New Alloys

FOUR aluminum alloys of beryllium, said to retain their high tensile strength even when subjected to the high temperatures encountered in the newest airplane engines, have been developed by the Aluminum Co. of America, New Kensington, Penna. The alloys are revealed in Patents 2,286,624 to 2,286,627, granted to Lewis W. Kempf and Walter A. Dean of Lakewood, Ohio. It is claimed that the new alloys are not weakened by temperatures as high as 600° F.

EMANATIONS

Arginine

(To be sung to the tune of "Tangerine")

ARGININE—it's got guanidine.
In the liver it gives rise to ornithine.
Arginine—it yields putrescine.
Also known as tetra methylene diamine.
There are those who say arginine,
Hasn't got a lot to do with creatine.
Now I don't intend to be mean—
But I'll say this for creatine,
It's amidines from arginine.

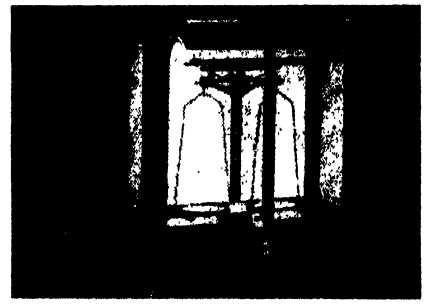
"Dry" Bans Alcohol Tires

A TELLING point against alcoholic rubber is pointed out by the *New York Times* in quoting a "letter to the editor" from an ardent prohibitionist of Nashville, Tenn. He said, "Fellow prohibitionists, let us refuse to use this product of an evil industry in any way, shape, form, or fashion, as we have in the past. We had rather walk than ride on tires made of alcohol."



declare WAR ON WASTE with NUCHAR active CARBON

A large Eastern manufacturer for years had thrown away daily great quantities of process liquors because of contamination. As these liquors contained a mixture of two valuable acids, the company investigated every possible method for recovering these vital war chemicals. Even in normal times this problem would be important because of the value of the acids going to waste; and now it is even more acute because of the shortage of these acids.

After much research the company devised a method which oddly enough is very simple. A day's supply of this waste liquor (containing an equivalent of 8000 pounds of mixed acids) is accumulated in a large vat and treated with approximately 20 pounds of NUCHAR Active Carbon. This is allowed to settle for several hours and then the clear, colorless, supernatant liquid is run through a small polishing press and is ready for re-use. By this process NUCHAR saves valuable, vital acids that would otherwise be wasted.

NUCHAR INDUSTRIAL CHEMICAL SALES
NEW YORK, N.Y.

FLUORESCENT BALANCE LAMP

Directed Frontal Illumination

Mounted at the front of the balance case, the *parabolic reflector* directs all light over the entire working area of the balance.

The lamp is rigidly supported by a clamp which cannot mar the case finish, can be attached to all makes and styles of balances, and when in position permits free movement of the sliding door. The weight of the reflector is greatly reduced by making a separate unit of the auxiliary so that it can be placed on the laboratory bench close to the balance.

The G. E. fluorescent tube supplied with the lamp produces approximately 750 hours of glareless, efficient light of daylight quality.

S-3820 Balance Lamp, Fluorescent, Sargent. Complete with No. S-44285, T-5 fluorescent tube $11.50

S-44285 Fluorescent Tube, T-5, 8 watts. For replacement. Each $1.10

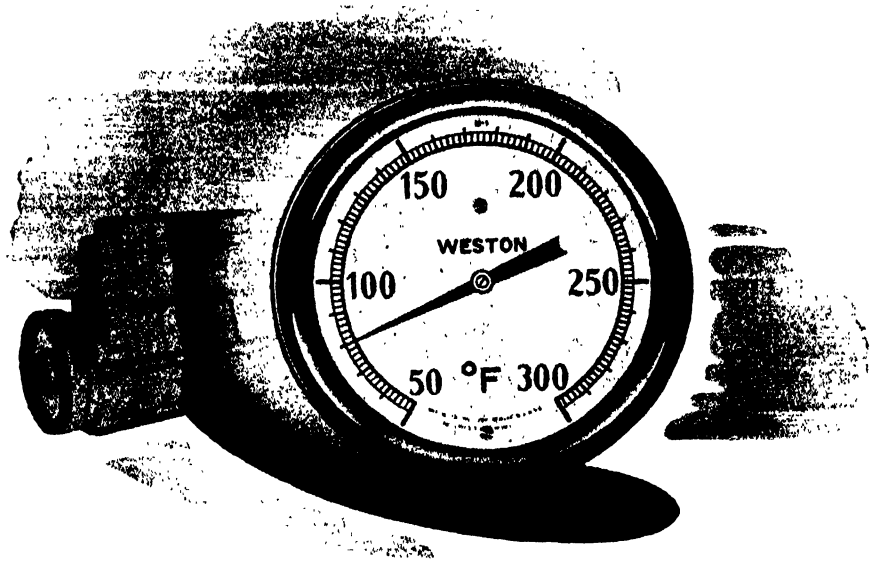
War Gases. *Morris B. Jacobs.* 1st ed. 180 pages. Interscience Publishers, Inc., 215 Fourth Ave., New York, N.Y., 1942. Price, $3.00.

THIS book contains a collection of classified information on the war gases and other toxic gases which, under certain conditions, might have some war value. The book is confined to practical information such as is needed in civilian defense, and is addressed primarily to the gas identification officer, the war gas chemist, the decontamination officer, the health officer, and the air-raid warden. The principal subjects covered are the physical characteristics and physiological effects of the war gases, their effects on various materials including food and water, their detection, identification, and analysis, and methods of decontamination.

The author has made a careful study of contemporaneous literature on chemical warfare, including official publications of the United States and Great Britain. Many methods for doing the same thing are described, and the inexperienced air-raid worker will be embarrassed by this wealth of information unless the book has been carefully studied beforehand and some of the methods tried. However, all the methods described are well sponsored and appear to have merit, and the practical man would not go far astray in using any of them.

There are few positive errors in the book. Chemical warfare experts will not entirely agree with some of the definitions of terms on page 4. Lethal concentrations are not determined on man as suggested on page 6. Mustard gas and not phosgene was the most effective chemical war agent of 1914–18 (page 16).

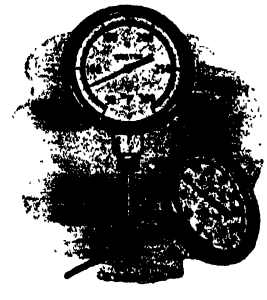
The material presented is excellently organized and well indexed. The type is clear and legible. The binding and press work are good. This book should find wide circulation among those who are interested in the subject of the war gases and what to do about them if chemical warfare should be brought to our shores.



A. L. KIBLER

An Introduction to Electrochemistry. *Samuel Glasstone.* 557 pages. D. Van Nostrand Co., Inc., 250 Fourth Ave. New York, N. Y., 1942. Price, $5.00.

IN COMMON with most textbooks and courses in electrochemistry, many of the chapters deal with the constitution of solutions, acids and bases, neutralisation, and amphoteric electrolytes, with which every electrochemist should be familiar. The treatment of these subjects is thorough, clear, and modern.



In his preface the author recognizes the importance of "phenomena at active electrodes" and devotes about 20 per cent of the volume to these topics. The presentation of polarization and overvoltage is much more complete and modern than in comparable texts. The brief space devoted to electrodeposition has prevented an adequate treatment of some important topics. For example (page 485) the impression is given that conductivity per se affects the throwing power, although the

THE ALL-METAL THERMOMETER

stands shaking up...without breaking down

The reason why the WESTON Thermometer can "take it" is found in its simplified, all-metal construction. There is but one moving element, and even that part is made of enduring metal. There is no gas or liquids . . . no capillary . . . no fragile members. Thus the WESTON not only resists ordinary breakage but it also stands up in applications where vibration is present . . . maintaining its high initial accuracy (within 1% over entire scale) over far longer periods. Available in types, sizes, ranges and stem lengths for Diesel and many industrial applications. Descriptive literature available on request. Weston Electrical Instrument Corporation, 660 Frelinghuysen Avenue, Newark, N. J.

WESTON all-metal temperature gauges are available in both angle and straight stem types; scale diameters up to 6"; stem lengths from 2" to 24".

WESTON *All-Metal* TEMPERATURE GAUGES

theory of the potential is based on the principle that, in the absence of polarisation, current distribution is solely a geometrical problem. Reference might have been made to the effect of cathode efficiency on throwing power, especially in chromium plating. In the valuable discussion of diffusion films, mention might have been made of the recent measurements by A. Brenner of their actual thickness, which was found to be only about one half of that computed by Glasstone and others. The presentation of electrokinetic phenomena is timely and helpful.

Progress in science is advanced by the acceptance of certain conventions that may be as arbitrary as driving on the right side of the road. It would be helpful if authors, especially of textbooks, would follow such conventions as the American Standard Definitions of Electrical Terms, e. g., "conductivity" and "resistivity" for the properties of a material, rather than "specific conductance" and "specific resistance". The system used by the author for signs of potentials is that used in most texts on physical chemistry, but is in conflict with the convention of most technical societies and leads to confusion in the treatment of polarization.

In the preface the author states that "the present book is more suited to the needs of students of physical chemistry, and those chemists, physicists, and physiologists whose work brings them in contact with a variety of electrochemical problems..... The book should also serve as an introductory text for those who intend to specialize in either the theoretical or practical applications of electrochemistry." The author has accomplished this goal so well that we hope some day he will write a book more largely devoted to the needs of industrial electrochemists, who are especially concerned with the departures from equilibrium conditions.

WILLIAM BLUM

Die Methoden der Fermentforschung. *E. Bamann* and *K. Myrbäck.* 3,321 pages. Georg Thieme Verlag, Leipsig, 1940 and 1941.

THIS work, written in German, contains 204 contributions by 131 prominent chemists and biologists from many countries. It was planned before the present war and appeared in nine consecutive sections during 1940 and 1941. It is the most unique book that has ever been published in this rapidly expanding field of chemistry. In spite of its size, theoretical discussions are limited to practical applications only. A considerable part of the book deals with the preparation and description of the substrates such as the synthetic esters, natural glycerides (olive oil, ricinus oil, soya oil), tannins, chlorophylls, numerous organic phosphoric acid esters, lipoids, carbohydrates, nucleic acids, proteins, and the derivatives of all these compounds as well as other organic substances important in enzyme chemistry.

An interesting chapter by Hirst and Peat deals with the synthesis and physiology of ascorbic acid. Barrenscheen and Pany are the authors of a chapter covering the preparation of the phosphorus-free intermediates of sugar metabolism (glycerol aldehyde, dioxyaceton, glyceric acid, pyruvic acid, methyl glyoxal, etc.), whereas Robison and Macfarlane describe the methods for the preparation of those intermediates that contain phosphorus (esters of sugars and of glycerol, and related compounds).

Highly instructive chapters are included on carbon dioxide assimilation in plants (Steiner), and in bacteria (Engel), and a chapter on nitrogen metabolism (Laine and Virtanen).

A large number of physical methods, such as the polarimetric, refractometric, spectrophotometric, colorimetric, röntgenologic, polarographic, magnetic, nephelometric, viscosimetric, and manometric, are described in great detail.

Most chemical procedures employed in the estimation of enzyme activities are included in the book. The function of enzymes in malting and brewing is reviewed by Haehn. Other chapters deal with the enzymes of flour and honey, the function of enzymes in the fat, dairy, fruit juice, textile, leather, and pharmaceutical industries. The use of enzyme tests in medical diagnosis is also discussed.

There is no subject index. There is, however, a bibliography of 7,908 references.

This work is an excellent source book of methods for the preparation of natural and synthetic substrates, of enzymes, and of procedures used in testing enzyme activity. It will be of great help to those confronted with enzyme problems.

HENRY TAUBER

Micromethods of Quantitative Organic Analysis. *Joseph B. Niederl* and *Victor Niederl.* 2nd ed. 347 pages. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1942. Price, $3.50.

IN THE preface the authors state that reviews of their first edition have encouraged them to continue the same mode of presentation. Microchemical methods are now introduced in the curricula of almost all educational chemical institutions, and the uniformity of presentation in the first edition was an instrumental factor in the adoption of these one-time research methods into industrial practice. The influence exerted by the first edition among those interested in this phase of chemical analytical methods brought about the standardization of many procedures and enabled younger men employed in industry to become more familiar with the practical application of organic analytical micromethods.

The second edition has outgrown the simple term, "laboratory manual", and can best be called a "handbook on organic microanalysis". The literature of the entire subject is well covered, and the authors' teaching experience guides elegantly every step of the various pro-

Beyond the Flyleaf

CONTINUED FROM PAGE 1072

cedures. It helps the pupil and the instructor with less experience over the pitfalls and difficulties encountered in courses dealing with experimental methods.

One of our most active industrial microchemists has said that the progress of the research laboratory depends upon the quality and experience of its microanalyst. It is hoped that such an axiom will induce the authors, while preparing the third edition, to keep in mind a plan for enlarging the second edition to cover the entire subject of micromethods by a guarded, integrated, and coordinated system. Thus the beginner would have a more comprehensive text on principles of tested methods when entering upon his professional career; the one-time textbook would then become a more useful companion in everyday practice, and many of the published refinements of methods would be better understood by the practical man using microchemical analysis.

No book in the English language is better suited for introducing micromethods of organic analysis than the Niederl and Niederl already classical treatise. But, to maintain this high plane of presentation, the authors are urged to include in their forthcoming next edition a section on the historic aspects of microchemistry, especially as applied to America. It might be worthwhile to include in this future handbook of micromethods the more recent developments of diffusion analysis of Conway and Kirk. Also more emphasis should be given manometric micromethods. The chapter on qualitative organic analysis, now spanning only two pages, should be enlarged at least a hundred fold to cover the present status of the science and art of coordinating micromethods in the identification scheme of organic compounds. The isothermic method of molecular weight determination should also have been more comprehensively stressed.

The "balance" section would have gained in value if the various types of balances found on the American market were fully illustrated and explained as to their working mechanism, care, cleaning, and simple repair.

The chapter on Other Methods could have been enlarged and in the next edition should be given appropriate space. The inclusion of calculation tables was timely, especially since most American chemists are not acquainted with Kuesler-Thiel for the easily available nitrogen factors on pressure and temperature. That dry ice has replaced the Kipp generator is worth mentioning, even though the proper filling of a Kipp generator has a pedagogic value in thed evelopment of a microanalyst.

The section on Other Elements should also have been enlarged, especially since industry has begun to use micromethods as a tool in trouble-shooting for the pilot and production plant.

The book is a most necessary instrument for every chemist, and particularly for those who have made the study of microchemical methods their special field. Since each edition is a product of its time, the microchemically interested professional worker will give himself a professional treat if he will use the old, present, and forthcoming editions of microchemical methods as an interesting record keeper of his work.

EUGENE W. SCHOEFFEL

Convection Investigations. IV. A Contribution to the Theory of Systematic Extraction and Other Related Convection Problems. *Sverre Stene.* 170 pages. Document 1641. Report from Statens Institutt for Folkehelsa, Oslo, Norway. American Documentation Institute, 1719 N St., N. W., Washington, D. C. Microfilm, $1.90; photoprints, $17.

THIS study arose in the development of an extraction method to replace precipitation in a separation process for analytical purposes. It was found possible and very useful to apply mathematical methods of probability and statistics, beginning with the application of the binomial theorem. The decided success of this approach led to an organized study of discontinuous extraction and related processes in general with resulting mathematical systems.

All the developments assume sufficiently dilute solutions so that the distribution coefficient may be taken as constant. Many types of problems are treated. For example, in Chapter I—Discontinuous Extraction with a Quiescent Phase—the solute is considered as being introduced (a) once, (b) with every volume of raffinate phase, and (c) with m portions of the raffinate phase followed with n portions of pure raffinate phase; each of these cases is treated for the raffinate phases leaving the system and not leaving. Other problems are indicated by further chapter headings: II. Semicontinuous Extraction with a Quiescent Phase; III. Discontinuous Countercurrent Extraction; IV. Semicontinuous Countercurrent Extraction; and V. Principles of Separation. Applications are suggested to problems in adsorption and in pollution studies.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Colloidal Graphite. An 8-page folder on natural colloidal graphite gives a brief summary of its uses in lubrication. *Folder CEN.* NASSAU LABORATORIES, Hackensack, N. J.

Water Handbook. This publication well deserves the title handbook. It not only discusses chemical analysis, but deals with the correct interpretation of these analyses. In the first section 25 different methods of water analyses are discussed at length with procedures and calculations. Such water analyses as hardness, alkalinity, phosphate, sulfite, turbidity, oil, calcium, specific conductance, etc., are covered. With but one exception, all tests are simple accurate determinations requiring little or no previous chemical background. The second section of the book is devoted to interpretations of the tests and their application to plant control. Included here are discussions of such subjects as carbonate and noncarbonate hardness, pH control, steam purity, intercrystalline cracking, corrosion, and many others. Scattered throughout the Water Handbook are 16 useful technical graphs and 15 illustrations of different pieces of testing equipment. *Water Handbook CEN.* W. H. & L. D. BETZ, Frankford, Philadelphia, Penna.

Water Purification Unit. These units are marketed under the name Ster Ozone and use ozone as the purifying element. The manufacturers point out that the machines producing ozone and purifying water are fully automatic in their operation at all rated capacities. This unit is said to filter, sterilize, control taste and odor, and reduce color in the water treated. The authors have included technical data, flow sheet, and specifications of their unit. *Model "B" Water Purification Unit Publication CEN.* TECHNICRAFT ENGINEERING CO., 5610 South Soto St., Los Angeles, Calif.

Hard Surfacing for Metals

METALS that are simply worn away during manufacturing processes are usually nonreclaimable. They are lost to the war effort and must be replaced. Of equal importance is the loss of efficiency when parts become badly worn. Worn knives can be recovered, however, by cutting off the stub blades, welding on new low-carbon steel blades, and hard-surfacing with Colmonoy No. 6, a product of Wall-Colmonoy Corp., Buhl Building, Detroit, Mich. This process results in the replacement of 24 pounds of high alloy steel by approximately 5 pounds of low-carbon steel and 1.5 pounds of Colmonoy No. 6.

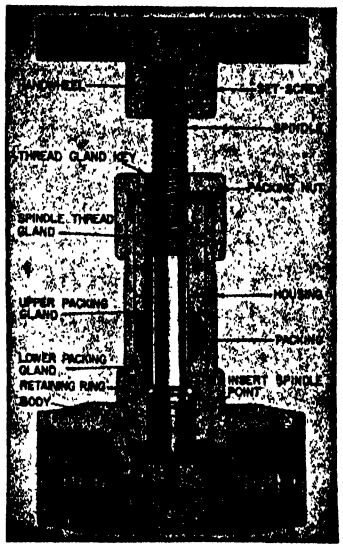
Pyralin Packages for Drills

ABRASIVE drills used in the manufacture of military equipment are being shipped and stored packaged in transparent strips fabricated of Pyralin cellulose nitrate plastic. The packages are made for the Norton Co., Worcester, Mass., by Boutwell, Owens & Co., Leominster, Mass., from Pyralin produced by the Plastics Department of the du Pont company, Wilmington, Del.

Blacklight Lamp

A COMPLETE new line of Mineralight blacklight lamps for Scheelite prospectors and miners is announced by Ultra-Violet Products, Inc., 5205 Santa Monica Blvd., Los Angeles, Calif. Mineralight models include a wide variety, from all sizes of portables for general utility to larger types for mine installations to speed up sorting and grading of ore.

OK



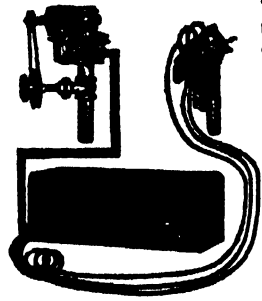
Hoke Corrosion Resistant Needle Valves

Quality Performance

Low Cost

Long Life

An alloy bar stock valve which combines the well-known reliability of the line of HOKE needle valves with initial low cost and economy due to long life. Its distinctive features warrant immediate investigation.



Available in 18-8 and molybdenum stainless steel, nickel and monel.

Bulletin N-34 gives further details.

HOKE, Inc. 585-587 EAGLE AVE., NEW YORK

DENSITY CONTROLLER for PULPS

The Masseo-Adams Density Controller, first used in ore classifiers, now has many applications in non-metallic and chemical plants—including potash and phosphate plants, washing coal, etc. Maintains *visual* control of density by motor-operated regulation of dilutant supply valve. Also available with standard chart recorder or with arm and weights for sink and float process. Widely optional location. *In writing, please describe your problem.*

OVER ONE THOUSAND

SCHAFFER POIDOMETERS

Designed and Built to Serve Industry

with **SPEED ECONOMY PRECISION**

In hundreds of plants throughout the world the Schaffer Poidometer has displaced the old rule-of-thumb method of proportioning raw and finished materials.

In every instance the change has resulted in greater production, assured uniformity of product and important economy.

Schaffer Poidometers are built to stand hard, continuous service. The increased tempo caused by the war emergency has further emphasized their ability to take it.

But even so, it will pay you especially during this period of high pressure production to check over your Poidometer occasionally and keep it in good condition.

MANUFACTURE OF SODA

Second Edition - Revised and Enlarged
by Te-Pang Hou, Ph.D.
A. C. S. Monograph No. 65

THE PRESENT acute shortage of soda ash and the consequent rapid expansion of existing plant facilities make the publication of this volume an event of the first importance not only to the soda industry itself, but to others closely related to it. New plants will be brought into production, older ones enlarged, and every effort will be made to attain maximum operating efficiency from all. It is in this connection that this book will be of particular value, for it constantly stresses the importance of efficiency, and explains precisely the best methods of attaining it.

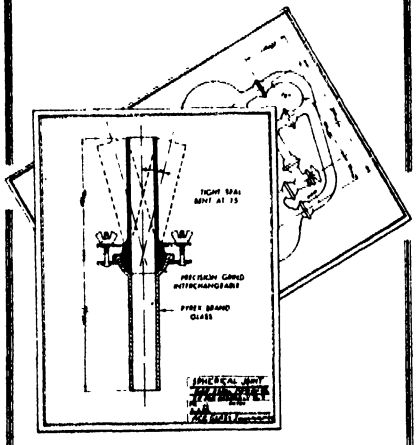

TABLE OF CONTENTS

Introduction. Historical Survey of Alkali Industry
Natural Soda
History of Ammonia Soda Process
Preparation of Brine: Rock Salt and Sea Salt
Purification of Brine
Burning of Limestone
Ammoniation of Saturated Brine
Carbonation of Ammoniated Brine
Working of Carbonating Towers
Filtration of Crude Sodium Bicarbonate (Ammonia Soda)
Composition of Mother Liquor From Carbonating Towers
Phase Rule in Tower Reactions
Decomposition of Sodium Bicarbonate by Calcination
Recovery of Ammonia—Efficiency of Operation in Ammonia Still
By-Products From Distiller Waste
Allied Products of Ammonia Soda Industry
Position of Ammonia Soda Industry
Manufacture of Refined Sodium Bicarbonate
Manufacture of Caustic Soda
Manufacture of Electrolytic Caustic
Wet Calcination of Sodium Bicarbonate
Generation of Power for Ammonia Soda Plants
Boiler Operation and Conditioning of Boiler Feed and Cooling Water
Special Requirements of Ammonia Soda Industry
Control in Ammonia Soda Process
Losses and Consumption of Raw Materials in Ammonia Soda Process
Modifications and New Developments
Chemical Analyses and Tests
Behavior of Soda Ash in Storage
Layout, Design and Location of Ammonia Soda Plant
Centrifugal Pumps Applied to Ammonia Soda Industry
Appendix, Index

590 Pages *182 Tables* *149 Illustrations* *Price $9.50*

For your
PILOT PLANT
or
LABORATORY
use
A C E
SPHERICAL JOINTS
U. S. Pat. No. 2,190,220

Made to ACE specifications, these spherical joints will meet your performance specifications.

They permit considerable angle changes without the need for complicated adjusting devices.

They eliminate breakage of equipment and joint leakage resulting from inaccurate alignment.

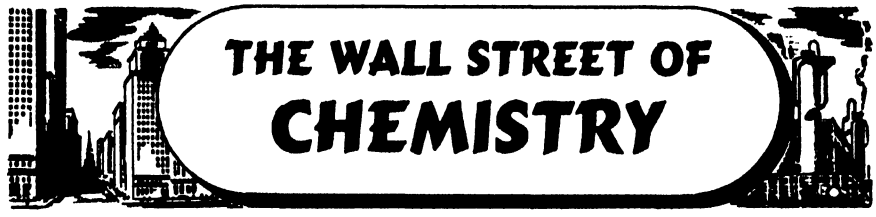
It's easy to install spherical jointed equipment, too. Just approximate your locations, slide the sections together and clamp them. The ACE clamp connects the members simply and effectively.

For final adjustment, align the parts to desired positions and tighten the clamps firmly.

Write for the Ace General Catalog 40 which includes a wide selection of spherical jointed apparatus.

ACE GLASS INCORPORATED
VINELAND, N. J.

Business Statistics



We are indebted to the Manufacturing Chemists' Association, 608 Woodward Bldg. Washington, D. C., for the following figures showing business conditions.

Monthly Statistical Report on Business Conditions

	Seasonally Adjusted			Without Adjustment		
	June 1948	May 1948	June 1941	June 1948	May 1948	June 1941
(Base 1935–39 = 100)

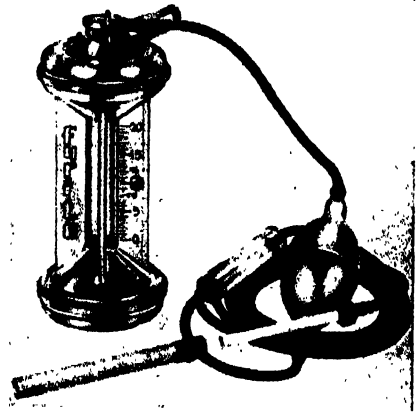
Photoelectric Reflection Meters

THE photoelectric reflection meters recently put on the market by the Photovolt Corp., 95 Madison Ave., New York, N. Y., are designed for measuring the reflectance and color of solid surfaces, fabrics, pastes, powders, and opaque liquids. They are provided with a search unit which is placed on the surface to be measured so that the test specimen need not be inserted into the instrument. This is said to offer the advantage that samples can be measured in rapid succession, that the sample may be of any size, and that the operator can easily select that part of the surface on which he wishes to take readings.

The search unit is connected to the instrument proper by a flexible cable and comprises the light source and the photocell. Model 600 is operated from two dry-cell batteries which are housed in the instrument casing. Model 610 operates on 105–103 volt, 50–60 cycle alternating current. Model 600 is recommended when general reflectance is to be measured and when the instrument is to be taken to places where current is not readily available. Model 610 is usable with more selective color filters, has higher sensitivity, and registers dispersed reflection without responding to specular gloss.

Micro pH Testing Set

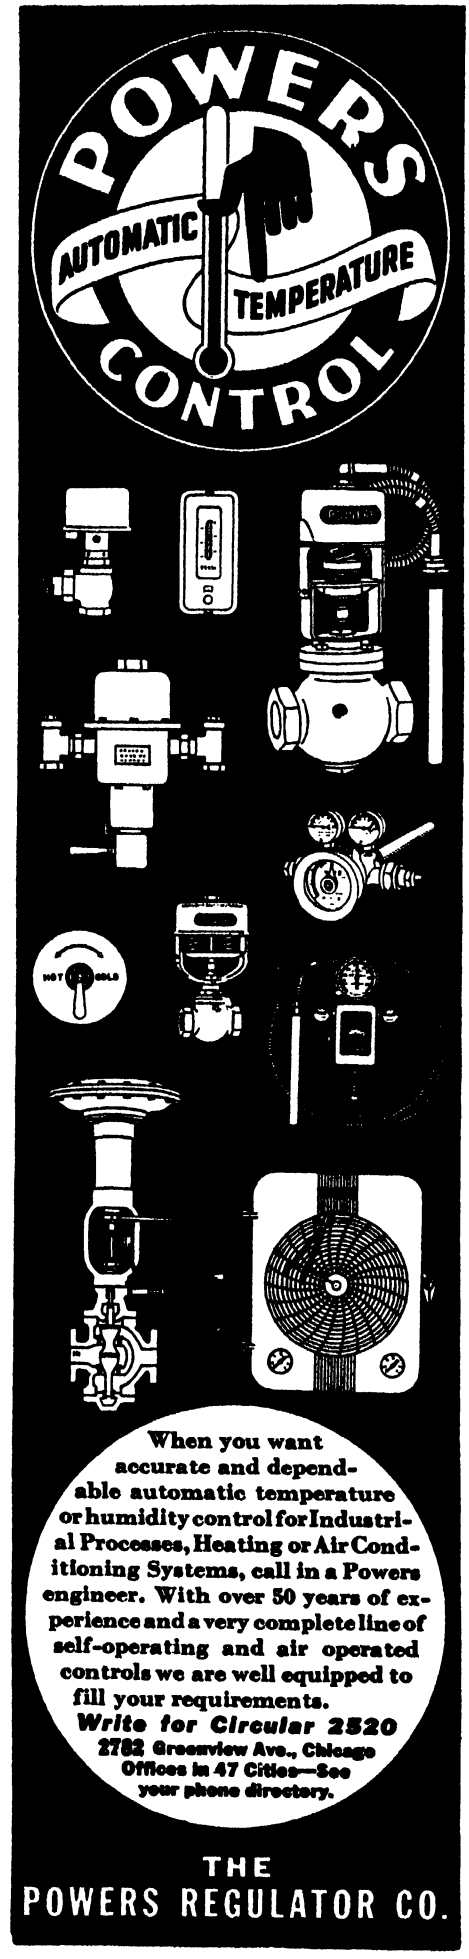


A NEW set with facilities never before offered in the colorimetric system for pH determinations has been announced by the LaMotte Chemical Products Co. of Towson, Baltimore, Md. It is said to require less than 0.5 ml. of the sample to make the determination and to be accurate to ±0.1 of a pH. Turbidity and color in the sample do not interfere with the pH determination, and the actual determination can be made in one minute or less. The standard set covers the pH range of 5.2 to 8.6 and is available in a compact case which includes all the necessary glassware, indicators, and full instructions for making the test.

EFFECTIVE August 2, the new address of the Pittsburgh branch of the York Ice Machinery Corp. became the Hostetter Building, 7 Ferry St., Pittsburgh, Penna.

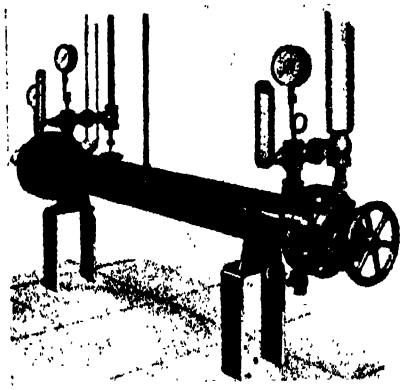
Rip-Cord Bag Closure

THE rip-cord closure developed by Bemis Bag Co., St. Louis, Mo., is a new method of closing cotton and burlap bags. The rip-cord is sewn into the closure of the bag with a regular two-thread bag closing machine. A quick jerk of the rip-cord opens the bag instantly, without tearing or damaging it. Ten rip-cord closed bags can be piled on a hand truck, whereas only eight tied top bags can be loaded on the same size truck. Thus 20 per cent fewer trips from warehouse to freight car are required. Since the bags are more compact, warehouse storage space is saved. The new closure permits use of bags two inches smaller than with wire ties, thus providing an economy in bag costs. The bags can be opened and closed innumerable times without injury, helping the conservation program.



Portable Carbon Dioxide Analyzer

FUEL waste in a power plant or industrial heating furnace can be quickly detected with the Fyrite CO_2 Analyzer, according to the Bacharach Industrial Instrument Co., 7000 Bennett St., Pittsburgh, Penna. The analyzer is a portable instrument that is conveniently held in the hand while analysis is made. A complete carbon dioxide analysis can be made in 40 seconds. Descriptive Bulletin 330 can be obtained from the company.



Improved General-Purpose Durez Plastic

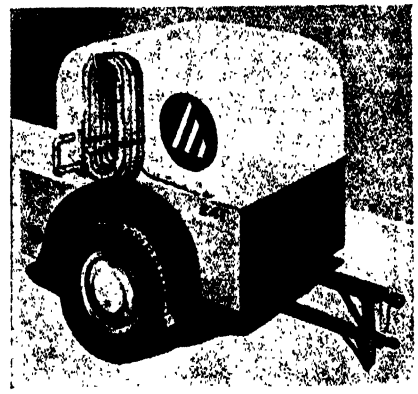
DUREZ 11540, a general-purpose phenolic molding compound, is said by Durez Plastics & Chemicals, Inc., North Tonawanda, N. Y., to have been made adaptable to many new uses through a minor revision in its formulation. It has already been adopted for several war production parts requiring military approval. Durez 11540 has slightly higher impact strength and greater water resistance than former top-grade general-purpose materials. It is said to deliver excellent surface finish. Field communication equipment which must withstand

hard usage as well as instrument cases, housings, and parts are molded of this material.

Self-Cleaning Tubular Heat Exchanger

THE Davis Engineering Corp., 1064 East Grand St., Elizabeth, N. J., has developed the Paracoil self-cleaning tubular heat exchanger. The exchanger is said to eliminate the necessity of manually or chemically cleaning the apparatus. A few turns of the hand wheel while the heat exchanger is in operation restores the surface in contact with the medium being heated or cooled to its original clean condition. The apparatus is suitable for liquids of a viscous nature containing organic or inorganic substances. It can be supplied in various commercial sizes and of materials to resist corrosive action. There is no internal mechanism to get out of order or require replacement due to normal wear. If replacement of the heating surface should be necessary, a new tube bundle can be supplied and installed.

New Wrapping Material for Armaments



TRADITIONAL protector against rust-inducing moisture during the fabrication and shipping of ammunition, guns, range-finders, tanks, planes, and spare parts has been a layer of thick grease, but to save valuable man hours otherwise spent in cleaning operations to remove the grease, a number of plants engaged on war equipment work are now using a new tough, moistureproof wrapping material. The wrapper was developed by the Dearborn Chemical Co., Chicago, and comes in several types and thicknesses.

This No-Ox-Idized wrapper is being used or tested by some of the largest armament manufacturers on a variety of articles, including rifles, airplane propellors, aircraft guns, machine guns, ammunition, carburetors, bearings, gears, regular parts on way to assembly point, spare parts shipped to zones of action, machine tools, and magnetos. The finished part or article may be thoroughly cleaned of dirt and machining oils at the point of production. It may then be wrapped in the cellulose material with a light coating of oil which in many cases need not be removed, or a lump of moisture-absorbing silica gel placed inside the wrapping.

Auxiliary Water Purifier and Fire-Fighting Apparatus

A SELF-CONTAINED, trailer-type water-purification unit that serves as emergency fire-fighting apparatus has been developed by the Technicraft Engineering Co., 5610 South Soto St., Los Angeles, Calif. Operation of the unit, called the Sterozone Hydrovan, makes it possible to purify water for drinking regardless of the length of time it has been in storage. No chlorine or other chemicals are used. Ozone, generated within the unit oxidizes bacterial contamination within a very few minutes and provides pure drinking water. Water can be purified at the rate of 20 gallons per minute.

The Hydrovan is turned into a high-pressure fire-fighting engine by a simple clutch to cut out the Sterozone purification unit and deliver water at 200 pounds' pressure through the 2.5-inch hose.

The unit is mounted on a two-wheeled trailer. Equipped with 50 feet of 4.5-inch intake hose and 400 feet of 2.5-inch fire-fighting hose, the Hydrovan permits operation over nearly a 500-foot range from water storage to fire location. The enclosed gasoline engine drives the electric generator and the fire pump.

Electronic Plastics Thickness Tester

THE Model M-25 Carson electronic micrometer is designed for uniform thickness testing of all types of plastics and similar compressible materials. In this portable instrument highly sensitive electronic tubes replace the operator's judgment and skill. Thickness is read as with a hand micrometer. The instrument operates from any 110-volt 60-cycle circuit. A development of Instrument Specialties Co., 28 Peckman St., Little Falls, N. J., the Carson plastics thickness tester is fully described in a bulletin which will be sent on request.

Glass Drop Dispenser

A DROP dispenser made of glass has been introduced as a new type of closure for bottles containing liquid medicine, by Origination, Inc., 400 North Michigan Blvd., Chicago, Ill. It operates without the aid of a rubber bulb.

Plasticizer

ETHYL cellulose can be plasticized for sheeting, molding, extruding, and for use in lacquer films with a new plasticiser known as Theop, developed by the Glyco Products Co., Inc., Brooklyn, N. Y.

Chemists and Chemical Engineers Needed in the Production Army

PLANT-LABORATORY-CLASS ROOM

ARE YOU AVAILABLE?

Register in the A. C. S. EMPLOYMENT CLEARING HOUSE

Buffalo, New York **September 6–11, 1942**

Open only to members and paid student affiliates of the American Chemical Society registered at the meeting

See CHEMICAL AND ENGINEERING NEWS
This issue, page 1022

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ——▶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

ANALYST for RESEARCH laboratory in wood chemistry, Pacific Coast University, experience in wood chemistry desirable but not essential. Wood, organic, or biochemistry background preferred. Women eligible. $1800–$2000.
Box 20–TP–7, Ind. & Eng. Chem., Easton, Pa.

POST-DOCTORATE research fellowship in physical chemistry at large eastern university. Microcalorimetry of solutions; opportunity for other types of physico-chemical measurements applied to biochemistry. Fellowship renewable. Give details of education, experience, references, etc. $2400 per annum minimum.
Box 28–T–7, Ind. & Eng. Chem., Easton, Pa.

WANTED: METALLURGIST capable of overseeing the production of straight carbon and alloy steel castings, acid electric furnace, steel foundry located in eastern Pennsylvania. In reply state age, experience and salary desired.
Box 57–T–7, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER excellent opportunity for man of outstanding qualifications in research division of food organisation located in the East. Applicant should submit college record, experience, accomplishments, and small photo.
Box 75–TP–7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with good basic training and initiative, for work in dye laboratory in conjunction with production dyeing of stock and piece goods. Experience as dyer desirable but not essential. Must have good "color eye" and knowledge of color matching. In reply give full particulars of training, experience, draft status and salary desired. Eastern location.
Box 12–N–8, Ind. & Eng. Chem., Easton, Pa.

GRADUATE TEACHING and Research Assistantships in Chemistry (three) available. Stipend $550, September 15–June 1, from which some fees are payable. 10 hours' course work permitted each term. In applying include snapshot, list of courses with grades, references. E. C. Gilbert, Chairman, Department of Chemistry, Oregon State College, Corvallis, Oregon.

FELLOWSHIP fat research available Sept. 1–15. $100 per month with remission of tuition fees and laboratory fees in major department. Applicant with M.S. degree and well trained in organic chemistry. Submit complete data first letter including photograph, draft status, religious preference and transcript to R. Adams Dutcher, Department of Agricultural and Biological Chemistry, Pennsylvania State College, State College, Pa.

WANTED—GRADUATE Chemist with laboratory and plant experience in paper coating. Location Middle West.
Box 28–NP–8, Ind. & Eng. Chem., Easton, Pa.

FOOD TECHNOLOGIST. Applications will be welcomed from men with outstanding records to serve as junior chemists in eastern Research Laboratory. Prospects for advancement excellent for men of right qualifications. Please submit record of training and experience, personal history and recent small photo.
Box 76–TP–7, Ind. & Eng. Chem., Easton, Pa.

EDITORIAL ASSISTANT on Chemical and Engineering News to do editing, some rewriting, caption writing, proofreading, production details, and general office work. Several years' college training in journalism and chemistry desired, as well as a knowledge of typewriting and preferably of stenography. State qualifications fully and submit photo. Apply to Industrial and Engineering Chemistry, P. O. Box B, Woods Hole, Mass.

ANALYTICAL CHEMISTS. Inorganic or organic needed by a laboratory that deals with a wide variety of materials. Very large and nationally-known company engaged in War work. Both experienced and inexperienced men will be considered. Applicants should submit educational history, experience, age and a recent photograph.
Box 62–NP–8, Ind. & Eng. Chem., Easton, Pa.

WANTED GRADUATE Chemist with experience in water paste and powder paints.
Box 66–NP–8, Ind. & Eng. Chem., Easton, Pa.

A CHEMICAL SALES organisation handling chemical specialties used by numerous defense industries has an opening in New England for a salesman with a degree in chemistry. Opportunity to acquire part interest in organization. Give draft status, availability, education and sales experience.
Box 14–T–8, Ind. & Eng. Chem., Easton, Pa.

INSTRUCTOR, MAN or woman to teach physical and general chemistry in a midwest denominational college. Excellent opportunity, Ph.D. or equivalent required.
Box 17–T–8, Ind. & Eng. Chem., Easton, Pa.

CHIEF CHEMIST for a middle western defense plant which will operate after the emergency. The chief chemist will have charge of supervision of the laboratory, analytical procedures in the plant and sampling methods, B.S. degree necessary and chemical engineering training preferred. College instructors acceptable. Salary $225.00 to 275.00 per month to start, depending upon experience of applicant.
Box 18–TP–8, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST as research librarian wanted by heavy chemical manufacturer in upstate New York. Must have thorough knowledge of chemistry and ability to read scientific French and German. Library experience helpful. Work consists of literature searches, abstracting, translating, indexing, general library work.
Box 24–T–8, Ind. & Eng. Chem., Easton, Pa.

OPENING IN the middle-west for a spectrochemical analyst to carry on research investigations on the necessity of trace elements in the economy of soils, plants, and animals. Large-sized Littrow-spectrographic equipment available. Full time research. State salary expected and time available.
Box 28–T–8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, to develop resin bonds and glues for the plywood industry. Experience in synthetic resin technique not necessary but must be experienced in methods of plywood manufacture. Give training, experience, nationality, draft status, personal data and recent photo. Varcum Chemical Corporation, Niagara Falls, N. Y.

WANTED: ORGANIC Chemist by College for women located in South. M.S. required, Ph.D. preferred. Rank and salary dependent on qualifications. Woman desired but will consider man. State qualifications and salary expected.
Box 37–T–8, Ind. & Eng. Chem., Easton, Pa.

LARGE MIDWESTERN food manufacturer wants graduate chemist to assist in plant development work. In reply please give full details including draft status and salary expected.
Box 39–TP–8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST CAPABLE of undertaking basic research work on textile fibres. Also technically trained graduate interested in textile development work. Excellent opportunities with well known New England textile company. Salary commensurate with ability and experience. Give all pertinent information and enclose recent photograph.
Box 43–TP–8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER wanted by Mid-West manufacturer of refinery and gasoline plant equipment. Prefer man with operating or design experience. Permanent position open in company handling only high priority business. Reply stating training, experience, salary and include recent photograph. All replies confidential.
Box 49–T–8, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, CHEMICAL Engineer, graduate assistants wanted. Assistant professor of biochemistry and assistant professor of chemical engineering wanted for permanent positions beginning in September. State salary expected and draft status. Graduate assistantships available for work toward M.S. Address applications to L. C. Cady, University of Idaho, Moscow.

ANALYTICAL CHEMIST with Bachelor or Master degree, desired in research laboratory of food manufacturer located in the East. Opportunity for man with sound training and superior college record. Supply details concerning training, experience, personal history and small photo.
Box 51–TP–8, Ind. & Eng. Chem., Easton, Pa.

WANTED: MALE chemist with several years' experience in formulation of industrial enamels for position in product development laboratory at Louisville, Ky. or Malden, Mass. Must have wife and one or more children. Jones-Dabney Co., Louisville, Ky.

WANTED: MALE chemist with several years' experience in development of alkyd resins for position in product development laboratory. Must have wife and one or more children. Jones-Dabney Co., Louisville, Ky.

WANTED: MALE chemist with several years' experience in formulation of pigmented and clear lacquers for position in product development laboratory at Louisville, Ky. or Malden, Mass. Must have wife and one or more children. Jones-Dabney Company, Louisville, Ky.

DIRECTOR of CHEMICAL research and development for rapidly expanding synthetic organic chemical plant. Unusual opportunity. Give full details regarding training, experience, salary. Submit photo (not returnable).
Box 56–TP–8, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS and CHEMICAL engineers for chemical production in a fast expanding chemical plant operating 100% on war production. Give complete details regarding training, experience, salary. Submit photo (not returnable).
Box 57–TP–8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL PRODUCTION manager and also plant engineer wanted for chemical manufacturing plant. Excellent opportunity. Give full details regarding training, experience, salary. Submit photo (not returnable).
Box 58–TP–8, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1082)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

CHEMICAL ENGINEER or chemist interested in control and development work leading to plant supervisory positions; Large plant, Aggressive Company, producing roofing felt, granules, asphalt roofing and asphalt specialties. Give details of education and past experience. Personnel Director, The Flintkote Company, New Orleans, Louisiana.

DEVELOPMENT CHEMIST practical experience manufacture sulfurized fats, soluble oils, E.P. Bases, petroleum additives and petroleum chemistry. Location midwest. Salary approximately two hundred dollars plus bonus arrangement. State experience, draft status, include snapshot, replies confidential. Our employees know of this advertisement.
Box 69–T–8, Ind. & Eng. Chem., Easton, Pa.

WANTED: SUBSTITUTE to teach physical and inorganic chemistry from Sept. 22 to Jan. 31, 1943 at a salary of $160 per month in a college in the New York metropolitan area. Sixteen hours of work per week permits pursuit of graduate work.
Box 73–T–8, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIP, half time, in General Chemistry; woman's college near New York City; prefer woman with master's degree planning graduate work in New York City colleges. Salary $800–1000. Give details of education and experience.
Box 74–T–8, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.S. in chemistry wanted for chemical laboratory in Niagara Falls, New York. Address: The Carborundum Company, Service Department, Niagara Falls, N. Y.

INDUSTRIAL FELLOWSHIP in lubricating oil research available immediately for M.Ch.E. candidate; stipend $600 yearly. Full time research and study. Fee exemption. Bachelor degree in chemical engineering or chemistry required. Address applications to D. F. Othmer, Dept. of Chemical Engineering, Polytechnic Institute of Brooklyn, Brooklyn, N. Y.

CHEMIST with some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventives. State age, draft status, degree, and salary desired in opening letter.
Box 79–TP–8, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL and INORGANIC research Chemist, B.S. with one or two years' research experience, or recent M.S., for essential war research in industrial laboratory. Give full qualifications, training and experience, including salary expected and photograph.
Box 85–TP–8, Ind. & Eng. Chem., Easton, Pa.

WANTED: EXECUTIVE type chemist experienced in synthetic rubber in connection with adhesives. Initiative, imagination and organizing ability necessary for development with a progressive established Massachusetts company. Between 30 and 40 years of age preferred. Salary commensurate with ability.
Box 86–TP–8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST. Experienced, diversified subjects, B.S., M.S., or Ph.D. trained men may apply. Immediate project, electrolytic oxidation, very close to war effort. Send snapshot and complete details in first letter. Midwest location. Excellent future for right man.
Box 96–TP–8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH: Wanted young engineering graduate for Government sponsored research on airplane engine problems. Must be U. S. Citizen. Research experience desirable but not essential. Apply, giving full information, to Engineering Experiment Station, The Pennsylvania State College, State College, Pennsylvania.

FOOD CHEMIST with some experience in bacteriology for research on fishery products in Alaska. Candidate should have a M.Sc. and a minimum of two years' chemical work with fish or other flesh foods. Send full details as to education and experience, draft status, and recent photo to Fisheries Experimental Commission of Alaska, Box 647, Ketchikan, Alaska.

MICROANALYST: WOMAN chemist, preferably with advanced degree, for large research laboratory. Give details and send photograph. Interview can be arranged at Buffalo Meeting.
Box 103–T–8, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SPECIAL LIBRARIES ASSOCIATION will recommend trained chemical and technical men and women librarians at no cost to employer or member. Competent persons are now available. Write to the Executive Office, 31 East Tenth Street, New York, New York, for additional information.

ANALYTICAL CHEMIST M.S. Michigan. Single, 41. Twelve years' experience in explosives, rubber, steel, chemicals, paper. One year government explosives inspector. Had charge of two laboratories. Eastern U.S.A. wanted but will consider other locations. Performed research on inorganic problem. Prefer war work.
Box 38–N–6, Ind. & Eng. Chem., Easton, Pa.

COLLEGE-TEACHING. Ph.D. 1935. Employed. Desires change in position where opportunities in teaching and research are available. Prefer analytical or inorganic. Also physical, organic, chemical microscopy, X-ray crystallography and metallurgy. Nine years' teaching experience. Age 37. Family.
Box 43–T–7, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.A., 1940, Biology and Chemistry Major; two years' graduate work in organic chemistry and biochemistry. Synthetic organic work preferred but am willing to try almost any laboratory work. Single, Protestant, age 24. Eastern states preferred but will consider other locations.
Box 45–T–7, Ind. & Eng. Chem., Easton, Pa.

RECENT B.A. Physiological chemistry: Well-grounded biochemistry, bio-assays, applied physiology, medical, x-ray technology, bacteriology, chemical microscopy, colloids, etc. Prefer to work, learn pharmaceutical-type laboratory or plant but consider others. Excellent personal references. Immediately available. Age 23. 2-A continued if chemist.
Box 78–T–7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S., 1941. Desires position, analytical or otherwise, with plant doing essential war work. Thorough chemical training. Analytical experience in agricultural field. Honor society. Age 23, single, Jewish. Available short notice.
Box 35–N–8, Ind. & Eng. Chem., Easton, Pa.

TECHNICAL MARKET ANALYST Ph.D. 1940. Well rounded graduate training in physical, organic and inorganic chemistry. Limited training in metallurgy. Two years' industrial research experience. Desires position as market analyst for research or technical divisions of well established progressive company. Married, draft status 3-A, Phi Beta Kappa, Sigma Xi. Available on reasonable notice.
Box 37–N–8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH DIRECTOR Ph.D., formerly assistant at Kaiser Wilhelm Institute of Chemistry and University of Paris. 15 years' research experience in organic chemistry, synthetic pharmaceuticals, hormones, alkaloids, microanalysis. Patents and publications. Now director of research industrial laboratory. Desires similar position in large industrial research laboratory or university. Austrian, have first citizenship papers. Married, age 38.
Box 39–N–8, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL ORGANIC Chemist. Ph.D. Nine years' of industrial experience in fundamental and applied research, semiplant operations and technical service on synthetic resins, naval stores and cellulose derivatives. Directing research at present. Trained in chemical engineering and sales. Patents and publications. Age 35, married, one child, Protestant, American, location immaterial. Will consider sales, production or research. Qualified to direct plastic and protective coating program in aviation field.
Box 42–N–8, Ind. & Eng. Chem., Easton, Pa.

SANITARY CHEMIST. M.S. Western university, course work toward doctorate; 13 years' experience sewage research, alkalies, explosives, extensive analytical experience. Prefer West, especially Rocky Mountain region. Married, Sigma Xi, deferred. Publications.
Box 52–N–8, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST, university graduate. Experienced rubber teshnology, research and development. Employed. Excellent record. Prefers position chief chemist small company or head new department in company entering rubber field. East or Midwest. Initial salary $4200. Married, dependents.
Box 55–N–8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: ORGANIC and enzyme chemistry major; physical minor. Research completed at A.C.S. accredited university. Publications. Adaptable, independent, willing worker. Draft deferred.
Box 61–N–8, Ind. & Eng. Chem., Easton, Pa.

TEACHING POSITION, physical or inorganic chemistry, wanted by physical chemist, Ph.D. 1940. Teaching experience inorganic chemistry. Publications. Honor Societies. Age 27, single, draft deferred. Now employed in research, available on reasonable notice.
Box 67–N–8, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST with over twenty years' wide experience in the Food Industry, in direction, research, process development, quality control, and factory problems. Desires a responsible position.
Box 69–N–8, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL RESEARCH chemist now in a specialized electrochemical field seeks a wider opportunity. Has had long connection with one organization. Now in charge of a research unit. Experienced and successful in applied research and process development work. Age 44.
Box 10–T–8, Ind. & Eng. Chem., Easton, Pa.

AGRICULTURAL and BIOLOGICAL chemist, B.S. 1938, Pennsylvania State College. Employed as chemist with large food concern, experience in Bacteriology, Food Chemistry, Manufacturing methods. Desires position with opportunity. Draft deferred, Age 28, married.
Box 13–T–8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 10 years' experience in food inspection, research. Age 35, married one child, Gentile, employed. Available on reasonable notice, location secondary, $3600. Will consider only permanent position.
Box 16–T–8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST Ph.D. 1940 Desires research position. Experience Petroleum Technology, Manufacture of Medicinal white oil and petroleum sulfonates. Publications. Thesis on Friedel-Crafts Reaction. Member Sigma Xi and Phi Lambda Upsilon. Employed. Single, Age 28 draft deferred. Plan attending Buffalo meeting.
Box 19–T–8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WITH twelve years experience in biochemistry and organic chemistry seeks position in defense industry or with organization intimately connected with the war effort. Employed but available on short notice.
Box 20–T–8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 12 years' academic and industrial experience in synthesis, hydrocarbons (Diolepies and derivatives) polymers and resins, publications, patents, languages. Employed, draft status 3-B. Desires responsible research position.
Box 23–T–8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, B.Sc., M.Sc., several years' industrial experience with oils, soaps, waxes, polishes. Desires industrial research or teaching position offering opportunity for research. Masters in physical chemistry. Trained in micro-techniques, physical methods and new analytical procedures. Married, age 27, prefer Northeastern area.
Box 25–T–8, Ind. & Eng. Chem., Easton, Pa.

VISITING PROFESSOR, available for the duration. Experienced teacher of organic, biochemistry, general chemistry. Author of texts and laboratory manuals in general chemistry, qualitative analysis, D.Sc. University of Geneva. See Who's Who. Geo. W. Muhleman, 1450 Englewood Ave., St. Paul, Minn.

ORGANIC CHEMIST, Ph.D. 1940 would like teaching or research position in organic or biochemistry. Experience in chemistry of microorganisms, carbohydrates, organic synthesis, azo dyes. Employed. 2 years industrial. Phi Beta Kappa, Sigma Xi. Publications. Prefer Western U. S. Married, 3-A, age 31.
Box 29–T–8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST EXECUTIVE, currently employed in administrative sales and service. Seeks position as technical assistant to executive, or war production program. Past 45 years of age. Married. Present position 15 years. Minimum salary $400 per month. Location immaterial. 12 Publications. Several years' experience as chief chemist—coal; steel, steel making alloys and allied products.
Box 30–T–8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH chemist, Ph.D., desires Midwest research position in essential industry. Several years' industrial and academic experience in carbohydrates, organic syntheses, enzymes, cereals, microchemistry. Several publications. Married. Deferred.
Box 33–T–8, Ind. & Eng. Chem., Easton, Pa.

MEDICAL CHEMIST, PH.D., Broad experience in technical and scientific research on food products, biologicals and pharmaceuticals. Ten years with medical and hospital supply firm. Research development and business knowledge. New York State or East preferred. References. Available Sept. 1. Class 3-A.
Box 40–T–8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.Ch., and Biochemist, Ph.D., 1942 from large midwestern university. Desire academic or industrial position. Special training in Colloid chemistry. Experience with nitrocellulose and enzymes. Six publications. Age 25, Single. Available immediately.
Box 41–T–8, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST seeks position of greater responsibility. Now employed. Ten years varied industrial experience equally divided between production and research. Ph.D. from reputable university. Aggressive approach to problems in hand. Age 32. Married. Two children. Draft classification 3-A. Available on one month's notice. Can interview prospective employers at Buffalo convention by appointment.
Box 42–T–8, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1083)

(Situations Wanted Continued)

INDEPENDENT THINKING, Bio-organic chemist Ph.D. Good background physical chemistry. Experienced in synthesis of vitamin E, vitamin B_2, intermediates, sulfonamides, stilbestrols, nitro compounds. Isolation and study of many enzymes and other natural products. Research in surface chemistry. Honor societies, publications. Age, 26. Draft deferred. Seek research position.
Box 44-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL and METALLURGICAL Engineer, Ph.D., age 39, married, 17 years' experience in recovery of zinc, copper, nickel, cadmium by smelting, wet chemical or electrolytic processes, and in manufacture of salts of non-ferrous metals. Employed, but available on short notice. Desires better opportunity in plant, research or development work.
Box 46-T-8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, Ph.D. 14 years' extensive research experience in physical chemistry and biochemistry. Several years' industrial research and development (pharmaceuticals). 26 publications. Patents. Desires more responsible and promising position. Married. 36 years. Draft deferred. Will attend ACS meeting in Buffalo.
Box 47-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST—ESSENTIAL oils, aromatics, etc. B.Sc. (Chem.), graduate work, publications, 8 years thorough experience in research, development, production and control. Was chemist-in-charge of the laboratory of leading essential oil company. Expert in field. Married, age 31. Draft 3-A. Available immediately.
Box 48-T-8, Ind, & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST Ch.E. Twelve years' experience in industrial research and development work. Largely responsible for development and operation of several profitable processes. Married, age 34. Available within reasonable notice.
Box 60-T-8, Ind. & Eng. Chem., Easton, Pa.

UNIVERSITY PROFESSOR experienced in teaching general chemistry and in research is willing to consider a change. Minimum acceptable salary $4000.
Box 61-T-8, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, B.S., M.S., just completing Ph.D. requirements. Pharmacology and physical chemistry minors. Taught four years. Rho Chi, Sigma Xi. Married, Lutheran. Attending Buffalo meeting.
Box 62-T-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.A. degree. 5 years' experience in development and synthesis of fine chemicals. Employed but available within reasonable notice. Married, dependents.
Box 63-T-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S., 28, married, one child, 3-A. Personable, responsible. Excellent organic training. 3 years' research and industrial experience. Desires organic research or development position in Chicago area. Now available.
Box 70-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER (Ch.E.), young man, three years' laboratory and plant experience, sixteen years' industrial sales. Loyal, enthusiastic, industrious. Can translate technical data understandingly to the layman. Effective speaker, writer, organizer. Authority chemical defense. Available immediately. Desires position to serve Nation more effectively.
Box 71-T-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST—Chemical Engineer; B.S. 1939; M.A., 1940 in organic and analytical. Two years' graduate study toward Ph.D. including organic research. Want responsible position in an "essential industry" or university teaching. Unmarried, good health. Draft classification 2-A; available immediately.
Box 72-T-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 1935, six years' hydrocarbon research and development; Gasoline finishing, blending. Product and process improvement. Semi-scale quality fractionation producing high octane blending agents. Group leader alkylation, isomerisation. Directive ability. Married, age 35. Desires responsible position.
Box 77-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 11 years first class experience, engineering and process work in organic chemicals, petroleum refining and equipment application design. Desires responsible engineering work. Draft exempt, 33 years old, 3 dependents.
Box 80-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. Degree, 18 years' experience petroleum refining, 14 years in charge of laboratory of complete refinery. Experience ranges from gas analysis to lubricating oil and wax manufacture.
Box 78-T-8, Ind. & Eng. Chem., Easton, Pa.

SPECTROSCOPIST, experienced in spectrochemical analysis, also analytical chemistry. Capable of setting up spectrochemical laboratory for control or research. Desires position setting up new spectrochemical laboratory or supervising such a laboratory already installed.
Box 84-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL and INDUSTRIAL microscopist, and metallographist. Would like to organize or supervise a microscopical laboratory for research, new products development and application, process and product improvement. Ph.D., major in physical chemistry, minor in microscopy, Cornell. Fourteen years in research laboratories of the largest companies in two industries, five as research chemist, nine as microscopist dealing with a great variety of problems and materials; shorter periods in two other industries; experience with metals includes thesis and recent work on magnesium alloys. Sigma Xi. Married, two children, 42. Employed.
Box 87-T-8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, 16 years' experience industrial fermentations, foods and drugs. Desires responsible position research and development. Age 39, 3-A draft classification. Numerous publications and patents.
Box 88-T-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1938 leading mid-western university. 30, draft 3-A. Main experience synthesis of ephedrine vitamins A_1B_2. Imaginative, resourceful capable of directing work. Cooperative. Languages. Employed. Desires position where superior synthetic abilities required, preferably pharmaceutical industry. Attend Buffalo meeting.
Box 93-T-8, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D. 1941. Diversified experience in organic and inorganic chemistry. Desires research, development or production work with progressive company along Eastern coast. Married, age 25, draft 2-B. Employed, available reasonable notice.
Box 94-T-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., with B.S. in chemical engineering. Seven years' diversified research and development experience in petroleum and allied fields of organic chemistry. Experience in polymerization, cracking, oxidation inhibitors, catalysis, alkylation, cresylic acids, hydrogenation, x-ray diffraction, etc. Laboratory fractional distillation and high pressure and temperature equipment design and operation. Publications and patents. Unmarried, age 30, draft 2-B. Available on reasonable notice. Will be at Buffalo Meeting.
Box 97-T-8, Ind. & Eng. Chem., Easton, Pa.

DIRECTOR, RESEARCH or laboratory. Executive ability to direct staff and to apply original work and processes, on products inorganic, organic, biological, etc., to ethical pharmaceuticals, Drugs and Allied Lines. Pharm.D. extensive training and long experience. Wishes director position or assistant to technical executive.
Box 102-T-8, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

CHEMICAL ENGINEER, 12 years' experience organic chemical plant planning, layout, equipment design, piping, specifications, equipment selection, supervising plant operations, etc. Capable taking complete charge of projects, or supervising production. Good practical knowledge of process operations. Desire permanent connection with responsibility. American. Protestant. Married. Age 37.
Box 66-T-7, Ind. & Eng. Chem., Easton, Pa.

ENGINEER, ELECTROCHEMICAL, M.I.T. 3 years' experience Electrochemical, Chemical and Electrical Engineering. Good working knowledge of Metallurgy, Production Methods, Time Study and Motion Economy, and Safety Engineering. Will go anywhere.
Box 15-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, MASTERS degree accredited Western college, now employed desires change. Three years' experience in raw materials and petroleum specialties. Age 27, single, white. Draft 4-F. Particularly interested in Northwest or Intermountain states.
Box 34-T-8, Ind. & Eng. Chem., Easton, Pa.

PHYSIOLOGIST, also experienced in biochemical research. Ph.D. Married. Now employed in large city. Would especially like post where it would be practical to live in suburbs or small city.
Box 67-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 29, B.S., Ch.E. Five years' experience; organic acids; organic vapor phase catalysis, edible oils; research, analytical and plant experience; employed, seek position with some responsibility; draft deferred.
Box 92-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST EXPERIENCED in industrial research, development, production and control. Vitamins, oils, agricultural by-products. Broad education and mechanical background. Adaptable, energetic, pleasant. Age 30, married, child. Now employed in east, desire to return to west coast.
Box 95-T-8, Ind. & Eng. Chem., Easton, Pa.

TECHNICAL RESEARCH librarian. Young woman, age 22, graduate of recognized college (A.B.-1940). Chemistry major with two years' experience in abstracting, searching, etc. Can translate French and German; knowledge of typewriting; able to accept responsibility; accurate and conscientious worker; satisfactory references. New England preferred.
Box 101-T-8, Ind. & Eng. Chem., Easton, Pa.

Lucite Oil Viewer and Filler Cap

METAL is replaced and practical advantages offered by a one-piece oil viewer and filler cap molded of Lucite methyl methacrylate resin for the latest line of McCormick-Deering cream separators. The transparent plastic part allows the operator to see at a glance when oil should be added to lubricate the mechanism of the separator. One-piece construction eliminates the assembly of glass and metal and the possibility of leakage. The part is molded for International Harvester Co. by Chicago Molded Products Corp. from Lucite produced by the Plastics Department of the du Pont company, Wilmington, Del.

High Wet-Strength Filter Paper

A NEW high wet-strength filter paper, No. 755-2, has been developed by D. R. Sperry & Co., North Aurora, Ill. The new paper is used over filter cloth, in the same way as is the No. 755-1, but has the advantage of being suitable in cases where the filter cake or residue is saved. The trouble of lint adhering to and contaminating the cake is said to be overcome with this paper. The paper, it is claimed, will not tear or disintegrate on removal. At present it can be supplied up to 24 inches wide only.

Lucite Lens

TO ENSURE accurate cutting of tapered metal parts turned on a lathe and to boost production yields for military equipment, one company has installed a magnifying lens of Lucite methyl methacrylate resin on the taper attachment of its lathes. The Lucite lens magnifies the gradations and assists the operator in cutting tapers to within one ten thousandth of an inch or less.

It is made for Monarch Machine Tool Co., Sidney, Ohio, from Lucite produced by the Plastics Department of E. I. du Pont de Nemours & Co., Inc., Wilmington, Del.

Navy "E" Awards

THE prized Navy "E" award for industrial achievement has been presented to the Bound Brook, N. J., plant of Bakelite Corp. for excellence in production of Vinylite and Bakelite resins and plastics. This honor has also been awarded to the Wyandotte, Mich., plant of Halowax Corp.

MISCELLANEOUS

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests. Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 148 Fifth Avenue, New York, N. Y.

RUSSIAN and POLISH scientific literature and patents translated into first class idiomatic scientifically accurate English. Estimates cheerfully given on photostatic copies submitted. Interested librarians please contact for future reference.
Box 11-T-8, Ind. & Eng. Chem., Easton, Pa.

AN OPPORTUNITY—to purchase a small chemical company specializing in the manufacture of certain products for the leather industry. The business is highly profitable and is being placed on the market to close an estate.
Box 36-T-8, Ind. & Eng. Chem., Easton, Pa.

COLLOIDAL ASPIRIN
U. S. P. 2,293,359

The owner of this patent will entertain offers from firms having at least B-2 rating in Dunn and Bradstreet.

Box 89-T-8, Ind. & Eng. Chem., Easton, Pa.

COMPLETELY EQUIPPED analytical and research laboratory. Specializing on food, bacteriological work, brewing research and water analysis. Established clientele. Selling entire business including furniture, equipment, etc., account of illness.
Box 98-T-8, Ind. & Eng. Chem., Easton, Pa.

WANTED: Water bath and shaking mechanism for Barcroft Warburg respirometer, with or without manometers. Department of Bacteriology, New York University College of Medicine, 477 1st Ave., N. Y. C.

WANTED—VISCOSIMETER, Stormer, MacMichael or Gardner-Holt of type for heavy oils. Also will buy DeLaval Separator #600 or larger, must have separator type head giving double discharge. Thompson-Hayward Chemical Company, 2915 Southwest Boulevard, Kansas City, Missouri.

WANTED: 1 only copy Chemistry of the Pyridine Compounds by Maier-Bode. Purchasing Division c/o Post Office Box 271, Linden, New Jersey.

WANTED: INDUSTRIAL & Engineering Chemistry; Industrial edition only. Vol. 1-33 incl. Unbound. Covers may be slightly torn if inside pages are in first class condition. Shelton McAnelly, Magnolia Petroleum Co., Dallas, Texas.

WANTED TO BUY, sell your equipment you no longer need or surplus. We have hundreds of inquiries from chemists institutions, industrial and testing laboratories doing war work who are in great need for the equipment which is unavailable at present new. Why not pool all unused equipment instead of standing idle. We will gladly send you our lists of available equipment if exchange is desired or will buy outright at the very fairest possible market prices. Act now and send us your lists of all equipment which are idle. Immediate quotation will be given on all offerings. Write or wire The Laboratory Exchange, 24 E. 21st St., N. Y. C.

ANALYTICAL CHEMIST and Metallurgist has complete laboratory equipment and apparatus for sale. Write for inventory, to W. E. Grainger, % Mrs. F. T. Emory, 306 Mimosa Ave., Knoxville, Tenn.

FOR SALE: Chemical Abstracts, vols. 1-35 complete, unbound; good condition; marginal pencil marks certain sections. $350.
Box 21-T-8, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Coleman Universal Spectrophotometer complete for operation at 8 or 10 volts, with U V illuminator, battery charger, cuvettes, cuvette carriers and filters. In use only six months. Laboratory closing for duration.
Box 32-T-8, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: unbound, excellent condition Chemical Abstracts, Vol. 25, 26, 27, Journal American Chemical Society, Vol. 53, 54, 55. Separately, $6 per volume, or make me an offer on the lot.
Box 35-T-8, Ind. & Eng. Chem., Easton, Pa.

For Sale

PURE BETA CAROTENE

$E^{1\%}_{1cm.}$ (480 m u) = 2270 n Skellysolve B m.p. 180° C. (Corr.)

Contains less than 0.02% alpha carotene

10 mg. tube $5.00 100 mg. tube $40.00

Nutrition Laboratory, Auburn, Alabama

FOR SALE: 100 pounds each: Agate, Alabaster, Allanite, Arsenopyrite, Bentonite, Chalcopynite, Columbite, Hematite Massive, Malachite, Pyrrhotite, Rhodonite, Samarskite, Euxenite, Wolframite Massive, Wollastonite. 50 pounds each: Apatite, Carnotite Calamine, Cerite, Molybdenite, Monazite, Polycrase.
Box 90-T-8, Ind. & Eng. Chem., Easton, Pa.

FOR SALE. Chemical Abstracts, 1907-1940, vols. 1-34, complete with three Decennial Indexes, all bound in brown buckram, also 1941 unbound. Excellent condition. F.O.B. Cambridge, Mass. $600 cash with order. Reference furnished. Willis A. Boughton, 12 Oxford St., Cambridge, Mass.

FOR SALE: "Journal, American Chemical Society": 1901-1919, bound, bindings fair 18 years $72; "Chemical Abstracts": complete set with all 3 Decennial Indexes bound; "Cereal Chemistry": Vols. 1-11 bound; "London Chemical Society, Journal": 1890-1940; "Electronics": Vols. 1-14; "Journal of Pharmacology and Experimental Therapeutics": Vols. 1-76 bound; "Proceedings, Society for Experimental Biology and Medicine": Vols. 1-50, bound; "Chemical Reviews": Vols. 1-15; "Journal, American Ceramic Society": Vols. 1-22; "Transactions, American Ceramic Society": Vols. 1-19, bound; "Industrial and Engineering Chemistry": complete set, mostly bound. A. Calvert, 221 Seaman Avenue, New York, N. Y.

WE OFFER: 10 pounds Tungsten Metal 99.99% pure. 10 pounds Vanadium Metal 96%. 10 Kilos Germanium Metal, 5 Kilos each, Indium, Lithium, Molybdenum, Titanium, Zirconium, Metals. Kilo each, Uranium and Thorium, 100 pounds, Ferroboron, Ferrouranium.
Box 91-T-8, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Five gallon stainless steel autoclave, 2000 pounds working pressure, anchor type agitator, with 1.5 horsepower variable speed direct current motor enclosed metal cabinet; 2 horsepower automatic gas fired Dowtherm boiler; Taylor recording pressure gauge, Leeds and Northrup two point temperature recorder. Price $2500.
Box 66-T-8, Ind. & Eng. Chem., Easton, Pa.

WE OFFER: 100 pounds Pure Sodium Cacodylate, 25 pounds Iron Cacodylate, also Cholic acid and Salts, Histidine and Histamine compounds, d-Ribose, Ninhydrin, Lysine, Glucosamine HCl, Digitonin, Dehydroxyacetone, Levulinic acid, Boron Trichlorids.
Box 83-T-8, Ind. & Eng. Chem., Easton, Pa.

FOR SALE—immediate delivery; no priority needed; fully guaranteed equipment; now available: (2) Scott Tensile strength testing machines motor driven with recorders, Mullen paper testers, Suter single strand tester, International centrifuges, Zeiss Sugar Refractometer, B & L Dipping Refractometer, B & L Chemical microscope, Spencer and other fine research microscopes, B & L Dubosq colorimeters, Spencer rotary microtomes, clinical microtomes, Freas drying ovens, incubators, horisontal autoclaves, Hanovia quartz ultra violet lamp, Leits polarising projection microscope for research, cement compression press, Schmidt & Haensch precision double wedge saccharimeters, analytical balances, Torsion scales, etc., priced according Government regulations or lower wherever possible. Send us your needs for immediate quotations no matter what the equipment is we may have or can obtain for you. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

Molders of a Better Destiny[1]

CHARLES M. A. STINE

Vice President, E. I. du Pont de Nemours & Co., Inc., Wilmington, Del.

IN FIGHTING a war, the all-absorbing intent is to win. There is little time to analyze the rush of events or to appraise their consequences beyond the war's end. The united objective is, rightly, success for our arms.

Yet under the pressures of a great war there may be compressed scientific, economic, and social developments that might have taken many decades to achieve under less urgent conditions. Their effects on our lives and all civilization may be more wide-reaching and lasting than any military conquest. They constitute one of the most imperative incentives to victory.

No American, least of all any scientist worthy the name, conceivably could endorse war as a justifiable means to progress. The destruction of life and property wrought by the present war far exceeds the havocs of a century's earthquakes. Most of mankind is burning itself on an altar of paganism.

Nonetheless, one fact is inescapable. Despite the recurrent malady of war, history's over-all course is forward. Mankind has the habit of rising phoenixlike from its own ashes to attain greater heights. Progress is immortal.

We emerged from World War I with a wholly new concept of our possibilities. For the first time we began clearly to see that when the Creator conferred upon man freedom of choice and action, there were placed in man's hands the tools with which he could shape his destiny and modify his future. We learned that it was possible not only to emulate Nature but even to excel her in certain fields of creation. We were shocked at how little we knew, and at how meagerly we had advanced in the light of what was still to be accomplished.

The new nation—and it was no less—that was built on this continent following 1918, largely as a result of the war-broadened vision, would have seemed a fantastic wonderland in 1914 had anybody then had the imagination to predict it.

The automobile came of age; aviation was established as a potent industry; the "wireless" of war days became "radio", and radio approached the miraculous in the marvel of television. Add to these the gigantic expansions realized by the telephone, the motion picture, and rayon, all three of which were undeveloped infants in 1914, and you have a combination of influences truly staggering in their effects upon American life.

One of the greatest migrations of all time took place as millions moved from farms to cities and more millions from cities to suburbs. This mighty trek, made possible by improved transport, better highways, and opportunities for more lucrative employment, paralleled further drastic changes in our traditional economy. We had led the world in agriculture; we now led it also in industry. Mass manufactures superseded the handicrafts almost to their extinction.

Meanwhile, the American woman had taken her destiny into her own hands. In 1914 she wore long skirts, cotton stockings, whalebone stays, and her "place was in the home". She came out of the war with a declaration of feminine independence that has since taken her to Congress, into the Cabinet, and into almost every activity once sacred to man, including the military. In less than a decade she cut the bonds of centuries and destroyed for all time a hundred circumscribing taboos. Only the future historian can assess the full impact of this new freedom upon the family, the community, and the Nation. It was undoubtedly speeded to fruition by World War I.

There were other advances. When we, the American people, on December 7, 1941, found ourselves again at war on a global scale, we were living on a plane that bore but little resemblance to the prewar period of a quarter century earlier. Our clothes, our food, our homes, were different. The character of our work was changed. Our environment and thinking were those of a new age.

Millions of dollars had become hundreds of millions in our national planning. Private industry risked tens of millions on ventures that earlier would have commanded hardly a tenth as much. Hosiery and furniture alike were being made from coal, water, and air; dresses from wood, farm fertilizers from the atmosphere, camphor from pine stumps. These and many other achievements of chemical synthesis had altered or made obsolete trade practices and customs as old as the race.

Moreover, the scientist was just getting started. Tens of thousands of new chemical compounds and metallic alloys awaited his full exploration. We were speculating on the eventual conquest of disease. The elimination of poverty, at least as a social problem, was considered a goal that well might be realized. And, as organic chemistry was the source spring of a major share of the infinitude of changes that inspired such hopes, the influences of World War I could be very definitely traced here also. Our organic chemical industry in the United States grew directly in answer to needs violently made evident by that war.

It is unnecessary to detail to chemists what has happened in chemistry since 1914. That year, a mere handful of 528 workers made up the Nation's total employment in the production of coal-tar chemicals. American-made dyes were not even listed in the official census reports. Our farmers had to buy German potash and Chilean nitrate. Our physicians looked to Europe for important drugs,

[1] Address delivered at the public meeting of the 104th meeting of the AMERICAN CHEMICAL SOCIETY, at Buffalo, N. Y., Monday evening, September 7, 1942.

sutures, and optical glass. All science looked to Europe for leadership.

Indeed, it was a simple, almost a scientifically primitive economy in which we Americans then lived. On all the seven seas, America-bound ships heavy with goods and raw materials testified to our dependency on foreign lands. The homes in which we lived differed little from those of our great-grandfathers; the tailors of the Cæsars knew the textiles of which we made our clothes; the finishes of our 1914-model horseless carriages dated to ancient Egypt and the building of the Pyramids. All steel rusted. The best rubber tires were worn out after about 3,000 miles of highly uncertain road service.

One shudders at what might be our plight if those were the tires of today, or if by some colossal blunder we had failed to establish an organic chemical industry in the United States as a consequence of that other war's bitter lessons.

Thank God, we did establish a chemical industry!

We did more than that. We established a nation-wide common consciousness of the power of science in every branch of American industry. Steel, textiles, transportation, foods, oil, in fact every basic producer, came to the turn in the lane where all signposts of progress pointed in one direction—to the research laboratory. We did not get there all at once, but most of us got there long before German hob-nailed boots were pounding over the streets of Warsaw.

Expenditures for industrial research in the United States rose from an inconsequential sum yearly in the pre-World-War-I period, to an amount estimated at $300,000,000 yearly in the pre-World-War-II period. The number of research laboratories grew to more than 2,000. Huge sums were spent in expanding technical and scientific schools to meet the demands of our awakened youth. The number of doctorates granted in chemistry alone was multiplied by 20 or 30 times.

I am not implying that all research is chemical or that chemistry provides the one Aladdin's lamp which all scientists must rub. However, let chemistry be ignored and the other lamps become lifeless brass. Perhaps the greatest benefit that has come to America from our chemical awakening is the renascence of all science that has accompanied it. The chemical synthesis of vitamins, for example, to say nothing of hormones and the sulfa drugs, not only is revolutionizing medicine and dietetics but putting these sciences on incomparably higher planes of performance and future promise. And at the opposite extreme of the pendulum's swing, the modern long-range bomber, while a machine, is also a composite chemical triumph expressed in metals, plastics, and liquids.

The famous tribute paid Washington—first in peace, and first in war—might be paid with equal justice to chemistry. Its record during our other world war is history. Its contributions to the Nation's progress during the peaceful years of the '20's and '30's, while the organic chemical industry grew to maturity, helped crowd into those years many of the most notable advances that mankind has gained since civilization began.

Now, we are again at war. With the full strength and vigor of its young manhood, the chemical industry is fighting again for an American victory and an American peace. To this task it has dedicated itself wholly.

And we hear questions: Is the fight worth while? Will a victorious peace be worth the price that all too evidently we will need to pay for it? After victory—what?

My answer is that now, today, even as I speak, the pressures of this war are compressing into the space of months developments that might have taken us a half century to realize if necessity had not forced the pace.

Those pressures are unprecedented. The developments are unprecedented. Give us a victorious peace and the freedom of enterprise it should guarantee, and our progress will be unprecedented!

One does not need to venture into prophecy to sketch the bold lines of what that progress can be. They have already been traced. Already our world of 1940, in which we took such pardonable if mistaken pride, is so distant in the past that it has become an antiquity, as seen through scientific eyes. The inconceivables of two years ago are today's realities.

More than a century was consumed in bringing the crude rubber production of the world up to 1,000,000 tons yearly. The United States alone is now undertaking to accomplish almost as mighty a feat in less than two years, by the manufacture of chemical rubbers from petroleum, alcohol, and coal and limestone.
